BRADBURY AND EVANS, PRINTERS, WHITEFRIARS.

INDEX OF CONTENTS

TO THE

GARDENERS' CHRONICLE AND AGRICULTURAL GAZETTE,

For 1844.

A

Abies religiosa, hardiness of, 335; — Douglasii at Moniack, death of, 573
Abutilon striatum, 104; vitifolium, 799
Acarus hortensis, 316
Achimenes pedunculata, 7; grandiflora, 8
Acer rubrum, 276
Acorns as food for pigs, 699, 772; their use, 830
Acorus Calamus, 798
Adelaide, Table of the Weather at, for 1842, 319
Adulteration of Wheat flour, 386; of manures, 222, 259, 301, 377, 393, 416, 453; of guano, 485, 774.
Aerides virens, 574
Alluvial inclosures, 14
Agriculture, its practice with profit, by H. Newnham, rev., 661; in New South Wales, by J. Atkinson, rev., 237; in France, 142; application of science to, 610; mechanics applied to, 219; anomalies of, 690, 705, 769, 737; lectures on, by A. Petzholdt, rev., 719; by G. Cox, rev., 767; Davy's, by J. Shier, rev., 734; relative position of, 786; of Norfolk, by R. N. Bacon, rev., 789; Application of Geology to, by N. Whitley, rev., 141; Scotch, 170; Manx, 58, 122, 130; and geology, 234, 249, 266; in China, 220
Agricultural colleges, 14; education, 27, 30, 49, 301, 341; value of land, 57, 73, 89; improvements, 155, 221, 281, 413, 434, 487; ditto in modern husbandry, 109; experiments, 363, 857; leases, 341; implements, 449, 466, 641; ditto, to preserve, 723; implement clubs, 709; implements, adv., Wedlake, 175; chemistry association, 469, 489, 724; plants, composition of, 249; mechanics, 609; remarks on, 577, 689; societies, advantages of, 625, 747; weeds, 302; chemistry, by J. F. W. Johnson, rev., 470; Grasses of Ireland, by D. Moor, rev., 198; college at Cirencester, 308, 469; improvement, capabilities of, in Hampshire, 596; chemistry, remarks on, 804; co-operation, 9, 77; character of coal, 691; of fullers' earth, 577; of limestone, 722; of marlstone, 593; of millstone grit, 691; of red sandstone, 644, 754
Agricultural Gazette, prospectus of, 9; 1st vol. of, 873
Agrimony, remarks on, 412
Agromyza violæ, 244
Air necessary for roots of plants, 30
Alexandra imperatricis, 718
Alkali as a manure, by H. Waterton, rev., 157
Allotment system, 203, 489, 563, 612, 628, 642, 875; beneficial effects of, 877; remarks on, 645, 673, 689, 705, 707, 740, 756, 771; in Ireland, 755; cottage, 593; tendencies of, 377; effect of, 835; objections to, 839
Almond a fruit for the dessert, 765
Alona cælestis, 622
Alpaca of Peru, 420; to naturalise, 550; Walton on its naturalisation, rev., 613
Alum, to manufacture, 598; as manure, 724
Amateurs' Melonry, 295, 357; forcing pit, 732
America, Central, some of the productions of, 871
American plants, 276; tree and shrub seeds, adv., Charlwood, 178; Phillips, 193; notes on, 501, 831, 854
Amherstia nobilis, 21
Ammonia, to fix, 46, 78, 253, 451, 489, 505; in liquid manure, 486; by gypsum, 467, 722, 742, 786, 860; by salt, 187; by sulph. acid, 467; fixers of, 571; as manure, 364, 592
Ammoniacal liquor as manure, 579
Ammophila sabulosa, 731
Analyses, of peat ashes, 738; of Dutch ditto, 658; of Beech ashes, 547; of Potato ashes, 559; of ashes of herbaceous plants, 578; of turf ashes, 803; of bran, 467, 512; of soils, 27, 188, 805; importance of, 612; of guano, 708; of Potter's ditto, 645; of hay, 676; of limestone, 140; of mountain ditto, 722; of loam, 415; of the Onion, 612; of the Raspberry, 133
Andromeda phyllireæfolia, 637
Anemones, treatment of, 56; culture of, 184; select, 248
Anemone obtusiloba, 871
Animals, at various ages, 285; at different ages, risk attending the possession of, 366; useless, 804
Animal Nutrition, M. Boussingault's experiments on, 785; remarks on, 860, 875
Anisoplia horticola, 700
Annoyances, 229
Annuals, adv., Masters, 129
Anomalies of Agriculture, 690, 705, 769, 737
Ansted on Geology, rev., 870
Anthonomus pomorum, 555
Anti-fraud League, 393
Antiquities of gardening, 832
Ants, to destroy, 464, 477, 504, 589
Aphis on Peach trees, to kill, 149, 200
Aponogeton distachyon, 135
Apple-pips, to sow, 320
Apples, select, 168; Sturmer Pippin, adv., 161; Beefin, remarks on, 166; Ashmead's kernel, 264; Golden Pippin, 390, 749; decay of, 797, 813; orchards in Devonshire, 636; Scotch Leadington, 782; for the North of Scotland, 856; productive variety of, 870; Ribstone Pippin, 832; diagram of the original tree, 812
Apple-trees, to kill Moss on, 656
Apple tree, Mussel or Dryscale, 427
Apple-blossom weevil, 555
Apricot-tree, to bring into bearing, 24
Aquatic plants, management of, 300, 672
Araucaria imbricata, adv., Youell, 1; excelsa, adv., Marnock and Manley, 81; to strike, 448
Arbor-vitæ, 276
Arctostaphylos pungens, 183
Arrow-root, remarks on, 387
Arum maculatum, poisonous effects of, 398
Artificial fertilisation, 215
Asclepias tuberosa, 832; quadrifolia, 832
Ashes, Dutch peat, analysis of, 658; of soap boilers as manure, 627; peat as, 644; of Beech, &c., analysis of, 547; of the Potato, analysis of, 559; of herbaceous plants, analysis of, 578; as manure, 819; of turf as manure, 803; analysis of, 803
Asparagus, culture of, 168, 667; to plant, 276; salt for, 317, 334, 429, 505; effect of, on, 444 589, 685; to apply to, 524, 605, 621; to prepare ground for, 544; Potter's guano for, 261, 406, 430, 656
Asphalte roofing, 40; adv., Croggon, 47; paths, 245
Asphalte, covering for Vine borders, 688
Attelabus curculionoides, 179
Auriculas, canker in, 22, 280; seedling, 133; to save seeds of, 357; robbery of, 718
Aviary, birds for, 181
Ayrshire Agricultural Association, 124
Azaleas, hardy kinds, 72; list of, 800

B

Backhouse's visit to the Mauritius and South Africa, rev., 482
Bacon's Report of the Agriculture of Norfolk, rev., 693, 789
Balsams, 197; list of, 608
Bank Farm, Kingston, Gardens at, noticed, 463
Bar and Frame Bee-hive, by W. A. Munn, rev., 431
Barbacenia squamata, 338; Alexandrinæ, 718
Bark, price of, 200
Barley, to hybridise, 532; Egyptian, 612; crop, remarks on, 673; do., to secure, 721; culture of, 706; mildew on, 756
Bathstone, agricultural character of, 561
Beans, time for sowing, 121; and Cabbages to grow together, 598; culture of, in East Lothian, 739
Beech, to graft, 392; purple, 216
Beefin Apple, 166
Beehive, adv., Neighbour and Son, 223; Grant's, 333; Nutt's, 334; Munn's, rev., 431
Beehives, remarks on, 797; Bagster's, 152, 872
Bee flowers, 334, 430; French (Buck) Wheat, as, 766
Bees, remarks on, 5, 20, 51, 181, 197, 232, 261, 373, 374, 389, 405, 429, 445; management of, 37, 853; in New Zealand, 53; mode of killing drones, 524; query cure for sting of, 541; feeding of, 68, 102, 118; sting of, to cure, 445, 558, 589; pasturage of, 83; fecundity of, 572; to destroy, 99; eggs of, 605, 638, 702; how they collect pollen, 102; Bagster's hives for, 152; to transport, 149; sleep of, 430; mode of taking, 668; management of, 477, 504; straw hive of, weight of honey in, 766; profits of, 833; hives for, 872
Beet, culture of, 184; to dibble, 252, 268; Brazilian, 591; White, 767
Benenden tile-machine, 520
Berberis pallida, 183; trifoliata, 277; tenuifolia, 375; umbellata, 591
Berberry, blight on corn, 12, 44, 60, 92
Bibio Marci, 764
Bigg's sheep-dipping composition, 304, 708
Bignonia venusta, 8; grandiflora, to prune, 720; management of, 813
Bird-architecture, by J. Rennie, rev., 670
Birds for an aviary, 181; eggs, 245; eggs, to preserve, 261; remarks on, 277, 703; small, destruction of, 685, 766, 832, 870; mode of destroying Tomtits, 869; to keep off Gooseberries, 854; to keep off seeds, 383; Canary, fecundity of, 654
Birmingham Botanic Garden, noticed, 574
Bitter Aloes a preventive of mice, 749
Blackbirds, remarks on, 703
Black horseponds, 301, 322, 342, 361, 378, 393, 414
Black-legged coral weevil, 179
Blight, American, 116; do. to kill, 816, 133, 405
Blue titmouse, insects killed by, 101
Boilers, remarks on, 316, 430; conical, adv., Stephenson, 2; Shewen, 37; Burbidge and Healy, 37; remarks on Stephenson's, 870
Bokhara Clover, 702; culture of, 766
Bolbophyllum macranthum, 215
Bones for Turnips, 28; fertilising qualities of, 74, 107, 123; dust, 307, 361, 364, 435; to apply, 78; to Turnips, 282; remarks on, 91, 183; scarcity of, 107; cheap method of bruising, 108; as manure, 415, 707; substitute for, 344; and sulphuric acid, their action, 94
Book of the Farm, by H. Stephens, rev., 45, 709
Books, botanical, list of, 800
Borax in bread, 783
Borthwick's tree-pruner, 566
Bossiæa paucifolia, 23
Botanic Garden, Regent's Park, noticed, 71
Botanical works, 71; collectors, hints for, 637; lecture at Shoreditch Church, 765, 796; news, 215, 263
Botany, Linnean, 213; of the voyage of the Sulphur, rev., 70, 230; of H.M.'s discovery ships in 1839, by J. D. Hooker, rev., 416
Bottom-heating, Mr. Errington's remarks on, 51
Boussingault's experiments on animal nutrition, 785; remarks on, 860, 875
Boys, to employ as farm labourers, 680
Brachycome iberidifolia, 136
Bran, analysis of, 467, 512
Brazilian Beet, 591
Bread, borax in, 783
Breeder Tulips, remarks on, 371
Brewing, remarks on, 766, 782, 814, 852
Brougham's Dialogues on Instinct, rev., 782
British Association, meeting of, 718, 734, 750
British Crustacea, by T. Bell, rev., 815
British Fossil Mammalia and Birds, by Prof. Owen, rev., 167
British Farmers' Almanack for 1845, rev., 846
British Oak, 450
Broccoli, Hammond's Cape, 38, 53; remarks on, 264; Chappell's cream, 279; Walcheren, 248
Bromheadia palustris, 298
Broom Corn (*Sorghum saccharatum*), 306
Brugmansia parviflora, 504; floribunda, treatment of, 523
Brunsvigia Josephinæ, 412
Brussels Sprouts, degeneration of, 835
Buckwheat, to sow, 78
Budding, adhesive plaister for, 429
Burchellia capensis, to strike, 280
Burger's Farming, rev., 12
Burnt clay, action of, on soils, 85; remarks on, 172
Burthens on land, 93
Bury Hill, gardens at, noticed, 607, 670
Butter, flavour of, 92; manufacture of, 534

C

Cæsalpinia coriacea, 7
Cabbages, to sow for agri. purposes, 550; to store, 660, 692, 757; to harvest, 707; Couve Tronchuda, 701; clubbing in, to prevent, 640
Cacti, to sow seeds of, 88; cultivation of, 372
Cactus speciosissimus, 24
Calanthe masuca, 654
Calceolarias, treatment of, 24; select, 200, 794, 856; treatment of, after blooming, 798; seed, to sow, 232; adv., Major, 194; viscosissima, to strike, 718
Calcutta Botanic Garden, 371, 815
Calves, to rear, 550
Calycophyllum Stanleyanum, 718
Camellias, to inarch, 8, 412; buds dropping, 56; sativa, 94; to graft, 232; soil for, 264; to naturalise, 275; to cut down, 280; adv., Hally, 162; management of, in the open air, 836; spot in, 24
Campbell's corn-steep, 57, 860; results of, 803; his system of steeping seeds, 801
Campanula pyramidalis, 102; fragilis, var. hirsuta, 231
Canary, fecundity of, 654
Canker in Auriculas, 22; in fruit trees, 40, 502, 624; origin of, 767
Canton, celebration of new year at, 505
Cape Heaths, select, 72, 120, 508, 575; management of, 392; varieties to flower in winter, 836
Capital for a farm, 14
Cape Iridaceæ, 638
Carbonate of soda, coffee improved by, 559
Carbonate of iron as manure, 675
Carbonated hydrogen gas, effect of on plants, 71
Carnations, colour of, 22; adv., Youell, 1; Slater, 194; pipings of, 53; border varieties, 69; select, 136, 560; composts for, 168; culture of, 300; show of, 507; black spot on leaves of, 836; effect of liquid manure on, 833
Carrots, culture of, 53; land for, 153; guano for, 268; Belgian Green-top, adv., Nutting, 162; to harvest, 771; Belgian, 788
Cart or waggon for harvest purposes, remarks on, 509, 548
Caterpillars, to kill, 120; on Gooseberry bushes, 317, 372, 390, 429, 502, 575, 589, 655
Cattle, rearing of, 29; Ayrshire, deterioration of the breed in Ireland, 660; fattening of, 61, 110; water for, 598; weight of, 282; to feed in

Horses, 433; shed feeding of, 451; yoking of, to ploughs, 658; to harness, 724, 740; cure for distemper in, 693 murrain in, to cure, 174; young, fever in, 219; food for, 153; best spring crops for food for, 657; ditto, Flax-seed as, 594, 610, 626, 692, 708, 754, 789; ditto, Nettles as, 204; Rape as, 878; Pleuro-pneumonia in, remedy for, 556
Cattle-yards, sand a substitute for straw in, 707
Cattleya marginata, 6
Cat, singular propensity of, 405; influence of Valerian on, 573, 588; to kill, law concerning, 570, 638
Cauliflower, Walcheren, adv., Marnock and Manby, 1
Celery, to improve, 152; to prune, 264; of Lebanon, seeds of, to make germinate, 543
Celerine, treatment of, 136; remarks on, 184
Celery, treatment of, 72, 213; to earth up, 640
Cement, 197; marble, adv., Keenes's, 159
Centaurea, monstrosity of, 557
Cerris canadensis, 276
Cerris seedling, noticed, 733
Chalk, to apply to land, 64; its use in improving clay soils, 737, 753; burnt, 158
Chalking land, remarks on, 753, 802
Chandler's nursery, noticed, 231, 783
Channel islands, 529
Charcoal for plants, 8; experiments with, 319; effects of on plants, 69; to make, 184, 720; carbonic acid condensed by, 71; remarks on, 295; ancient, remarks on, 505; and salt, their effect on Turnips, 466; peat, to manufacture, 362; ditto as a top-dressing for land, 467
Chatsworth, gardens at, noticed, 734
Cheese, importations of, 676; Dutch, flavour of, 724
Chelmsford wool fair, 452
Chemistry Association, 307, 469, 489, 724
Chemistry, to apply to agri., 27, 43, 59, 75, 91, 106, 123, 139, 155, 179, 186, 203, 235, 267, 283, 303, 319; of cultivation, 247, 293; and agri., 309; remarks on, 804; agricultural, by J. F. W. Johnson, rev., 470; by G. Cox, rev., 767; by Prof. Low, rev., 103; practical organic, Pickering, rev., 55
Chepstow Farmers' Club, report of, rev., 51
Cherries, kinds for an orchard, 544
Chestnut, fruited, Oak-gall fly, 212
Chicory, culture of, 203, 294, 317; remarks on, 324, 356; to prepare, 360
Chickweed, to destroy, 46
China, news from, 103; Canton, celebration of new year at, 505, Fatee gardens, near Canton, 590; Textile plant from, 151
Chinese agri., 220; seeds, remarks on, 405
Chocolate, 7
Chocolate-tree and its uses, 835
Chrysanthemums, kinds to save seed from, 24; select, 72; guano for, 575; effect of liquid guano on, 765; treatment of, 814
Churn, Sussex, adv., Barnes & Co., 159
Cider, antiquity of in Normandy, 543
Cinerarias, adv., Brewer, 1; culture of, 527; select, 624
Cirencester agri. college, 308, 469
Citron a remedy for poison, 87
Citrus tribe, culture of, 244
Clay land, to crop, 26; burning of, 549; to prepare for Turnips, 77; to drain, 707; management of, 878
Clematis montana, 7
Clianthus puniceus, 688
Climbers, greenhouse, 72, 300; hardy, 120; select, 152; list of, 392, 412
Clitoria fulgens, 463
Clover dodder, 28, 629, 820; remarks on, 625
Clover, Dutch, 70; red, failure of, 529; seeds, to sow, 454
Clubbing in Cabbages, to prevent, 640
Coal, burning of, 51, 99; agri. character of, 691; trade, 153
Coccinella septem punctata, 588
Coccus Vitis, to kill, 24
Coffee improved by carbonate of soda, 559, 835
Colleges, agricultural, 14; at Cirencester, 308, 469
Collier's Wood, Tooting, gardens at, noticed, 247
Colours by candlelight, 524
Commelina cælestis, 56
Compost heaps, to form, 512
Coniferæ, remarks on, 248, 300, 557, 606; to graft, 330; Highland Pine, adv., Grigor, 161; azotised matter injurious to, 484; of Japan, 523, 555; Mexican, 260; hardiness of, 315, 372, 390; growth of, in Morayshire, 683
Concrete tiles, 13
Conservatories, plants for, 340; with fixed roofs, 504; subjects fit for culture in, 829
Co-operation, experimental, 9; between farmers and chemists, 77
Convallaria racemosa, 832
Coppices, to plant, 72; Birch, 813; ditto, to manage, 869; hints on renovating, 811; management of, 833
Coprolites, 10; to apply as a manure, 43, 91
Corethrostylis bracteata, 607
Corn, Indian, 365; to save, in damp weather, 349; steep for, 582; transmutation of, 555, 573, 621, 629, 692, 779; to sow, 595; waste of, in thick sowing, 609; mode of harvesting, in East Lothian, 611; Davies, on the waste of, rev., 609; experiments with, 26
Corn weevil, 12
Cornus florida, 276
Cotswolds, farming on, 756
Coughs, Horehound, a remedy for, 375
Country Shows, 259, 315; remarks on, 403
Couve tronchouda, 120
Covering for greenhouses, 214; for flower-beds, 215; for fruit trees, 358; for frames, 392, 504, 797, 798
Cow-houses, ventilation of, 190
Cow Wheat, 171
Cow Cabbage, 237
Cows, milking properties of, 253; to stall-feed, 304, 364; swollen by Turnip tops, 91; dairy, winter food for, 510, 579; oil-cake as food for, 742; to feed, 875
Cowslips, remarks on, 373
Cox on Agricultural Chemistry, rev., 767
Cream, bitter flavour of, 708
Crocuses, 216
Cropping, course of, 142; old system of, 420
Crops, best sorts of, for spring food, 642, 657; two, per annum, 707, 756; on the same land in successive years, 772; rotation of, 190, 486, 660; value of, 155, 285; state of, 465; appearance of, 545; failure of, 612; in East Lothian, 674; Barley, to secure, 721; galvanism, to apply to, 598; rotation of, in East Lothian, 802; to protect from hares and rabbits, 853
Crustacea, British, by T. Bell, rev., 815
Cryptogamous, plants of Dr. Roxburg, forming part of the "Flora Indica," by W. Griffiths, rev., 318
Cuckoo, remarks on, 298
Cucumbers, to grow, 8, 22; size of, 53; remarks on, 148; soil for, 736; winter culture of, by J. Moor, rev., 198; cause of their exuding gum, 448; ridge, failure in, 505
Cucumber frames, steam in, 85; glasses, bulb water, superiority of, 589
Curculio lineatus, 388
Currant, sporting of, 87
Currant trees as standards, 5, 21; to graft, 390,
Cuttings to send to India, 197; to strike, 392, 699; action of light and moisture on, 715; in charcoal, 450; to prepare, 540; to keep a moist atmosphere for, 590
Cymbidium pendulum, var. brevilabre, 318
Cynips, Quercus castaneæ, 212; Quercus pedunculi, 499
Cypripediums, hardy, 280

D

Dahlias, select, 340; adv., Harrison, 17; Drummond, 17; Keynes, 17; Bushell, 17; Ansell, 33; Spary, 33; Whales, 33; Girling, 63; Oliver, 65; Syred, 81; Daniel, 129; Brown, 129; Jones, 161; Smith, 177; to render hardy, 336
Dairy, management of, 170
Dalvey Gardens, near Forres, noticed, 639
Daniel's manure, 451
Darnel, poisoning by, 279
Dart moths, remarks on, 619
Datura arborea, 136
Davies on the waste of Corn, rev., 609
Davis's system of farming, 804
Davy's Agri.-Chemistry, by J. Shier, rev., 734
Deadly Nightshade, poisonous effects of, 654
De Candolle's Prodromus, 318
Denton's A level, 755
Deodar, to graft, 40; to strike, 104; large plantation of, 318
Derby Arboretum, noticed, 318
Dialogue on Instinct, by Brougham, rev., 782
Dickson, Mr., his Tulips noticed, 298
Dictionary of the Farm, rev., 437
Dilophus febrilis, 868
Disease, functional, 180, 214
Diseases of plants, 35, 99, 131, 148, 227, 587, 636, 683, 715, 764, 796, 851; of Potatoes, 163; of sheep, by W. C. Spooner, rev., 469
Distemper in cattle, cure for, 693
Dogs, distemper in, 348; scent of, for game, 766
Dog-rose, remarks on, 637; fruit of, 669
Doryanthes excelsa, 152
Double white Hepatica, 213
Doxat's Meteorological Ephemeris, rev., 622
Drains, remarks on, 13; depth of, 772; made of peat, 304
Drain-pipes socket, 788
Drain-tiles, cost of, 27; remarks on, 381
Draining, thorough, 45, 517; report on, 710; theoretical views on, 529, 657; effects of, 91; on heavy land, 562, 707; materials for, 108, 171; Deanston system of, 725; tile, remarks on, 724; furrow, 125; application of geology to, 397; at Castle Shane, Monaghan, 693, 725; advantages of, 449; remarks, 612, 644, 675; deep, advantages of, 13
Drainage, 468, 529; material for, 562; for garden pots, 575
Drainage and irrigation, 840
Draught, remarks on, 186, 609, 658
Drilling wide, 452, 628; thin, 862
Drummond's Museum, 466
Dry-rot in timber, 200, 798, 870
Dublin Botanic Garden, noticed, 799
Duke of Cleveland on leases, 13
Dye, new Indian black, 119; new English, 463; vegetable, 505
Dynamometers, remarks on, 380; Cottam's, 593; Clyburn's, 593

E

Earth, instance of its being eaten by a cow, 284
Earth-worm fly, 275
Earthenware-pipes, to joint, 797
Earwigs, to trap, 432, 560
East Lothian Husbandry, 302, 323, 343, 362, 378, 394, 414, 435, 449, 466, 487, 511, 531, 611, 626, 643, 674, 706, 722, 739, 771, 787, 802, 839, 858, 874
Echites crassinoda, 687
Economical Polish beverage, 167
Edgings, Heath for, 102, 133, 166
Edinburgh Botanic Garden, noticed, 871
Education, scientific, 466; agricultural, 27, 30, 49, 301, 341
Elæagnus reflexa, 23; parvifolia, fruit of, 571
Electricity, influence of, on the growth of plants, 741
Elm, deformity in, 277
Elm-roots, effects of frost on, 87
Elm-gall aphis, 37
Emigration, 104
Engine-houses for plants, 101; plants for, 184
England, southern and western, journey through, 594
English Larch and Scotch Pine, 61
Entomology—*See* Insects
Entry, valuations on, 265
Epacris autumnalis, 703
Epidendrum radiatum, 607
Eranthemum pulchellum, 247
Eria floribunda, 298
Erica Murrayana, 318
Eriosoma bursaria, 164
Essay on Flax, by J. Sproule, rev., 222
Eucalypti, at Northwood Park, 199
Eucharidium grandiflorum, adv., May, 129
Euonymus japonicus, 86
Euphorbia Jacquiniflora, 405
Evergreens, 8
Ewes and lambs, 77
Excrescences on timber, 22
Excrescences in Oak, 166
Experiments with corn, 26; with Potatoes, 138; with manures, 154, 217, 283, 293, 347; in Hort. Soc.'s Garden, 227, 259

F

Facts, registration of, 639
Falcon, Peregrine, 813
Fallowing, remarks, on, 643
Familiar Botany, 68, 84, 100, 117, 133, 148, 165, 195, 180, 211, 229, 260, 294, 404, 501
Farmer, by G. Nicholls, rev., 309
Farm-horses, to keep, 89, 105, 169; fences, 305; ditto mode of making, 380, 660; book-keeping, 787; stock, cheapest means of wintering, 613; bailiffs, 201, 305; implements, economical, value of, 593, 612; ditto draught of, 609; yard manure, 451; ditto experiment with, 773; ditto treatment of, 818, 859; labourers, boys to employ as, 630; servants in East Lothian, 858
Farms, Advice on the Management of, rev., 93; experimental, 90; small, management of, 380; in Monmouthshire, report on, 821

Farmers' Clubs—*See* Societies.
Farming, remarks, on, 25; a few notes on, 788; for Ladies, rev., 453; Scotch, 740; profits of, 73; woes of, 628; and gardening, 101; good, 326; Scotch and English, 722; on the Cotswolds, 803; the No-pasture system of, 875; Davis's system of, 804; science of, 344
Fastolff Raspberry, 117, 148, 669 703
Fatee Gardens, near Canton, 590
Favourites of the Flower-Garden, by G. Francis, rev., 590
Fences, 305; destruction of, 820; mode of making, 380, 660
Fence for trees, 660
Fence, Macclesfield, Gardens at, noticed, 30
Ferns, fossil, 72; to remove, 88; hybrid, 500
Fertilisers of Commerce, 218; by C. W. Johnson, rev., 246
Festuca elatior, 236
Fever in young cattle, 219
Fever-fly, 868
Figs, to cultivate, 5; culture of, 54, 261, 640; barrenness in, 147; remarks on, 184, 200; management of, 228; tree, dwarfed, 503; to manure, 688
Filberts, management of, 856
Fire-flies, to naturalise, 262
Fire-clay as manure, 692, 756
Fish-ponds, tree-leaves injurious to, 797
Flax, cultivation of, 44, 124, 137, 218, 233, 251, 267, 303, 322, 342, 379; fields, weeds in, 89; as food, 594, 610; seed as food, 626, 692, 708, 754, 789; Essay on, by J. Sproule, rev., 222
Fly in sheep, to prevent, 756
Florists' flowers, intended shows of, 815
Florist's reformer, 572; flowers, Dr. Lindley's opinion on, 603; Journal, No. 63, rev., 783
Flowers, guano a preservative of, 358
Flower-borders, baskets round, 834
Flower-gardens, bedded out plants in, 525; appearances of, 556, 605; to decorate, 637, 766; plants for, 656; modern, 869
Flower-beds, baskets round, 853
Flower seeds, adv., Hurst and M'Mullen, 130; adv., Warner and Warner, 146; Cooper, 194
Fodder for horses, 285, 419
Food for cattle, 153; Gorse as, for horses, 75, 90, 139, 188, 203, 204; Horse-chesnuts as, for sheep, 365; best spring crops for, 657; Flax-seed as, 594, 610, 626, 692, 708, 754, 789, 820; Acorns as, for pigs, 699, 772; Rape for, 878
Foot-rot in sheep, 204; remarks on, 806
Forest-trees for a chalky soil, 40; to prune, 54, 101, 117, 150, 214, 461, 502, 620, 651, 699, 716, 732, 749, 763, 765, 781, 795, 833, 870; for a bleak situation, 816; management of, at Nerquis, 651, 701, 717, 763, 781; to transplant, 503, 734, 781; growth of, 541; M. Chevaudier's experiments with, 539; quick growing kinds, 544; judicious pruning of, 749; select, 285
Forcing, unseasonable, remarks on, 571
Forks, Dr. Yelloly's, 787
Forget-me-not, 229
Fortune (Mr.), news from, 103, 318, 655, 799
Fossil Ferns, 72
Fountains, 216; remarks on, 797
Fourcroya gigantea, 540, 655
Frames, covering for, 797, 798; for Cucumbers, 798; to clear of insects, 869
Freckles remedy for, 560
Frith of Tay, inclosures from, 837
Frost in Dec., depth to which it penetrated the soil, 853
Frost, effect of on Elm roots, 87; on glass, 854
Froth-fly, remarks on, 405
Fruits cultivated in Madeira, 736; Syrian, 263; to gather, 637; to preserve, 460, 524, 587, 604
Fruit-trees, to dig among, 5; to render independent of the stock, 39; select, 72; adv., Rivers, 50; Forrest, 81; canker in, 40, 502, 624, 767; pruning of, 779; summer pruning of, 502, 563; to root prune, 120; wash for, 181; salt as manure for, 685; Lichens on, 56, 248; to pack for New Zealand, 573; kinds for espaliers, 752; sorts not liable to canker, 768; to plant, 797; list of good sorts, 816; remarks on root-pruning, 816
Fruit-tree borders, to crop, 832
Fuchsia seed, to sow, 24, 360; adv., Miller, 28
Fuchsias, select, 120, 168, 200, 432, 624; adv., Epps, 97; Youell, 98; Hancock & Son, 98; Pawley, 161; Rogers, 162; Girling, 177; Smith, 177; Mr. Wood's remarks on, 163, 179, 195, 212, 227, 243, 315, 355; soil for, 232; hardy, 277; to graft, 295; to hybridise, 592, 654; to keep over winter, 765, 797
Fullers' earth, agricultural character of, 577; effect of on crops, 772
Functional disease, 180, 214, 246
Furnace, Williams's improved, 179

G

Galls, remarks on, 764
Galvanism, to apply to crops, 598
Game laws respecting rabbits, 245, 264, 518, 582, 595
Gardeners, advantage of a knowledge of vegetable physiology to, 832; at Chiswick, Exhibition, 358
Gardeners' Almanack for 1845, by G. W. Johnson, rev., 834
Gardeners' Benevolent Institution, 35, 38, Show for, 391; objections to, 798; cost of dinner for, 814, 832
Garden varnishes, 166
Garden-mite described, 316
Garden-pots, drainage for, 575; adv., Marshall, 154; Hunt, 223; advantage of using slate for, 795
Garden-walls, position of, 412
Garden-net, adv., Richardson, 15; Edgington, 95; Hulme, 95
Garden-syringe, adv., Read's, 34
Garden-pumps, adv., Fowler, 47
Garden poet, 375
Gardening, antiquities of, 668; in Italy, 733
Gas-lime, 30
Gas-tar, a guard for trees, 101
Gas-water, 305; to apply as manure, 875
Gastrolobium spinosum, 654
Gaylussacia pseudo vaccinium, 834
Genista virgata, 151
Gentianella, to sow the seed of, 592
Gentiana verna, 317
Geological Society, Rev. Mr. Ansted appointed librarian to, 855
Geology, &c. by D. T. Ansted, rev., 215, 870; and agriculture, 234, 249, 266; to apply to draining, 397; application of to agriculture, &c., by N. Whitley, rev., 141
Gerardia quercifolia, 831; flava, 831
Gesnera Douglasii, 8; zebrina, treatment of, 752
Gladioli, to plant, 768; remarks on, 119, 133; to raise from seed, 200
Gladiolus gandavensis, 231; adv., Corsten, 194
Glass, advantage of using sheet, 856
Glass milk-pans, 269
Glazing, new mode of, 277, 389
Glendinning's nursery noticed, 527
Glimpses of Nature, by Mrs. Loudon, rev., 118
Gold of pleasure, 70
Glout Morceau, meaning of the word Glout, 765
Gloucestershire, geo-agricultural notes on, 485, 509, 561, 577, 593, 627, 644, 690, 721, 754
Gluten in grain, 78, 92
Glow-worm, 443
Gloxinias, in a greenhouse, 56; remarks on, 229; speciosa, &c., 591
Glycine sinensis, 558
Goats trespassing, law of, 720
Gold fish, spawning of, 136; remarks on, 213
Golden Pippin, 390, 749; decay of 797, 813
Gompholobium Hendersonii, 447
Gooseberries, select, 152; weight of, 541; good kinds, 168; large size of, 524; list of, 784; seeds to sow, 320; heaviest exhibited between 1817 and 1844, 811; to preserve from birds, 854
Gooseberry-caterpillars, 317, 372, 390, 429, 502, 575, 589, 655
Gorse, as food for horses, 75, 90; remarks on, 139, 188, 203, 204; chopping-block for, 156
Gourds, weight of, 166
Gower on the scientific phenomena of domestic life, rev., 506
Grafting, 181; so as to accelerate bearing, 431; Marder's composition for, adv., 95; remarks on, 448
Grain, gluten in, 78, 92; sold by weight, 158; crops, to harvest, 577; proper time to harvest, 595
Gramina Britannica, by J. L. Knapp, rev., 574
Grant's beehive, 333
Grape, Oak-gall, 499
Grapes, Wilmot's Black Hamburgh, 749, 798, 813; cause of shanking in, 575, 749, 813, 833; to mature, 86; monstrous, 655, 701; new variety of, 655; culture of, in pots, 195, 212 228
Grasses, works on, 136
Grass, killed by pork brine, 724
Grass-land, to manure, 46, 91; to break up, 741, 875; remarks on, 324
Grass-seeds, 62, 174, 200; for cover, 78; for lawns, 120, 280; for sowing under trees, 392, 412; by J. Sutton, rev., 167; adv., Warner and Warner, 130; Sutton and Sons, 130; to sow, 190, 566; depth of cover for, 706
Gravel walks, to form, 504; to kill Moss on, 503
Grave-digging sand-wasp, 731
Gray (Mr.), his garden noticed, 607
Grey Wagtail, 557, 767
Green-fly—*See* Aphis
Greenhouse-plants, list of, 88, 432, 688
Greenhouse, covering for, 214; climbers for 72, 300
Green crops, value of, 155
Grenier mobile, or revolving granary, described, 767
Grey Parrot, 573; treatment of, 580, 604, 621
Green Teas of commerce, 507
Groom's Nursery, noticed, 298, 390
Growth of Plants, by J. Munter, rev., 134
Guano, situation of, 30; for flowering plants, 23; to apply, 62; adv., Gibbs and Son, 15; Boyde, 47; Fothergill, 47; Dr. Von Martius on, 106; Report on, 122, 138; African, 183, 236; ditto, sale of, 512; analysis of, 518, 579; effect of, on Wheat, 629; for Onions, 120; from Africa, 142; for Turnips, 174; to mix with water, 168; to kill worms, 166; remarks on, 204, 252, 284, 396, 629; British, 204; to preserve, 188; its nature, &c., rev., 237; history of, 269, 787; to apply, 268; from Ichaboe, 263, 494; experiments with, 324; and ashes, 325; a preservative of flowers, 358; wire-worms killed by, 364; on the coast of Peru, 411; constituents of, 94; islands from whence it is taken, 607; contract for, 109; Report on, 106; a hundred years ago, 492; Potter's adv., 15; ditto, remarks on, 606, 629; analysis of, 645; quantity of, to apply, 672; natural and artificial, 489; egg found among, 572; sale of, at Liverpool, 582; Instructions for using, by J. Clark, rev., 677; Ichaboe, analysis of, 708; Teschemacher's experiments with, on the growth of plants, 719; to fix the ammonia in, 756; how to apply, 758; adulteration of, 485, 774; what it is, 772; liquid, effects of on Chrysanthemums, 575, 765; good, how to know, 789; volatile matter of, imbibed by salt, 788; artificial, 437; for Carrots, 268; Potter's, its effect on plants, 797; value of

862; liquid, to make, 852; *versus* farm-yard dung, 875
Gunnersbury, Cucumber growing at, 559
Gurneyism, remarks on, 862
Gynerium argenteum, 734
Gypsum, as manure, 435, 858; remarks on, by Professor Henslow, 691; for fixing ammonia, 722, 742, 860; in guano, 756

Pipe-tile machine, description of, 460
Pits described, 102; forcing, for amateurs, 732; sunken, remarks on, 448; for Pines, 132, 180
Plantations, remarks on, 365; in Aberdeenshire, 876; in North Wales, 4, 21
Plants, acquired habits of, 5; constitutions of, 21; culture of, in pots, 83; cause of hardiness of, 85, 100, 116; diseases of, 99, 131, 148, 227, 587, 636, 683, 715, 764, 796, 851; Mr. Linden's, 855; for hybridising, 870; half hardy, spring management of, 100; ditto, winter treatment of, 540; time for repotting, 102; qualities of, 117; influence of the moon on, 502; to acclimatise, 502, 524; for a border, 72; for bedding out, 40, 541, 544; effect of carburetted hydrogen gas on, 74; roots of, 30, 62; succulent, remarks on, 603; that produce wax, 151; absorbent parts of, 147; propagation of, 183; ditto, Agricola's notions of, 683; season for shifting, 214; agricultural, composition of, 249; tables showing the constituents of, 250; list of, for forcing, 264; out-door, to water, 277; in charcoal, management of, 319; herbaceous, list of, 624, 784; adv., Jackson & Co., 113; in beds, to water, 556; pollen of, new discoveries concerning, 628; monstrosities in, 637; for a flower-garden, 656; for a rockwork, 672; aquatic, 300, 672; for a greenhouse, 88, 432, 688; ditto climbers for, 72, 300; for a stove, 688, 720; for a conservatory, 340; ditto, subjects fit for culture in, 829; remarks on striking cuttings of, 699; action of light and moisture on cuttings of, 715; inorganic constituents of, 250, 723; influence of electricity on growth of, 741; to pack for long voyages, 815; engine-houses for, 101; ditto, plants for, 184; artificial fertilisation of, 215; charcoal for, 8; experiments with ditto on, 319; ditto, effect of on, 69; climbers, 120, 152, 392, 412; Teschemacher's experiments with guano on growth of, 719, effect of Potter's guano on, 797; paper for drying, 373
Plant brokers, 502
Playfair, (Dr.), his lectures at the Royal Institution, 840
Pleuro-Pneumonia in cattle, remedy for, 556
Ploughs, swing and wheel, remarks on, 578; subsoil, different sorts of, 689; ditto, 641; yoking of cattle to, 658; construction of, 738; how to improve, 786; form of, 802; remarks on different forms of, 817; remarks on, 838
Ploughing, loss of time in, 286; subsoil, 254, 681; utility of, 644
Plums, Myrobalan, 216; kinds for an orchard, 544
Poison, Citron a remedy for, 87
Poisoning by Darnel, 279
Police and Constabulary List, noticed, 693
Politics, non-interference with, 859
Pollen, vitality of, 245
Polmaise heating, 606; remarks on, 653, 669, 717, 732
Polyanthus, remarks on, 35, 70, 115; treatment of, 149; list of, 572; select, 136, 200; a good bee-flower, 245
Pomegranates, treatment of, 640
Pond water, 234
Poor rates, law of, 184
Poplar, gall aphis, 164
Pork-brine, grass killed by, 724
Potatoes, 152, 267; to plant, 24; Ash-leaved Kidney, 79; ditto, origin of, 462; curl in, 69, 237, 267, 305; disease of, 163; failure of, 102, 251, 596, 612, 628, 645, 662, 668, 691, 692, 723; ditto, to prevent, 158; experiments with, 138; planted whole, 140; in pits, 166; manures for, 236; rot in, 234, 310, 359; culture of, 233, 358, 403, 416, 436, 668, 772; origin of, 523; remarks on, 246, 324, 344, 379; to preserve, 305; tuberous excrescences on the stem of, 637; to mould up, 293; on new soil, 629; split by a reed, 708; advantage of pulling the flowers off, 427, 461, 492; to store, 672; Sodon's Early Oxford, adv., Hurst, &c., 177; sorts for seed, 488; mode of storing, 651; accounts of experiments on requested, 731; large, 735; culture of in East Lothian, 797; sorts for pigs, 790; productiveness of, 723; Mr. Grey's experiments with, 801; ditto, remarks on, 795; to sow the seed of, 806; weight of, 804; advantage of autumn planting, 811; depth at which they are secure from frost, 813; to raise from seed, 839; effect of picking the blossoms off, 851; of pinching off the ends of the shoots, 851; to plant in autumn, 852; difference between the produce of whole and cut sets, 867; experiment with sorts imported from different countries, 876; effect of autumn planting, 869; remarks on, 876
Potato-ashes, analysis of, 559
Potato-starch, 435
Pot pourri, recipe for making, 508
Potiron Jaune, size of, 166
Potting, 296; Mr. Wood's remarks on the one-shift system of, 20, 83, 100, 116, 163, 179, 195, 212, 227, 243, 315, 355
Potter's liquid guano, effect of on Asparagus, 261, 406, 430, 656
Poultry, diseases of, 364
Practical Organic Chemistry, Pickering, rev., 55
Prickly Comfrey, 286, 364
Principles, knowledge of essential to good cultivation—*See* Potting
Preserves, to cork, 524; recipe for refreshing, 701
Productive Farming, by J. A. Smith, rev., 45
Propagating glass, new kind of, 589
Prunus cerasifera, 214
Pseudo-acacia, 21; durability of, 37

Q

Quack Manures, 676
Qualities of plants, 117
Quercus sessiliflora, 53
Quince, Chinese, 752
Quisqualis sinensis, 215

R

Rabbits, to kill, 245, 261, 284, 317, 358, 417, 870; game laws respecting, 245, 261, 518, 582, 595; cost of keeping, 723; crops to protect from, 853
Railroads, effect of, 756
Ranunculuses, select, 115; remarks on, 404; culture of, 687; adv., Tyso & Son, 33; Eyre, 49; Sutton & Son, 111
Rape, culture of, 534; for winter feeding, 878
Rape-dust as manure, 435
Raspberry, analysis of, 133; Franconia, 103; Fastolff, 117, 148, 669, 703; adv., Willmer, 193; Youell, 194; to train, 461; Bee-hive, 701, 717
Rats, 70; to kill, 140, 245, 277, 335, 389, 870; phosphorus as a poison for, 489, 504; singular habits of, 359; recipe for killing, 416
Rawstone (Mr.), his Lancashire Farming, rev., 29
Recipe for wounds, 93
Red spider, to kill, 640, 765
Regent's Park Exhibition, judges at, 459
Rent day, 534
Rent, law of payment of, 40
Rennie on Bird-Architecture, rev., 670
Report of Dr. Von Martius on Guano, 106, 122, 138; of the Yorkshire Agric. Soc., rev., 173; of the Royal Agric. Soc. of England, 172; of Farms judged by the Yorkshire Agric. Soc., rev., 189; on the Lunatic Asylum of Derby, by W. W. Pike, rev., 269
Rhozomorpha medullaris, 38
Rhododendrons, &c., to force, 24, 784; list of, 88; to raise from seeds, 340; select, 464; campanulatum, 749; hybrid, 317
Ribstone Pippin, 832; diagram of the original tree, 812
Rhubarb, Tobolsk, adv., Youell, 1
Robin, 293, 335; and hedgesparrow, 605; history of, 620; jealousy and ferocity of, 782
Robinia Uterhartii, 199
Rock plants, list of, 152, 672
Rocket, double, culture of, 575
Rollisson's Nursery noticed, 231
Rooks, injury done by, 60; insects killed by, 107, 417, 451; remarks on, 171, 204, 321, 355, 364, 437, 503, 563, 660; service of, 839
Roots, action of, 502; effect of deep burying, 523, 558
Root-pruning fruit-trees, 120
Root excretions, 357, 390
Root crops, to preserve, 107; to harvest, 705, 737; on heavy lands, 454
Roses, to prune, 8, 136; select, 88; culture of in France, 316; stocks for, 101; remarks on, 200, 280; March pruning of, 444; budding of, 404, 620; grafting of, 684, 732; body budding of, 372; to raise from seed, 371; to propagate, 387; Bourbon, to strike, 335; method of labelling, 372, 429; buds, to guard against winds, 460; to prune for transplanting, 523; to replant with a dormant bud, 523; prize sorts, 559; annual pruning of, 571; shape of trees, 604; in pots, 603; to plant out, 619; autumnal trip to Paris in search of, 700; yellow Noisette, treatment of, 704; list of, 736, 831; hardy, list of, 768; list of, for a cottage garden, 816; remarks on grafting, 811; China, list of, 448, 852; mode of training, 853; standard, culture of, 405
Rose Catalogues noticed, 669; remarks on nurserymen's, 684, 701; Wood's, rev., 622; Francis's, rev., 719; Rivers's, rev., 703
Rosa canina, 637, 669; sulphurea, to flower, 358
Rose Garden, 36, 52, 67, 84, 101, 116, 165, 317, 332, 356, 372, 388, 444, 460, 523, 571, 604, 619, 684, 732, 831, 852, 869; operations in, in different months, 811
Rot in Larch, 4; in sheep, 268, 323, 380, 416; in the Potato, 359
Rowland (Mr.), his garden noticed, 391
Royal Institution, Mr. Solly's lecture at, 262; remarks on, 347; Dr. Playfair's lectures at, 840
Ructon-hall noticed, 279
Ruellia sabiniana, 8
Rye as a spring crop, 642; Rye-grass as, 657

S

Sacchiphantes abietis, 831
Salt, decomposition of, 60; Thistles killed by, 91; as manure, 185, 201, 524, 708, 756; to fix ammonia, 187; for Asparagus, 317, 429, 444, 589, 621, 685; its effects on Turnips, 466; action of, on carbonate of lime, 628; Gooseberry caterpillar killed by, 655; as manure for fruit-trees, 685; a preventive of slugs, 740
Salvia splendens, to flower, 5
Salvia prunelloides, 799; strictiflora, 871
Sand a substitute for straw in cattle-yards, 707
Sand hills, to plant, 724
Sandstone, red, agri. character of, 644, 754
Sap in trees, circulation of, 387, 816
Sarcophaga carnaria, 275
Saw-dust as manure, 62, 152; remarks on, 172

GARDENERS' BENEVOLENT INSTITUTION.

—A General Meeting of the Subscribers to this Charity will be held at the CROWN AND ANCHOR TAVERN, Strand, on THURSDAY, 11th January next, for the purpose of receiving the Accounts of the past year, and electing Officers for the ensuing year. Also for the purpose of electing two poor persons of 60 years of age and upwards on the Pension of this Charity. The Chair will be taken at 12 o'clock precisely. The Ballot will commence at 1 o'clock, and close at 3 o'clock.

The Subscribers and friends to the Charity will afterwards celebrate their Annual Festival at the CROWN AND ANCHOR TAVERN.

JOHN NOBLE, Esq., in the Chair.

Stewards.

WILLIAM FLANAGAN, Esq.
FINLAY FRASER, Esq.
JOHN HENDERSON, Esq.
JOHN LEE, Esq.
PROFESSOR LINDLEY.
HUGH LOW, Esq.
JOHN NOBLE, Esq.
GEORGE WARDE NORMAN, Esq.
CHARLES PALMER, Esq.
ALEXANDER PROTHEROE, Esq.

JOHN WRENCH.

Dinner on table at a quarter past 5 o'clock. Tickets 15*s.* each, to be had of the Stewards, at the Tavern, and Mr. E. R. CUTLER, Secretary, 97, Farringdon-street.

E. R. CUTLER, Secretary.

FLORICULTURAL SOCIETY OF LONDON.—

The GENERAL ANNUAL MEETING for the election of a Committee and Officers for the year 1844, and for the consideration of other matters connected with the above Society, will take place at 2 o'clock on THURSDAY, the 11th instant, at the Crown and Anchor Tavern, Strand. T. C. WILDMAN, *Hon. Sec.*

IPSWICH CUCUMBER SOCIETY.—Open to all England.

PRESIDENT.

The Right Hon. Lord Rendlesham, M.P., Rendlesham Hall.

VICE-PRESIDENTS.

Capt. Aplin, Melton Lodge.
Wm. Rodwell, Esq., Ipswich.
Rev. C. Green, Sibton.
Dr. Maclean, Colchester.
Peter B. Long, Esq., Ipswich.
Dr. Beck, Ipswich.
W. J. Maude, Esq., Langham Hall
Wm. Green, Esq., Boxford.
P. S. Edwards, Esq., Greenock, Scotland.

The Cucumber growers of England are respectfully informed that a Sweepstakes of 1*l.* each, and a Silver Cup, will be awarded to the best brace of Cucumbers, at the first Show, on Thursday, February 8, 1844, providing the winner is a subscriber to both. Six other Prizes are offered.—Circulars and further particulars may be had on application at 3, Tavern-street, Ipswich.

THOMAS WILD, Hon. Sec.

M'NAB TESTIMONIAL. — The Committee for

Promoting this Tribute of Respect to the distinguished, Curator of the Edinburgh Royal Botanic Gardens, beg to state that in consequence of representations from several quarters, they have extended the time for receiving Additional Subscriptions to the 1st of February, by which date they hope that all who wish to join in this object will have communicated their intention to the Treasurer, Mr. WM. BRAND, W.S., 4, Queen-street, as, from the number of contributors and amount already received, it is improbable that any further delay will take place; and the Committee would much regret if any friends were overlooked, or should be too late to have their names inserted in the list as finally arranged for publication. Edinburgh, 28th Dec., 1843.

NEW HARDY ANNUAL.

VISCARIA OCULATA—DARK-EYED VISCARIA.

T. AND J. BACKHOUSE, NURSERY AND SEEDSMEN, York,

have the pleasure of offering to the Public the above new and beautiful Annual, which is figured at page 53, (No. 10), of the "Botanical Register," for 1843. The blossoms are of a bright rose colour, with a deep crimson eye, and changing to a pale purple. It flowers very abundantly through the greater part of the summer and autumn. It is a native of Algiers, and may be sown either in the open ground in spring, or raised in pots and planted out.

Packets, 2*s.* 6*d.* each, will be sent, on the receipt of a Post office Order, postage free, to any part of the Kingdom.

SPLENDID NEW SEEDLING CINERARIAS.—

Fine early-flowering strong plants of CINERARIAS, saved from the very choicest sorts of blue and crimson colours, selected from between five and six thousand Seedlings of last year. Those purchasing will have an opportunity of flowering some of the choicest sorts in cultivation, remarkably healthy, and having a large stock they can be sold at 9*s.* and 12*s.* per dozen, carefully packed for any part of the country. Applications including Post-office orders will be immediately executed. Large bunches of RUSSIAN VIOLETS in full flower, fit for potting, 6*s.* and 9*s.* per doz.—Direct to MICHAEL BREWER, Sen., Cambridge Nursery.

FASTOLFF RASPBERRY.

YOUELL AND CO. have much pleasure in announc-

ing they have now ready for sending to any part of the United Kingdom, fine Canes of the above highly valuable and much-esteemed RASPBERRY, unequalled for the extraordinary size of its fruit and richness of flavour.

IT IS PATRONISED BY HER MOST GRACIOUS MAJESTY THE QUEEN, HIS GRACE THE DUKE OF RUTLAND, THE EARL OF HARRINGTON, THE EARL OF LIVERPOOL, THE LORD BISHOP OF LONDON, LORD VISCOUNT LORTON, LORD SONDES, &c. &c., as well as by the HORTICULTURAL SOCIETY OF LONDON.

For further particulars they beg to refer to their Advertisement of the 9th ult.: Prices as follows:—

Packages containing	100 Canes	2*l.*	5*s.* 0*d.*
,, ,,	50 ,,	1	5 0
,, ,,	25 ,,	0	14 0

Package included. The usual discount to the Trade, when not less than 200 are ordered.

*** CAUTION.—Y. and Co. beg to call the attention of their Friends and the Public in general to the fact that they have appointed no Agents in London for the sale of the above, and cannot be held responsible for its being genuine, unless purchased direct from their Nursery.

YOUELL'S TOBOLSK RHUBARB, 12*s.* per dozen.

—For particulars of which see their Advertisement of the 18th November.

TWO NEW SEEDLING PICOTEES.—"LADY

ALICE PEEL," 10*s.* 6*d.*, and "MRS. BENYON," 10*s.* 6*d.* per pair.—These two splendid Picotees were raised by the Rev. J. Burroughes, of Lingwood Lodge, Norfolk, and kindly presented by that gentleman to Messrs. YOUELL and Co., for Particulars of which, see their Advertisement in this Paper of the 16th of Sept.

FINEST CARNATIONS AND PICOTEES.

YOUELL AND CO. beg to refer the readers of the *Gardeners' Chronicle* to their Extensive List, with Prices, of the above highly-esteemed Flowers, which appeared on the Advertising pages, 706 and 707, of this Paper, of October the 14th, and will be found to contain every variety worthy of cultivation.

Prices as follows:—	*£*	*s.*	*d.*
12 pair of good Show Sorts	1	4	0
12 ditto fine ditto	1	10	0
25 ditto ditto	3	0	0
12 ditto extra fine and very superior ditto	2	10	0
25 ditto ditto ditto	5	0	0

The selection being left to YOUELL and Co.

FUCHSIAS.

1 dozen of the newest and very best sorts	21*s.*
1 dozen fine do.	12*s.*
1 dozen good show varieties	8*s.*

Sent by post, free, to any part of the United Kingdom.

ARAUCARIA IMBRICATA.

YOUELL AND CO., possessing the most extensive stock in the country of the above Splendid Hardy Ornamental Tree, beg to offer them on the following advantageous terms:—Fine robust 4-year-old plants, 8 to 9 inches high, 10*l.* per 100, or 30*s.* per dozen.—Great Yarmouth Nursery, Jan. 4, 1844.

THE WALCHEREN CAULIFLOWER.

MESSRS. MARNOCK AND MANLEY beg to offer

the above valuable article, warranted genuine, at 4*s.* per ounce; sent by post or otherwise; with a Treatise on its management, so that it may be kept in succession, fit for Table, throughout the year. It produces beautiful, large, compact, Lily-white heads, of a most delicious flavour, perfectly hardy, requiring no hand-glasses; it not only produces a better quality, but a much larger quantity, on the same space of ground as the old kinds of Cauliflower. It will be quite indispensable both to large and small gardens, for no Gardener, after having once had it *true*, would wish to be without it. All kinds of Kitchen-Garden, Lawn Grass, choice Imported and other Flower-seeds, warranted to grow freely, and genuine.

N.B. Their Catalogues of Flower-seeds, comprising everything that is new and rare, are ready, and may be had on application.

Nursery, Hackney, Jan. 4, 1844.

TO GENTLEMEN PLANTING.

J. AND J. FAIRBAIRN are induced from the uncer-

tainty upon which they hold the Manor-street Nursery (situated contiguous to the Home Nursery, Clapham Rise, where attention will be given to all applications), to effect a Sale of the Stock at as early a period as possible, consequently beg to solicit the attention of Gentlemen and the trade to the large and remarkably healthy and well-grown stock, consisting of fine large Laurels, twice transplanted, of extra growth; Portugal Laurels, very handsome; Green Hollies, of various sizes; Evergreen Privets, fine Standard and Dwarf Roses in great variety, fine standard flowering Thorns, Almonds, Æsculus, Robinias, and other Ornamental Trees, and Evergreen and flowering Shrubs, with a large stock of fine standard and dwarf, trained and untrained Peaches, Nectarines, Apples, Pears, Plums, and Cherries, of the most approved kinds, and of growth rarely equalled; also, a large assortment of Forest Trees, consisting of Limes, Elms, Birch, Beech, Hornbeam, Spanish and Horse Chesnuts, Mountain Ash, Poplars, and Spruce, and Scotch Firs; also a large number of Gooseberries and Currants, of excellent growth, and of the best varieties in cultivation, to all of which J. & J. F. respectfully invite the inspection of Gentlemen and Nurserymen, flattering themselves that the general character of the Stock is such as to ensure unqualified satisfaction, and which they are disposed to offer at very moderate prices for cash.

J. & J. F. respectfully beg to call the attention of Gentlemen to their advertisement of Heaths, &c., which has lately appeared in the *Gardeners' Chronicle*. (Oct. 21 and 28.)

Nurseries, Clapham, near London, Jan. 5, 1844.

ITALIAN TUBEROSE ROOTS, 3*s.* per dozen.—

R. HALL begs to advise the arrival of his annual importation of the above-named Bulbs, which are this year remarkably fine At his old Italian Warehouse, 63, South Audley-street, Grosvenor-square, facing the Chapel. Maraschino Curaçao Milk Punch, Old Pale Brandy, &c, &c., of which lists of prices my be had, postage free.

HYACINTHS AND GROWING STOCK.

HUMPHREYS' COMPOUND, applicable to all

Greenhouse Plants, to Hyacinths and other Bulbs, and to promote the germination of Seeds. Sold in bottles 1*s.* 9*d.* each, by FLANAGAN & SON, Mansion-house-street; WARNER & WARNER, 28, Cornhill; HURST & MCMULLEN, Leadenhall-street; W. CLARK, Bishopsgate-Within; SMITH, Islington Nursery; GRIMLEY and Co., Covent Garden; BATT and RUTLEY, 412, Strand; WILLIAM and JOHN NOBLE, Fleet-street; SMITH, Covent-garden; CHARLWOOD, Tavistock-row; W. J. NUTTING, 46, Cheapside; G. LAWRENCE, 18, Piccadilly; JOHN KERNAN, Great Russell-street, Covent Garden; LOCKHART, 156, Cheapside; SHUTTLEWORTH, Pantheon; MINIER, ADAMS, and NASH, 63, Strand; THATCHER and SON, Islington; THOMAS WATKINSON, Market-place, Manchester; W. E. RENDLE, Plymouth; DICKSON & Co., Edinburgh; PONTEY, Leeds; FISHER, HOLMES, and Co., Sheffield; P. LAWSON and SON, Edinburgh; and other leading SEEDSMEN in town and country. Wholesale Agents, DAVY, MACKMURDO, and Co. 100, Upper-Thames-st., London.

RANUNCULUSES, ANEMONES, CARNATIONS, AURICULAS and LILIUM LANCIFOLIUM.

H. GROOM, Clapham-rise, near London (removed

from Walworth) by Appointment FLORIST TO HER MAJESTY, begs to remind the Nobility, Gentry, and Amateurs, that this is the best season for obtaining Collections of the above Flowers, and that in consequence of the success he has had in their cultivation this year, he can offer them at the following moderate prices:—

	£	*s.*	*d.*
100 Ranunculuses, in 100 superb sorts, with names	4	4	0
100 Do. in 100 very fine sorts, do.	2	10	0

Lilium lancifolium album, good bulbs, each	0	3	6
,, ,, ,, large bulbs, each	0	10	6
,, ,, punctatum, good bulbs, each	0	7	6
,, ,, ,, large bulbs, each	1	1	0

Catalogues may be had on application.—Jan 5, 1844.

SEEDS, NEW AND TRUE.

MESSRS. SUTTON AND SONS respectfully acquaint

those readers of the *Gardeners' Chronicle* who have not yet hitherto honoured them with their commands, that their grounds being situated at considerable distances from each other, and of different soils, they are enabled by strict attention to grow GARDEN SEEDS true to their kinds, and supply Seeds which they know to be new, thereby preventing disappointment in the crops. A great saving of expense will also be effected, and the most improved sorts insured by purchasing either of the undernamed collections, which are selected according to Messrs. SUTTON's actual knowledge of the comparative merits of each kind.

	£	*s.*	*d.*
No. 1.—*A complete Collection of new Kitchen-garden Seeds, of very best kinds, being one year's supply for a first-rate establishment*	3	3	0
No. 2.—*A Collection containing all the kinds as the above, but in smaller quantities*	2	2	0
No. 3.—*A Complete Collection, in quantities suitable for smaller Families*	1	1	0
No. 4.—100 *Ranunculuses, in* 50 *fine varieties, by name*	1	5	0
50 *ditto in* 50 *ditto ditto*	0	15	0

N.B.—Parcels delivered free of carriage to London, or to any part of the Great Western Railway within 60 miles of London.

For Gardeners and others who would prefer selecting the sorts of seeds themselves, S. & SONS have just published their annual Catalogue of new Kitchen-garden and Flower Seeds, which will be forwarded immediately, post-paid.

*** Where a reference is given payment need not be made for twelve months, which will afford ample opportunity for proving the excellence of the Seeds.—Reading Nursery, Berks, Dec. 21.

TO NOBLEMEN and GENTLEMEN who are PLANTING and IMPROVING THEIR ESTATES, and to NURSERYMEN.

RICHARD MITTON, NURSERYMAN, Pontefract,

Yorkshire, has now growing in his Nurseries (which lay very high and bleak, and from which plants generally thrive) to be disposed of at *reduced prices* a large stock of Healthy, Well-rooted, and Transplanted Forest Trees, of all sorts and sizes; especially Larches, 2 to 3 and 3 to 4 feet high: Evergreen and Flowering Shrubs, Fruit Trees of all the choicest Sorts, and Ornamental Trees of every description. Prices on application may be had of goods delivered free at those prices at any Railway Station or Canal Warehouse north of Derby or south of Newcastle-on-Tyne.—Pontefract, Dec. 20, 1843.

SHILLING'S EARLY GROTTO PEA.

J. AND S. SHILLING have succeeded in raising the

above PEA, the Early Frame Pea, impregnated with the Grotto or Oyster Marrow, which they, with confidence, recommend to the Public generally, being quite as early, and nearly double the size of any other Pea in cultivation. Quite hardy, will stand the winter well, and a good bearer; the pod large and long. They would particularly recommend it to the attention of Market Gardeners. Price 3*s.* per quart; 10*s.* per gallon; 17*s.* 6*d.* per peck; 30*s.* per half-bushel; 2*l.* 10*s.* per bushel. Agents:—Messrs. FIELD and CHILD, 119, Lower Thames-street, London; Messrs. W. and J. NOBLE, 152, Fleet-street; Mr. KERNAN, 4, Great Russell-street, Covent Garden; Messrs. HURST and MCMULLEN, 61, Leadenhall-street; Messrs. GRAY, ADAMS, and HOGG, Kensington.—Northwarnborough Nursery, near Odiham, Hants, Jan. 5, 1844.

THE BRITISH QUEEN AND PRINCE ALBERT PEAS.

WM. JNO. CORMACK begs to call the attention of

Noblemen, Gentlemen, and others, to the above two new Varieties, the merits of which are thus noticed in the *Gardeners' Chronicle*. "THE BRITISH QUEEN on light soils, is the best of all kinds, and will drive Knight's Tall Marrow out of the garden." "THE PRINCE ALBERT, which has been cultivated in the Garden of the Horticultural Society during the season, produced Peas fit for the table *ten days earlier* than any other variety sown at the same time." Both varieties may be had in packages at 3*s.* 6*d.* each, at W. J. C.'s wholesale Establishment, Newcross, or the Bedford Conservatory, Covent Garden.

UNRIVALLED NEW DAHLIA.—DANIELS' MADELINE.

IN offering the above splendid DAHLIA to the Public, C. D. begs to state that it is admitted by every Judge who has seen it to be superior to anything in its class; colour bright lilac; warranted first-rate, and constant throughout the season. It took the first seedling prize at Spreatley, in 1842. Last season, owing to the earwigs and thrips, C. D. was unable to show it for competition until all the principal shows were over. As this Flower has not been submitted to the London Floricultural Societies, purchasers will not be required to pay for it unless it proves satisfactory. Reference as to its quality can be given to the most respectable Judges. The principal Amateurs who have seen it have already ordered it for Class-showing, &c. Ground Roots, 3*l.* 3*s.*; Plants in May, 10*s.* 6*d.* each. The usual discount to the Trade where six plants are ordered.

The following Nurserymen will be able to supply Plants of it in the spring:—Mr. KEYNES, Salisbury; Mr. CATLEUGH, Chelsea; Mr. EDWARDS, York; Mr. HARRISON, York, and Messrs. LONG and McINTOSH, Beverley.—Hessle Road Nursery, Hull, Jan. 1844.

EARLY PEAS, &c.—HENRY D. CORMACK, SEEDSMAN, &c., begs to inform the readers of the *Gardeners' Chronicle* that they can be supplied with the following Early and Prolific Varieties, viz.: Cormack's Prince Albert, British Queen, and Early Kent Peas; Taylor's Improved Windsor, and Johnson's Wonderful Bean; Manchester Red and Seymour's White Celery, Walker's Long and Hamilton's Cucumber, &c., with every other variety of Horticultural and Agricultural Seeds, at his Wholesale and Retail Seed-Warehouse, 166, Deansgate, Manchester.

J. G. WAITE, WHOLESALE SEEDSMAN, London, begs to acquaint the Trade generally that he has made a Selection, at very great expense, from the finest Stocks in England, and other parts of the world, and can warrant the whole of the Seeds genuine, of the first quality, and the present year's growth. The prices are 30 per cent. lower than at any other house in the trade. Six months' credit allowed where a satisfactory reference is given; 5 per cent. deducted for cash. Catalogues to be had on application at his warehouse, No. 4, Eyre-street-hill, Hatton Garden, London.—Jan. 6, 1844.

ROBERT COOPER begs to inform his Friends and the Public that he has published his CATALOGUE OF CHOICE FLOWER-SEEDS, &c. &c. for 1844, which he can with confidence recommend, most of them having been grown by himself at his Nursery. Catalogues forwarded by post, on application.—Sion Nursery, Croydon, 1st Jan., 1844.

DOUBLE ITALIAN TUBEROSE ROOTS.—The above have just been received from Italy in a sound and healthy condition, and are warranted DOUBLE, at A. CORBETT'S, late Mr. BARRONS', Italian Warehouse, 18, Pall Mall. Price 4*s.* per dozen. Also a choice collection of Orange and Lemon Plants, &c., varying from two to six feet high, with strong Grafts and Heads, from 8*s.* to 25*s.* each. Catalonian and Arabian Jasmines, &c. Lists with prices per Post, &c.

CABOOL MELON, advertised November 18, is all disposed of. JOHN ROSS, Gardener, Holme, Cawdor, N.B.

HARDING, MARCHAND DE BOUQUETS, No. 1, Clifford-street, Bond-street. — WEDDING-ORDERS promptly executed, Bouquets carefully packed for the country, Glass Flower-tubes for Ladies, and Gentlemen's Fancy Basket Bouquet-holders, Vases, Lace-papers, various Works on the Language of Flowers, &c.

Just published, the Farewell to Scotland, "What though I leave thee, Scotland dear," &c., a National Song, written and sold by C. T. HARDING, price 2*s.*, as sung by Mr. W. HARRISON, of the Theatre Royal, Drury-lane, with enthusiastic applause; the music by JOHN GRAY, with a first-rate Frontispiece of Emigrants leaving Scotland, by the celebrated BRENDARD.

N.B.—A liberal price will be given for choice Cut Bloom. Apply, post-paid.

LONDON, EDINBURGH, and DUBLIN LIFE ASSURANCE COMPANY,

No. 8, Charlotte-row, Mansion House; and 55, Chancery-lane, London.

Trustees.

K. Kingsford, Esq. | B. Hill, Esq. | J. Bidden, Esq.

Directors.

Kennett Kingsford, Esq., Chairman.
Benjamin Hill, Esq., Deputy-Chairman.

Alexander Anderson, Esq.	James Hartley, Esq.
John Atkins, Esq.	John M'Guffie, Esq.
James Bidden, Esq.	John Maclean Lee, Esq.
Captain F. Brandreth.	J. Marmaduke Rosseter, Esq.

Auditors.

H. H. Cannan, Esq. | Robert E. Allison, Esq.

Medical Adviser.—Marshall Hall, M.D., F.R.S., L. and E.
Solicitors.—Messrs. Palmer, France, and Palmer.

THIS IS THE ONLY COMPANY who are bound by their deed of Constitution not to dispute any policy, unless they can prove that it was obtained by fraudulent misrepresentations; and numerous cases have shown how worthless may be a Policy obtained from the most influential office, which is unrestrained by this equitable principle, which removes all anxiety as to future dispute or litigation, and enhances immeasurably the value of the Policies as documents of security.

THIS IS THE ONLY COMPANY who give to the assured on the mutual principle the whole of the mutual accumulations, and also guarantee the sums assured.

THIS IS THE ONLY COMPANY who bind themselves to pay the sums in the Policies, although the debts for which they were effected shall have been liquidated before the claims arise.

THIS IS ALMOST THE ONLY COMPANY who grant in favour of creditors *whole-world Policies*, whereby the debt is secured, although the debtor should go beyond the limits of Europe.

The premiums, calculated according to the Carlisle tables, are lower than usual upon young lives, where participation in the profits is not required; and for short assurances, which at the option of the assured may be continued for life, the rates are as low as a due regard to complete security will permit.

Triennial Ascending Scale to assure £100.

Age	First 3 Years	Second 3 Years.	Third 3 Years.	Fourth 3 Years.	Remainder of Life.
25	£1 2 7	£1 9 9	£1 16 11	£2 4 1	£2 11 3
35	1 9 9	1 19 6	2 9 3	2 19 0	3 8 9
45	2 1 0	2 14 10	3 8 8	4 2 6	4 16 4
55	3 11 1	4 10 9	5 10 5	6 10 1	7 9 9
60	4 8 11	5 17 4	7 5 9	8 14 2	10 2 7

BY THE HALF-PREMIUM PLAN only one-half of the first seven years' premium is required, the other half being payable at the convenience of the assured; thus allowing a Policy to be continued for seven years, at one half of the usual rate, or to be dropped at one-half of the usual sacrifice; and entitling the assured, seven years hence, when loss of health may prevent him from effecting a new assurance, to continue a Policy at a rate of premium applicable to an age seven years younger.

Prospectuses and Schedules are forwarded to applicants, free of expense, by the manager and Agents.

ALEX. ROBERTSON, Manager.

AUSTRALASIAN COLONIAL and GENERAL LIFE ASSURANCE and ANNUITY COMPANY, 126, Bishopsgate-street, Corner of Cornhill.

Capital £200,000, in 2000 Shares.

DIRECTORS.

E. Barnard, Esq., F.R.S.	Gideon Colquhoun, Esq.
Robert Brooks, Esq.	C. E. Mangles, Esq.
Henry Buckle, Esq.	Richard Onslow, Esq.
John Henry Capper, Esq.	William Walker, Esq.

BANKERS.—Union Bank of London.

COLONIAL BANKERS.—The Bank of Australasia (incorporated by Royal Charter, 1835), No. 2, Moorgate-street.

PHYSICIAN.—Patrick Fraser, Esq., M.D., No. 62, Guildford-st.

SECRETARY.—Edward Ryley, Esq.

ASSURANCES may be effected with this Company at unusually favourable rates, affording every variety of accommodation to the Assured. Participation in Profits, ascending and descending scales of premium, permission to retain one-third of the premium, which is charged as a debt against the policy, tables for the assurance of a sum payable in the event of death to the executors of the Assured, or to himself upon the attainment of the ages of 45, 50, or 60.

To EMIGRANTS to the AUSTRALASIAN COLONIES assured for the whole life, this Company offers the advantages of permission to proceed to, to reside in, and to return from those colonies without extra premium, and to pay their premiums there.

All questions relating to Assurance and Annuities, addressed to the Secretary, will receive immediate attention.

ACHILLES BRITISH AND FOREIGN LIFE ASSURANCE ASSOCIATION, 46, Moorgate-street.

Loans granted to policy holders.

Every description of Life Assurance may be effected upon a moderate scale of premium, either with or without participation in profits.

Endowments for children or widows, and Immediate or Deferred Annuities, granted upon fair and equitable terms.

Loans may be obtained on personal or other security by individuals assuring their lives with this Association.

Risks taken on the Lives of Master Mariners and Passengers by sea, either for the whole term of life, or for the voyage.

EDWARD GILBERTSON, Secretary.

Prospectuses and every other information may be obtained by applying at the Offices, 46, Moorgate-street, City.

HOT-WATER APPARATUS FOR HEATING HORTICULTURAL BUILDINGS, DWELLING-HOUSES, CHURCHES, and MANUFACTORIES, upon improved principles, and at very moderate charges, erected by DANIEL and EDWARD BAILEY, 272, HOLBORN.

D. and E. BAILEY having devoted much time to the consideration of this subject, and had much experience in the erection of apparatus for the above-mentioned purposes, have, by improvements suggested in their practice, rendered their mode of heating not only very efficient, but very simple, and have combined durability in the apparatus with economy in the charge. They have erected apparatus in England, Scotland, and Ireland, for many noblemen and gentlemen, and have had the honour to be employed by the Horticultural Society of London, in executing the works of their splendid Conservatory, lately erected at Chiswick.

D. and E. BAILEY also construct in metal all descriptions of Horticultural Buildings and Sashes, and invite noblemen, gentlemen, and the public to an inspection of their various drawings and models, at 272, Holborn, where they have the opportunity of exhibiting, amongst other metal works, an extremely complete and convenient kitchen apparatus, or range, adapted for the continued supply of hot water, and an arrangement of the oven more complete than has hitherto been brought before the public.

D. and E. BAILEY were the first to introduce metallic curvilinear houses to horticulturists, and can refer to the Conservatory attached to the Pantheon as one of their works, besides many others in this country and on the Continent.

D. and E. BAILEY have prepared a quantity of the Galvanic Plant Protectors, which are now ready for immediate delivery; they beg to introduce to public notice a new Trough Pipe, for Orchidaceous or other Houses where vapour is constantly, or at intervals required, and which may be seen at their Manufactory.

THE CONICAL HOT-WATER BOILERS, invented by J. ROGERS, Esq., may be obtained of any size from JOHN SHEWEN, Ironmonger, &c., Sevenoaks, Kent.

J. SHEWEN having had every opportunity afforded him by an extensive practice to bring this apparatus to perfection, begs to offer it as most efficient and economical: it may be seen at Messrs. Chandler & Sons' Nursery, Vauxhall; Messrs. Loddiges', Hackney; Messrs. Henderson's, Pine Apple-place; Messrs. Veitch and Son's, Exeter; Mr. Pontey's, Plymouth; the Royal Botanical Society's Gardens, Regent's Park; and at the Gardens of the Horticultural Society of London. Considerable improvements have been effected since last season; particulars of which are in course of preparation.

RENDLE'S TANK SYSTEM OF HEATING.

STEPHENSON AND CO., 61, Gracechurch-street, London, Inventors of the IMPROVED CONICAL and DOUBLE CYLINDRICAL BOILERS, having been much engaged in heating buildings upon the above system with Tanks of various materials, solicit the attention of scientific Horticulturists to an Iron Tank now fitting up on their premises, which offers most decided advantages over every other article hitherto employed for the same purpose. These tanks which are ornamental in appearance can be made from 10 to 100 feet long and of any width and depth, and can be connected or disconnected by any working Gardener without the slightest difficulty, thus affording the opportunity to persons in remote districts of employing this much approved method of heating without the assistance of Engineers. The Tanks can be applied to Boilers and Pipes already fixed, and from the present low price of Iron will be found cheaper than of any other material. MR. RENDLE, of Plymouth, has kindly undertaken to receive orders and furnish information to any persons in his neighbourhood, and prices for any size will be forwarded upon application to S. and Co.

A COMPANION TO THE PEERAGE AND BARONETAGE.
Now ready, Parts I. and II. (to be completed in Four Parts, price 10*s.* 6*d.* each), of Mr. BURKE'S

HISTORY OF THE LANDED GENTRY; A GENEALOGICAL AND HERALDIC DICTIONARY of the Whole of the Landed Gentry, or Untitled Aristocracy of England, Scotland, and Ireland, to be comprised in a single volume, of 1600 pages, beautifully printed in double columns uniformly with the Author's popular

"Peerage and Baronetage."

"A work which contains curious information, nowhere else to be found; and to which even professional Genealogists may refer with advantage."—*Quarterly Review.*

HENRY COLBURN, Publisher, 13, Great Marlborough-street.

London: JOHN MURRAY, Albemarle-street, Publisher to the Royal Agricultural Society of England.

THE FARMERS' LADIES' LIBRARY OF RURAL AND HOUSEHOLD ECONOMY.

Each Volume, strongly bound, may be purchased separately.

Vol. 1.—GARDENING—With a Calendar of Practical Operations and Directions for every Month in the Year. By MRS. LOUDON. With Woodcuts. Sixth Edition. Fcap. 8vo., 6*s.*

Vol. 2.—BOTANY—A popular Introduction to the Natural System and Classification of Plants. By MRS. LOUDON. With 150 Woodcuts. Fcap. 8vo., 8*s.*

Vol. 3.—FARMING—Plain Directions for Rearing all sorts of Domestic Poultry; with the best mode of Managing the Dairy and Piggery, together with useful Hints on the Rural Economy of small Families. By Author of "British Husbandry." With Woodcuts. Fcap. 8vo.

Vol. 4.—DOMESTIC COOKERY—Suited to the present advanced state of the Art, but founded upon Principles of Economy and Practical Knowledge. By MRS. RUNDELL. Sixty-Seventh Edition. Improved by the addition of Nine Hundred New Receipts, and a Chapter on Indian Cookery. Fcap. 8vo., 6*s.*

*** *Of this Volume upwards of* 280,000 *Copies have been sold.*

Vol. 5.—FAMILY RECEIPTS—A Collection of more than a Thousand valuable Receipts in various Branches of Domestic Economy. New Edition. Fcap. 8vo., 5*s.* 6*d.*

JOHN MURRAY, Albemarle-street, Publisher to the Royal Agricultural Society of England.

Now Ready, Atlas Folio. Price 5*s.* Part I.

LEAVES FROM THE BOOK OF NATURE.—Under the above Title will be published, apart from the descriptive matter, the entire Illustrations contained in SIR W. JARDINE'S NATURALIST'S LIBRARY, lately completed.

Several subjects, selected from one class, whether Birds, Beasts, or otherwise, will be tastefully arranged in a large sheet, five of which sheets, contained in a cover designed for the Work, will form a Part, price 5*s.* On the completion of the Series directions will be supplied for the proper arrangement of the whole into their respective Classes.

PART I. contains, on five sheets, twelve Plates of Sun Birds, eleven of Dogs, nine of Humming Birds, twenty-two of Foreign Butterflies, and fourteen of British Fishes.

S. HIGHLEY, 32, Fleet-street, London; W. H. LIZARS, Edinburgh; CURRY and Co., Dublin; and all booksellers, &c. in the kingdom.

This day is published, price 2*s.*,

A LETTER to NASSAU WILLIAM SENIOR, Esq., in Reply to the Article, "FREE TRADE and RETALIATION," in the *EDINBURGH REVIEW*, No. 157. By R. TORRENS, Esq., F.R.S.

"Colonel Torrens and Mr. Senior have both acquired great reputation as political economists; and a controversy dignified by their names can be neither uninteresting nor unimportant."—*Morning Chronicle.*

"This able performance is far beyond a controversial triumph, and treats of most of the questions of internal policy and international commerce, on which the weal or woe of the empire depends, in a masterly manner."—*Literary Gazette.*

"A masterpiece in controversy."—*Spectator.*

SMITH, ELDER, and Co., Cornhill.

On January the 8th, 1844, will be published, handsomely printed in Demy 8vo., Part the First, Price 12*s.*,

SPECIES FILICUM; OR A SYNOPSIS OF ALL KNOWN FERNS. This first part contains GLEICHENIACEÆ, POLYPODIACEÆ in part, and PLATES I. to XX. By Sir WILLIAM JACKSON HOOKER, K.H., L.L.D., F.R.S., &c., &c., Vice President of the Linnean Society, and Director of the Royal Botanic Garden at Kew.

*** It is intended to publish Part the Second on the 1st March, 1844.

London: WILLIAM PAMPLIN, 45, Frith-street, Soho-square.

JAMES PAMPLIN begs to announce that the Catalogues of his NEW PELARGONIUMS of the season are now ready, and may be had, on application, addressed to Whip's Cross Nursery, Walthamstow, Essex.

TO CULTIVATORS OF PEARS.

T. RIVERS, JUN., begs to announce that his Descriptive Catalogue of Pears with some directions for their Culture, as root-pruned Pyramidal, Conical, and Quenouille trees, of which wood-cuts are given, is now ready for delivery, to which is appended a Supplement to Catalogue of Fruits. The Pamphlet will be sent, post-free, for 1s. 6d., on receipt of a paid application. Sold also by Messrs. LONGMAN & Co., and at 4, Great Russell-street, Covent Garden. The Catalogue of Pears is printed separately, and will be sent to applicants on receipt of a two-penny stamp.—Sawbridgeworth, Herts, Jan. 4, 1843.

THE subject of WARD'S CASES having been again brought into notice by the Horticultural Society, who have offered certain prizes for them at the Exhibitions next year, it seems desirable to make a few remarks upon them in addition to what has been stated on former occasions.

Mr. Ward's pamphlet* contains, indeed, all the information that can be given; but it is in few hands, and everybody does not understand the principles on which his cases are constructed. It is imagined by uninformed persons that entire exclusion of air is the great object which Mr. Ward sought to secure by his contrivance. But we need hardly tell the reader who knows anything of the atmosphere, that such an effect cannot be attained by a Ward's apparatus: the air finds its way into every place not hermetically sealed, and such contrivances as close-glazing, puttying, and so forth, cannot exclude it. What Mr. Ward sought to gain was uniform moisture and an exclusion of soot; and these he effectually secured. It is the dryness of the air that destroys plants in sitting-rooms and great towns, and not impurities in the gaseous constituents of the atmosphere, the importance of which has been singularly overrated. By inclosing plants in tightly-

glazed cases light is admitted, soot is excluded, and any desired amount of moisture is securable.

There are, however, some practical difficulties in the way of growing plants in close moist cases, which Amateurs unacquainted with the nature of plants are unable to overcome, but which a sensible gardener, who does not belong to the "drowsy" school, would easily remove; and with a view to the accomplishment of this, Ward's Cases were admitted to the Exhibitions of the Horticultural Society. Among those difficulties, the principal is the adjustment of the amount of moisture to which a plant is exposed in one of the cases, to the surrounding heat and to its own proper nature. Another is the prevention of dew upon the inside of the glass, by which the interior is often entirely hidden. These are practical difficulties, that must exercise the ingenuity of cultivators. Upon the former we can give no information, because each species requires a special consideration. As to the deposit of dew upon the glasses we may observe, that since this is owing to the inside of the case being colder than the air that surrounds it, the only course to take is either to warm the internal air by some means, or to open a door in the case for a short time; and as the latter is the most easy, and is quite efficient, it will be the more generally adopted. Opening the door is an advantage rather than a disadvantage to the plants, if not continued too long.

The reason why these ingenious contrivances have not been more generally adopted, is owing, we conceive, partly to the difficulty of managing them and partly to the Ward's cases which are sold in the shops being remarkably ugly. The former difficulty will, we trust, be removed by degrees, when gardeners turn their attention seriously to it. In order to assist in diminishing the opposition which arises out of the inelegant appearance of the cases, we submit the accompanying designs, which any ingenious workman can readily execute either in brass, or bronze, or iron. The shorter of the two must stand on legs, the other will require no such support; both of them may have doors in the roof.

* On the Growth of Plants in closely-glazed Cases, by N. B. Ward, 8vo., 1842.

IT is of no use now to ask, how many years it takes to procure those GREAT PINES, in the mere existence of which men would not believe; it is of no use to inquire how much they cost; it is idle to make calculations any longer as to the average number of pounds of fruit which a dozen square yards of Pine-soil will produce, or to assert that 20 Pines, of 3 lbs. each, are just as good as 10, of 6 lbs.—an argument worthy of a market-gardener, and of no one else. The floor on which such reasoners have been standing is knocked from under them; for Mr. Barnes, one of the most successful, sensible, and experienced of modern gardeners, has publicly explained his mode of practice, and shown, that with no more expense, space, or trouble—on the contrary, with less of all, but with a good deal more skill and common sense, all those incredibilities, which we have been blamed by the stand-still gardeners for making public, are attainable.

He has shown, too, other things. He has not only exposed the folly of the doubters and speculators and cavillers, of whom we have lately heard so much, but he has completely confirmed the justice of our assertions, that we are only on the eve of discovering the true mode of Pine growing, and that in the cultivation of the Pine we have a most striking illustration at once of the value of charcoal, and of the one-shift system, advocated by Mr. Wood.

Although we do not feel ourselves at all called upon to pay attention to the foolish distinction drawn by uninformed persons between what they are pleased to call theory and practice, yet, on this occasion, it may be as well to remind them that Mr. Barnes, of Bicton, is, in the strictest sense of the word, a practical man—a very sensible one, no doubt; but still, such an intelligent practical man as you will find many of, all over the country: not, indeed, one of those practical men, who, as he says, "lie in bed half the day, and walk about the other half with their hands in their pockets" (p. 696); but a gardener full of zeal and knowledge, who has followed his calling for more than 30 years, self-taught, aware of his own deficiencies, as all men of sense are, no trumpeter of his own merits, great as they are, but hard-handed, hard-headed, earnest, and industrious; relying upon his own resources, and not, like the countryman in the fable, crying out to Jupiter to help him out of every heavy road into which he may have driven his team. In short, he is not one of those fine gentlemen who lay the blame on their men, or anything rather than themselves, for the mischief that arises out of their own incompetence, but exactly what a good gardener always is. Such is the man whose statements regarding the Pine-apple we are now about to quote in favour of our own views of what the management ought to be. The account to which we refer is in the "Gardeners' Magazine," just published, and of which we regret to announce the termination. The more essential points appear to be the following, in addition to what *good* Pine-growers already practise.

There is no disrooting. How men could have ever fancied that the best way of making a Pine plant grow is to cut off its roots, it does, pass our skill to imagine. Mr. Barnes most properly exposes *that* folly.

"I know it is considered by many practical men that the Pine-plant is an annual-rooted plant, and that it requires disrooting in the spring; practice has convinced me of the contrary; but unnatural treatment too often causes it to lose its roots, not only annually, but several times in the course of the year. It is stated by others that it is impossible to grow or cultivate this beautiful fruit in some localities, for the want of proper soil; I am perfectly convinced that the obstacle is not so much the want of proper soil as the want of knowing what proper soil is, how to get it healthy, and to keep it healthy." In fact disrooting a plant is like drawing a man's teeth in order to make him eat.

Soil, again, has been looked upon as a great consideration. The French swear by peat, the English by loam the South Americans by sea-sand. But, says Mr. Barnes—"Practice and observation have taught me that the Pine-apple may be produced to very superior perfection in any locality, and that any soil that will produce tolerably good Wheat will grow good Pine-apples, and so will soil that will produce nothing but stunted Furze-bushes, Brambles, and short-starved Heath, &c. The defect is in the means employed in getting it into a healthy pure condition, and keeping it so with heat, light, and water, all pure and acting together. We have no bad soil in this country; it is only our ignorance makes us think so. How often have I heard men remark, on observing plants, fruit, &c., at a neighbour's superior to their own, 'Had I but your convenience, soils, &c., I could produce as good;'—how familiar these remarks are to me! It is one step, certainly, to get the soil where your neighbour gets his from; but without making use of it in a proper condition there will still be disappointments. My own idea is, that the soil is the stomach of the plant, and without the stomach is in a pure and healthy condi-

tion, and means applied to keep it in that condition, how can we expect vegetation to thrive and continue vigorous and healthy? The soil I have made use of these last three years is *from a hungry situation on a common, where some poor, starved, stunted Furze-bushes grow from 4 ins. to 8 ins. high*, and some Heath and stunted Brambles here and there; the sub-soil a rank red clay; *I do not know where to look for soil that to all appearance is poorer.* My system is to cut the surface about 2ins. or 3ins. in thickness, with a mattock, in sods, or turfs, as it is termed in some places, with bushes and whatever vegetation there should happen to be growing on it besides, in dry weather in summer; taking it home, and stacking it snugly together, without adding the least particle of manure or anything else whatever. I make use of it *in as rough a state as possible*, Furze bushes and all, without anything whatever being added, only preferring it to lie together a sufficient time to kill the vegetation, that it may not become troublesome by growing amongst the plants, and never by any means making use of it when rotted down; I would sooner use it quite fresh and green. *My reason for using it in a rough state, and without being decayed to any extent, is that the atmosphere, heat, and water, may have an opportunity of acting* in unison with the salts, limes, &c., of the earth; and good drainage and some coarse charcoal on the top supply the means of all acting together in the healthiest manner."

We beg the reader to pay particular attention to these directions, and especially to compare them with what Mr. Wood is always insisting upon, viz., the indispensable necessity of a coarse permeable soil. We will also ask him to compare them with the common directions to grow plants in *finely sifted* soil. Comment is at present unnecessary.

We shall resume this subject next week.

ROT IN LARCH.

In the *Chronicle* of the 2d Dec., p. 842, I find Mr. Wighton, in his observations on the rot in Larch, inclined to attribute that disease to an excessive, or over rampant, growth of the plant when young; and not, as is generally supposed, to the nature of the soils in which it occurs. If, indeed, Mr. Wighton could prove that the growth of the Larch when young, upon soils where the disease shows itself at an earlier or later period, was invariably of the rapid description he insinuates, or that in such cases it was quicker, or even equal to that of the tree where it perfects its heart-wood, and shows no signs of decay up to an advanced age, then I confess his hypothesis might appear plausible, and to have some foundation in fact. My own experience, however, which extends over a period of nearly 40 years, during which I have been a planter of the Larch to a considerable extent, and upon a variety of soils, leads to a different conclusion, and convinces me that the disease is to be attributed entirely to the nature of the soil in which it occurs; but whether to an excess of various constituents in such soils, or to a deficiency of some peculiar quality necessary to give perfect maturity to the wood, that is, to bring it to the state known as sound heart-wood, still remains a matter for further investigation; and perhaps is only to be found by a strict chemical analysis of these rot-producing soils.

That the growth of the Larch upon land subject to produce the rot is always of the rapid description assumed by Mr. Wighton is certainly not the case; on the contrary, where the disease appears at an early period, say when the trees are from 12 to 14 years old, their growth is comparatively slow from the time of their being planted; and the unsuitableness of such land for the production of Larch timber is at once apparent; even upon soils less deleterious, where the disease makes slower progress, and does not show itself prominently till a later period, the annual shoots of the trees when young are seldom equal, either in point of strength or length, to those of healthy Larch in soils congenial to its habit, where it lives to attain maturity, and produces that rich-looking and valuable timber for which it is celebrated. Neither can I assent to Mr. Wighton's assertion, that the best and most durable Larch wood is that produced by trees of the slowest growth, and upon poor soils; on the contrary, I find that the finest specimens of Larch timber are the produce of trees not only of the largest dimensions, but of such as have grown rapidly and luxuriantly from their earliest youth up to an advanced age. At Dunkeld and other parts of the Scottish Highlands, where the finest Larch timber is produced, it might be supposed from what Mr. Wighton says, that there the trees were of tardy growth; but let any one go and examine the noble Larches which shoot up in towering spires in the deep glens and mountain declivities of that interesting and romantic country, and knowing their age, then say that their growth has been slow, or inferior to that of the Larch in rot-producing soils. Neither can the soil at Dunkeld, and other Highland districts, be deemed of the poor description inferred by Mr. Wighton; on the contrary, it is in many parts deep and good; not that it contains much vegetable matter or humus, but is composed of the disintegrated rocks and *debris* of the older series, which is more congenial to the habits of the Larch and others of the Coniferæ than formations of a more recent period. In respect to my own Larch, I know that the finest trees producing the soundest timber grow upon ground of good quality, provided it be not immediately incumbent on sandstone of recent formation. In a deep dene or glen, where the rock is one of the lower mountain or metalliferous limestones, many Larches, though not more than 47 years old, have attained a height of 80 feet and upwards, and a circumference of bole, at two feet from the ground, of nearly six feet. Of two trees (by no means the largest in the dene), cut down about a fortnight ago, the length of one was found to be nearly 69 feet—of the other, about 73. The sap-wood was not more than three inches thick, the rest being heart-wood, of a rich colour and excellent quality. When squared and sawn up, planks of 18 feet in length and a foot in width were obtained from the butt-ends. It is almost unnecessary to add, that these trees had grown at a rapid rate from the time they were first planted, much more so than others upon ground where the taint begins to show itself when they reach their 16th or 20th year. In the "History of British Forest Trees," published by J. Van Voorst, an enumeration of the different descriptions of soil in which the Larch is liable to the heart-rot is given, drawn as well from the observations of Mr. Matthew, as from those of the author himself. Upon such it would be in vain to plant the Larch in the expectation of obtaining large and sound timber; nevertheless I still advocate its liberal insertion in plantations upon such soils, as it is, even under these circumstances, the most profitable temporary occupant that can be planted, affording at the various thinnings, a supply of valuable material for minor purposes, provided it be taken down before the disease has advanced too far. In conclusion, I would say, let not the planter (provided his ground be sound, that is suitable to the habit of the tree) be at all alarmed at Mr. Wighton's declaration, that a rapid growth of his Larch is only laying the foundation of useless timber.—*P. J. Selby.*

THE SEEDS OF GARDENING.—No. I.

Of all the systems by which plants are obtained there is none so beautiful or so perfect as their development from seeds; yet, assuredly, none so much neglected, I might say despised, as this primeval plan of propagating. The exquisite delicacy of the workmanship that folds the future plant in the small cell of the seed must be evident to all; the globular form that many seeds take, and the general contour and character of all, show how admirably the seed is adapted to transport the species and secure its welfare.

The extent to which certain valuable plants may be increased by merely depositing seeds in the earth without further care or trouble, is truly marvellous; witness the vast forests of Fir-trees from seeds strewn on the mountain, and the fields of yellow Corn from grain scattered on the fallow ground; and at this season of the year, when the Yew-trees are laden with their rosy fruit—the inglorious prey of the greedy mouse and undomesticated fowl, the unbroken sunbeam, and the hurricane unchecked pass over the treeless strath and lone hill side, where the only shelter is a fox's cave, and the only shadow that of some ruthless crag. And how little of human aid is wanted to enable the Yew, that truly British evergreen tree, to extend itself by thousands in such situations, at no expense save the labour of the patriotic hand that strews the high ground with a basket of Yew-berries! and though years must elapse ere this verdure arise, yet, assuredly, it would come, and that not for a season or an age, but for a thousand years. If your readers would only look over their Yew-trees whilst the twigs are yet laden with their rosy-cupped seeds, requiring no further culture than a clear space of earth as large as the nail of the finger that deposits them, I think many would be induced to remove the beautiful germ of the Yew-tree, with its ruddy chalice, to a spot where it might dwell and become the parent of myriads, to the credit of the hand that gave it place, and the landscape which it and its progeny would adorn.

These, and thousands of other familiar examples, might be mentioned to show the immense importance that a right method of saving, preserving, and distributing seeds would be to mankind in general, and to gardeners in particular, whose livings mainly depend upon plants of which seeds are the primary stock. I flatter myself, therefore, that the time is come when neatness, order, and system, may, and indeed must be, introduced into the seed department of gardening, lest Chaos should come again; for if we average two thousand as the number of species cultivated in a modern garden of moderate extent, and conclude that one-half of these are either produced or produceable from seeds, we have a thousand separate moieties of plants in the germ to preserve from injury, arrange in order, and distribute with judgment, in time and place appropriate to their welfare and the wants of a family.

The coatings of most seeds, or, in other words, the inner packing-cases, assigned them by nature, are for the most part air-tight; and we frequently find the germs sealed up as it were in little bags or husks, in a sort of membrane, containing ingredients more or less soluble in water. Hence the necessity of keeping such seeds free from damp till they are wanted to germinate; yet it must equally be borne in mind that excessive dryness proves injurious to the vitality of seeds; for when the oily or glutinous matter in the coating of the seed gets dispersed, or drunk up by heat and dryness, the inclosed germ can no more live in that arid atmosphere, than a plant plucked up by the roots could live exposed to the heat and drought of sun and wind.

Now, although plants might, and indeed often do, endure exposure to the air, &c. in transplanting, and survive the shock, yet the infant germ, if stript of its mantle, or of that property which made its mantle weather-proof, soon shrivels, and after a time gets parched, and becomes in miniature "a dry tree." When seeds are quite ripe, they are assuredly in greater perfection than they can be afterwards; for the tales of old Melon seeds being superior to new ones, and such-like theories, are now pretty nearly exploded. Indeed, new seeds are found to resemble new eggs so much, that the systems resorted to by cunning housewives when eggs are cheap, to keep them sound till the price rise, are excellent and simple illustrations of the principles of preserving seeds. Eggs immersed in lime, or smeared with butter, and the cask in which they are packed occasionally turned to keep the yolk from settling, will preserve eggs marketable for many a day.

Now seeds of the Brassica tribe, of which more than one sort can hardly be saved in the same garden unadulterated in any one year, require some pains to preserve them, and a very simple and effectual method of doing this is to oil their outer coats by giving them a good shaking in a rough woollen bag made slightly greasy with oil of Turnip-seed or salad oil; this operation being to them a regular brushing and polishing, not only preserves the seed, but brightens the sample and makes it more marketable and sleek in the coat, which sleekness, it is well known, is one of the tests of new and fine seeds—the coating of lime by excluding air and preserving uniformity of temperature and dryness, is perhaps the simplest safeguard that could be used in the sound keeping of seeds.—*A. Forsyth, Alton Towers.*

(To be continued.)

DR. THACKERAY'S WELCH PLANTATIONS.

The following authentic account of the places where Dr. Thackeray's plantations have been made will interest every one who has an opportunity of visiting North Wales. We hope to be soon able to lay before our readers a full account of the system of management observed in them. In the meanwhile we may state that nearly 5000 beautiful Oaks of five years' growth have been this autumn transferred from Dr. Thackeray's nurseries to vacancies in the woods, and that all boughs are left in the plantations for the poor, who carry them away.

TURF ROASTING.

About two years ago, when conversing with a cultivator respecting the best compost for China and other Roses in pots, he mentioned that he had found thin parings of turf dried in the sun in summer, so as to kill the roots of the grass, a most excellent compost. I tried to bear this in mind as an excellent hint, but in the hurry of business it escaped my memory till the commencement of the summer of 1843, when, owing to the continual wet weather, I found myself unable to carry out the idea; drying the turves in an oven then occurred to me, but this happened to be inconvenient; a temporary furnace then struck me as being an efficient method, and this I quickly made by placing some loose bricks into three sides of a square about two feet in diameter and 18 inches high, leaving one side open for the admission of fuel: on the bricks I laid a stout piece of sheet-iron, so as to form a kiln; under this I made a brisk fire with wood, and then commenced kiln-drying. My pieces of turf, which were one inch or a little more in thickness, and about a foot in diameter, were suffered to remain in my temporary kiln nearly two hours, during which time they were turned several times: by this operation they were slightly blackened and charred on both sides, and every fibrous root completely killed; the turves were taken hot from the kiln, immediately chopped into pieces, from half an inch to an inch in diameter, mixed with an equal quantity of rotten dung, and used for potting Roses, with pleasing results; for their roots in a very short time penetrated every part of the compost, and the plants assumed a healthy and vigorous aspect; the drainage is also quick and complete, contributing in no small degree to the well-doing of the plants.

I need not point out to the cultivator the advantage of this simple process in destroying every wire-worm and grub that so often infest the finest turfy composts; the comfort and security felt in being certain that your compost is free from these plagues is worth something; and, indeed, it has been the only inducement for my troubling you with this detail. In large establishments a large kiln

may be prepared with four-inch brickwork, say from three to four feet in diameter, the height need not be more than eighteen inches, and some flat bars of iron may be placed across to support the sheet of iron; this will form a kiln of sufficient size to roast a large quantity of turf. I have reason to believe that turf, even from the most retentive soils, will be rendered by fire-heat thus applied, light and porous, and fit for pot-compost for most plants. —*T. Rivers, Jun.*

BEES.—No. I.

"Bees," says Cobbett, "are of great use in a house, on account of the honey, the wax, and the swarms that they produce; they cost nothing to keep, and want nothing but a little care." If there is anything more profitable to the gardener or cottager, and can be more easily managed by him than a few swarms of Bees, all that I can say is I have never seen that thing. All men, especially those of narrow incomes, should principally endeavour to gain a knowledge of those things which particularly concern their well-being. The gardener—to whom I address my remarks—cannot, I assert with confidence, dispose of an hour or two a week in a more lucrative way than in managing an apiary. Whilst the gardener is being taught how to make 10*l.* a year on an average of his Bees, the amateur too, I trust, will learn how to obtain a plentiful supply of honey and honeycomb. The only objection that can be raised to the keeping of Bees is that they extract the quintescence of flowers, and thereby impoverish or rather lessen the quantity of butter. I knew an old parsimonious farmer who was so fully convinced that Bees impoverished his fields, that he trod to death all that he could put his feet on. However, it is questionable whether Bees do diminish the quantity of butter; indeed, there are only one or two flowers which cows eat that Bees collect honey from. [This old farmer was a monstrous blockhead.]

Though Bees can be managed properly without a knowledge of the conformation of their heads, trunks, and abdomens; yet it is indispensably necessary to know some of their habits, or points connected with their history, which I shall now notice. In almost every hive there are at certain seasons of the year a queen or female, drones, males, and neuters, or Bees without sex. A queen-bee is 14 days in being hatched—takes the drone on from the first to the fifth day after she is hatched—begins to lay on the 10th day from the time she is fecundated—lives four years, generally speaking—and is, as her name implies, monarch of the hive. Neuters, or working Bees, are 21 days in being hatched—do all the drudgery of the hive—are loyal subjects, but have neither an hereditary nor an absolute monarchy—and are miserable, and work but little when they have not a queen either reigning or in embryo. Bees'-eggs are transmutable; that is to say, either females, males, or neuters may be obtained from them at the option of the apiarian.

The Hives.—What I lately said on the superiority of large hives is, I am sure, more than sufficient to induce all beemasters to keep their Bees in large hives; but as some say that once calling does not always awake sleepy men, and as I am anxious that this small treatise should be complete in itself, I shall here show, in the clearest way possible, that large hives are superior to small ones. Oh that Bee-book authors would use their reasoning powers or try experiments in order to find out how large hives ought to be! No person will ever pretend to say that a Queen-Bee can lay and cease to lay when she likes, or that she has control over the number of her eggs. Very well. Let us show with one or two simple experiments that by keeping Bees in small hives you force them to destroy two-thirds of the eggs which queens lay. Select three hives full of combs and Bees, take the queens from two of them, place one above another, shut the mouths of the upper two, which will compel the Bees to pass through holes (six inches in diameter); cut out off the crowns of the middle and uppermost hives, and you will find that the combs of the three hives will be as well filled with brood as they were before from the eggs of three queens. An equally decisive experiment is to exchange the queens of a small and a large hive. If a queen be taken from a hive containing 9 superficial feet of comb, and put into one containing 27ft., and the queen of the hive containing 27ft. put into that containing 9ft., you will find that the combs of the large one will be as well filled with brood as they were before the change took place. "According to Huber," says Dr. Bevan, at page 41 of the "Honey Bee," "a queen ordinarily lays about 12,000 eggs in two months, but," continues this celebrated author, "it is not to be supposed that she lays at the rate of 12,000 eggs every two months; she does so at the principal laying, in April and May." If the Doctor would be at the trouble of putting a swarm or two swarms united, weighing 8lbs. or 9lbs., with a queen that has finished her "principal laying," into a hive containing 24 superficial feet of comb, he would find at the end of seven days above 30,000 eggs set. At page 124 he says—"Whatever advantage the putting of two swarms into a hive may give to the family during the first year of its establishment, it can present none beyond that period; for the swarms that were introduced will have paid the debt of nature before its expiration, and are thereby reduced to a level with those that were not doubled." Dr. Bevan is wrong here, for a swarm that weighs 8lbs. hatches double the quantity of one that weighs 4lbs., and consequently double the quantity of Bees will live throughout the winter, set double the quantity of eggs in the spring, and so forth. In short, if you are not induced to keep large hives my design will be defeated, and every effort you make to obtain honey in great quantity, or boxfulls of honey-comb in great number, will be thwarted. The size I recommend for first or top swarms is from 20 inches to 24 inches wide, and from 12 inches to 15 inches deep; for second swarms about 18 inches wide, and 12 inches deep. The earliest swarms ought to be put into the largest hives. At page 116 of his "Honey-Bee," Dr. Bevan says, that hives 24 inches wide and 15 deep, are too large for any system of Bee culture, but he does not assign a reason why they are too big. If he had had a hive even 15 inches wide, he would never have recommended boxes 10 inches wide. I do not say that the largest size I recommend is the standard; for I am unable to say how many eggs a Queen Bee lays, but she lays enough to keep the combs of that size well filled with brood. Though it is impossible to prevent a superabundance of eggs at all times, yet the object which you ought to aim at is to let the Bees have plenty of accommodation, in order that there may be as few supernumerary eggs as possible. I have been very prolix on this point, in order to remove the fostered prejudice and long-cherished opinions which so mightily prevail and retard the progress of Bee-management. —*A. Pettigrew, Wrotham Park, Middlesex.*

(To be continued.)

Home Correspondence.

Summer Pruning.—About two years or 18 months ago there were a good many notices in the *Chronicle* of a plan of summer-pruning, by half breaking the new shoots, which was stated to be very beneficial, as throwing into fruit-buds those below the part broken. Now, on the whole, my experience is against this practice; the breaking the branch in July stops the deposit of the returning sap, and swells and enlarges the buds of the shoots beyond the fracture; and for two years I have observed that the best bloom-buds were made on the extremity of the shoot, so that I have retained the branch unpruned. With this subject is connected summer-pruning, and I have long waited for some detailed instructions on this important head. There is no one subject more difficult, and on which such contradictory instructions are to be found.—*Totty.*

On Summer-pruning Fruit-trees.—If we take into consideration the physiological fact, that by the agency of leaves the gases extracted from the atmosphere by those organs, and the juices drawn from the earth by the roots are mixed, assimilated, and rendered subservient to the tree, thereby increasing its growth and perfecting its fruit, the question arises—is summer pruning beneficial or injurious? A few words on this point. Admitting, then, that the leaves are the agents by which the juices of the tree are prepared to enter into its system, to take part in the various economy of life and the reproduction of its species, it is clear that by removing those leaves we diminish the resources of the tree. Now, in summer pruning, we remove at least one third of the leaves of the tree subjected to the operation, and Nature never clothes a tree with more leaves than is necessary for its resources at the roots; a proper harmony is thereby kept up between those two organs, and perfect health of the tree is the result. In summer-pruning we deprive the tree of its digestive organs without at all diminishing the absorption at the roots; the juices consequently not meeting with a proper surface of exposure, which, if no summer pruning had been performed, they would have done, are returned to the tree in a crude and unprepared state, the wood thereby is not of a natural texture and the fruit is deprived of its proper flavour. That the overabundant juices of a tree so treated make a vigorous effort to repair the injury is manifest, by the quick appearance of succulence from all parts of the tree; at once establishing the fact that it is overcharged with sap in a crude state. The growth of the tree at that period is not of the character of one slowly and gradually increasing in stature, but a rapid and simultaneous outbreak of the sap from all parts, even where no appearance of buds had previously existed. That trees left untouched till winter-pruning, with a whole summer's growth, are both unsightly and untidy, cannot be denied; and to leave them in that state to be broken by the winds of autumn, would evince carelessness, whatever good intentions there may have been in so doing, and would be highly censurable. But the tree may be rendered an object by no means unsightly without cutting away half its branches, as is the common practice; the latter may be topped, and when practicable, secured to the wall or whatever substance they may be trained upon; and when the period for general pruning comes, all superfluous branches can be removed. As the greater abundance of leaves is at the base of the shoots, the loss in topping and the occasional removal of a whole shoot, in comparison to the general practice, would be but trifling.—*Tyro.*

Currant-Trees.—The growing of Currant-trees as standards is not generally practised, and the advantages arising therefrom are likewise not generally known. I beg to state that if those who make plantations of this useful fruit would plant a row of standards and a row of dwarfs alternately, the advantage gained in ground would be considerable; and rows of standards with finely-formed heads and neatly staked have a very interesting appearance. I have seen fruit that was grown on standards superior to that obtained by the common method of cultivation, and the cultivator may protect and thin the bunches with great ease; they may be trained in nursery beds until they are fit to be planted out.—*W. C. S.*

Cultivation of Salvia splendens for Winter Flowering.—About the middle of August, or as soon as there is the slightest appearance of bloom, I take off cuttings from the strongest shoots, immediately below the third joint, and insert them singly in small 60-sized pots, and plunge them in a brisk bottom-heat under a hand-glass in a compost of leaf-mould, dung, and sand, in equal proportions, taking especial care that the cuttings do not droop, but continue to grow on, the same in appearance as when taken from the parent plant. When the cuttings are well rooted, shift them into the next sized pot, and continue to shift them until firmly established in 48-sized pots. This fine plant is a great acquisition to the Conservatory, especially in the dull months of November, December, and January.—*Quercus II.*

Digging among Fruit-trees.—The observations lately made in the *Chronicle* respecting digging among Strawberry-plants, are also applicable to fruit-trees. I have a Pear-tree, of a very great age, growing in what used to be a garden; but seldom or never produced what might be considered a crop of fruit, until within these last 20 years, when the piece of ground has been converted into a wood-yard, and all digging abandoned. Since that time it has every year bloomed profusely and matured a good crop of excellent fruit; in all probability resulting from the ground not being dug about it.—*William Savage.*

Acquired Habits.—It is not generally known that plants brought from other countries still retain their peculiarities as regards time of growing and flowering. It is very remarkable that they should not be under the influence of the seasons in this country, as to be affected in their growth, &c.; for if brought from other parts of the world where our winter is their summer, they still continue true to their time of growing and flowering, as in the instance of Primula sinensis, Pæonia Moutan, Tropæolums, Cyclamen persicum, &c.; nothing short of frost will prevent their revival at their accustomed time. Can you say by what laws they are governed—is it instinct? Why should the principle of life continue in them dormant during our summer, while all around it is in full activity? A solution of this mystery would give great pleasure to the scientific world, and would be highly appreciated by Zpro. [This is no doubt a very curious subject; but we have no leisure just now to go into a discussion about "acquired habits;" we must leave it in the hands of our good correspondent].

Figs.—Methods for the improvement of fruits of almost all kinds have been given in the *Chronicle;* but little has been said about the Fig. If this fruit is of less consequence in a general way than the Peach or Vine, in some cases it is more regarded than either, and I would request communications respecting its culture from those who may have discovered the right treatment it requires. It is not uncommon to see trees, apparently fruitful, either barren or producing fruit which falls off when half grown, and I consider a good crop of Figs more the result of chance than proceeding from skilful culture. What I want is, instructions whereby the Fig may be cultivated with as much certainty as the Vine. My trees, occasionally, do very well, but in some seasons indifferently, although under the same treatment. It may be said that this is a law of Nature, but such a complete failure in Grapes as may often be seen in Figs is of rare occurrence. By careful attention to the habits of the Fig, such entire failures may, perhaps, be rendered less common than they are at present. It is true that the seasons have more effect on the Fig than management, but there may be some means of neutralizing the bad effect of an unproductive season, and thereby enabling us to expect a crop with more certainty than at present. All my experience has added nothing to the already well-known methods of ringing, stopping, &c., which are known to every one. I have, however, found that the long stalks of Jerusalem Artichokes form the readiest and best covering for the trees in winter, as they can so easily be thinned out when fine weather sets in, in spring.—*R. T. G.*

Mulberries.—Colonel Davidson, in his "Travels in India," lately published, mentions four or five sorts of Mulberries—red, blue, black, yellow, and white. What are these? Only one edible kind is known in this country, I believe.—*Totty.* [Will any of our Indian friends explain this?]

Leycesteria formosa.—It is stated in the *Chronicle* that pheasants and pea-fowls eat the berries of Leycesteria formosa. I observe that blackbirds and thrushes are very fond of eating them; they also eat large quantities of Fuchsia berries, which has been the means of producing several self-sown plants about the pleasure-grounds here. —*J. Street, Beil, East Lothian.*

Mildness of the Season.—Mr. J. Street, gardener at Beil, East Lothian, states that the weather in that quarter is remarkably mild and dry, and that the birds are singing as if it was May or June. He gives the following list of plants that are flowering freely in the garden there:—China Roses, scarlet, odorata, and some hybrid ones; Stenactis, Coronilla juncea, in full bloom, also the double Primrose, Salvia fulgens, Garrya elliptica, in fine bloom, its pollen flying about when touched; likewise Tussilago fragrans, Erodium hymenodes, Helleborus niger, Chinese Privet, and tree Medick in very full flower. In the same collection are also blooming freely, Stocks, Laurestinus, Tritoma media, Strawberry tree, and Senecio lanceus. These are all in the open-ground borders. Some Carnations; Scabiosa africana, a half-shrubby plant, with flowers similar to our wild ones, but rather paler and having foliage curly or frilled, similar to curly greens, about three feet high, survives the winters here with some light leafy soil put about it in winter, and ripens seeds freely; of this he has seedling plants. Tritoma media survives the winters here with some leaf-mould put round it before severe weather; it also ripens seeds, from which he has many seedling plants; it flowered nearly all last winter, 1842, and during spring up to end of May, 1843. One plant produced upwards of 20 strong flower-stalks in various stages of growth. These have a cheerful appearance, especially when snow has covered the earth.—*J. Street, Beil, East Lothian.*——Messrs. Lane and Son, of Great Berkhampsted, have sent two Rose-blooms that had been gathered from an exposed situation in their nursery;

they were quite fresh, well coloured, and as perfect as if they had been produced in July, being the eighth month this charming tribe has been in bloom in the open air. During the next four months they will be in flower under glass, so that there is little difficulty in having them in succession throughout the whole year.—The following were blooming in the garden of G. Imms, Esq., Bowater Crescent, Woolwich, on the 20th of December, viz.:—

Sweet Scented
Pelargonium
Eutoca Wrangeliana
Erysimum Perofskianum
Virginian Stock
Forget Me Not
Mignonette
Dianthus latifolius
Brown's Moss Pink
Campanula fragilis
Phlox stolonifera
Phlox tardiflora
Nemophila atomaria
Malva fragrans
French Honeysuckle
Polyanthus
Jacobæa
Grape Hyacinths
Laurustinus
Arbutus Unedo and rubra
Lupinus polyphyllus
Myrtles
Helleborus niger
Œnothera tetraptera
Wallflowers
Stocks
Crocuses
Vinca variegata
Dwarf Cistus
Cornicle
Double Furze
Pyrus japonica
Eccremocarpus scaber
Lophospermum erubescens
Primroses
Anemones
Pansies
Sisyrinchium
Lobelia gracilis
Auriculas
Erica herbacea rubra
Erica mediterranea
Balm of Gilead
Chrysanthemums
Double Feverfew
Gentiana acaulis
Monthly Roses
Daphne cneorum
White & Single Russian Violets
Hepaticas
Mountain Pink
Cerastium maximum, and
Sweet Williams.

Another correspondent informs us that there is at Munden, the seat of N. Hubbert, Esq., near Watford, Herts, a Camellia of the old double striped variety, having four fully expanded blooms, and more ready to open. It is growing on an open wall, and except being situated near the angle of a wall with a south-west aspect, it has had no other protection from the frosts that have already visited that district.——Mr. Ross writes from *Inverness* as follows:—We were compelled last week to cut the Grass here, which was better than in September. Cauliflower-plants in front of a wall have been growing rapidly for the last five weeks. The herbaceous plants are springing fast. Stocks produced buds to flower this winter. Calampelis is in bloom next the wall. Maurandyas, Loasas, Petunias, are quite green. Rhodochiton is in flower. Cuphea serpens produced shoots two feet long recently. All the Verbenas that were left out are quite healthy, and some in flower. The congregation of the Free Church of Cawder was sitting in the open air till last week, when they got into a wooden erection, 63 ft. by 38 ft. They felt but little colder, as the oldest of them said they never saw such a mild winter.

Foreign Correspondence.

Paris, Dec., 1843.—As the subject of PINE GROWING appears just now to attract much attention in England, perhaps the result of my observations upon the culture of them in France may be of service to some of your readers, especially as I have had the opportunity of seeing the different modes of pot and open ground culture upon a large scale, in all stages and seasons, not only in Paris, Versailles, and Meudon, but also in the northern and western departments. The time was when 1½ and 2lbs. were considered a good size for a Queen, and 4lbs. for a Providence; but, thanks to the improvements in science, hot-water, and open ground culture, a new era has commenced, and the Pine-grower is effecting as great a revolution in his department as the Floricultural amateur has accomplished with Pelargoniums, Roses, or Dahlias. As the Potager, or King's Kitchen Garden, at Versailles, is the largest establishment for fruit in this country, and moreover, has the honour to have been the first in passing the rubicon of customary usages, I cannot do better than detail the mode of cultivation, and varieties most esteemed. This garden was laid out by "La Quintinie," in the time of Louis XIV., and no expense was spared to render it a worthy appendage to the palace of Versailles, which was then the residence of the gayest Court in Europe. The present distribution of the fruit-garden retains a great similarity to the plans of La Quintinie, in 1681, with the exception of the forcing department, which at that time consisted only of a few frames for Melons, Cucumbers, and small Salads. It was not till about the year 1702 that the Pine-apple was introduced into the Potager, and so little was then known of its culture, that no mention is made of any fruit having been obtained till 30 years after; in fact, this and other tropical fruits do not appear to have received much attention until the time of the Empire; since the peace still greater improvements have been made; many new houses, especially for Pines, have been erected, and the hot-water system all but entirely adopted. The honour to which it has now attained is more particularly due to M. Massey, the present director of the Royal Gardens, and to the chief-gardener in the forcing department, M. Grison, who have, within the last few years, so successfully introduced the open ground system of culture. The whole of the succession-pits and fruiting-houses are now heated by hot-water, tan has been entirely discarded; all the water-pipes are of copper,—some round, others open, gutters, 5 or 6 inches wide, by 3 deep, like those in use at the Hon. R. Clive's, at Hewell; these last are now coming into general use for bottom-heat. In England I believe almost all the pipes for warming the atmosphere are round—here, on the contrary, the greater part are flat and upright, from 6 to 8 inches high and 1 inch thick; in these the water is said to circulate quite as freely; and moreover a great advantage is gained by the comparatively short time in which any given degree of heat may be obtained, the difference being about three to five; on the contrary, however, it is lost quite as rapidly. The boilers, of which I have seen only three different models, are of copper, and of a form totally unlike those used in England; none are conical, and the makers with whom I have conversed in Paris appear to think that form no way superior to theirs. The soils used in England and France for Pines are altogether different; in almost every Pinery that I have seen in England, a strong loamy soil was predominant; at Paris, Versailles, and I understand at almost every other place in France, they are now grown in peat; some persons have tried loam and leaf-mould, others loam and peat, or common earth and black sand, but none of these composts have proved satisfactory; nevertheless, many eminent Horticulturists, and among them M. Poiteau, the editor of the "Bon Jardinier," still think that a stronger soil would be better suited to the end in view: not so, however, the actual growers; the universal opinion among them is, that pure peat is for every variety the best adapted to insure a rapid growth, which they consider so essentially necessary to obtain large fruit; and certainly the health and vigour of the plants, and the enormous fruit which has been obtained in this soil would lead you to believe their opinion well founded. The treatment of the plants when young, and indeed throughout all their stages in pots (with the exception of soil), is very much the same as in England; it is therefore to the advantages of the open-ground culture that I would direct the attention of English growers. The suckers are planted in August and September, and remain till May in pits of the lowest temperature, when frames for the summer are prepared of dung and Chesnut or Oak leaves, well mixed and sweetened, of four feet thickness, which is found to retain a steady bottom-heat of 18° to 20° of Réaumur (72° to 75° Fahr.) for a much longer time than from dung alone; upon this is a bed of peat (sometimes mixed with a few decayed leaves and black sand), about eight inches deep, in which the young plants are set at sufficient distance apart to allow for six months' growth. These frames are well protected by straw mats at night, and as the summer advances air is liberally given, and water as occasion may require. Rapid progress under this treatment is soon apparent; here they remain till the end of September or middle of October, when they are once more repotted in 24s or 16s in pure peat, and placed in the winter pits with a bottom-heat of 22° to 25° of Réaumur (82° to 88° Fahr.), while the atmosphere ranges from 15° to 17° (82° to 86° Fahr.) In the following May those which are to fruit in pots are shifted into 16s or 12s, while those for the open ground are planted in the fruiting-houses, the soil of which is pure peat 9 or 10 inches deep; the bottom-heat is now increased to 25°, and the air never below 17° or 18°; in September and October many of the plants are showing fruit, which comes to maturity in time for the Paris season, which commences in December. Such is a brief outline of the open ground system, as practised at Versailles and elsewhere. This treatment has not, however, been found equally advantageous to every kind of fruit; it is only in the Cayenne, Enville, Jamaica, Providence, and one or two other varieties, that the increase of size has been most apparent; very little difference has been perceptible in the size of the Queens (at least at the Potager) and by far the greater number of this kind are still grown in pots. There are at this time some splendid specimens of the larger kinds in the open ground, especially among the Cayenne Lis; some short time ago I noticed two magnificent fruits of this variety on two-year old plants; they were in every respect perfect models of form, and must have weighed, I think, upwards of 12 lbs. each. I measured one, which was 11½ins. long, by 8ins. wide. These are not solitary instances of the advantages of this system, for I have before seen others of equal magnitude and beauty; while fruit of the same variety in pots has not weighed more than 5lbs. or 6lbs.; similar results have attended the Envilles and Providence, of which there are some almost, if not quite, as large. These two last have been hitherto extensively grown on account of their weight; but the irregularity of form in the Enville, and secondary quality of the Providence, will now no longer permit them to retain the place they have hitherto done, neither of them being at all comparable, either in form, size, or flavour, to the Cayenne Lis, or Epineux, which are second only in delicacy of aroma to the Queen, and infinitely superior in every other respect, being without dispute the noblest Pines in cultivation. The Queens weigh, on an average, at Versailles about 3lbs., in the open ground; some few have reached 4lbs., or more; but very many have also been less than 2lbs.; those in pots have been somewhat smaller—the difference in size of this kind under the two systems has not varied more than one-fifth; while the Cayenne and Providence have increased more than one-fourth. The number cultivated in this garden is above 2,000; more than two-thirds are Queens; then follow Providence, Cayenne, Enville, and Jamaica. Many others are grown for the sake of variety, such as Antigua, Poli blanc, Moscow, Queen, &c. &c.; but the first-named sorts constitute the grand resource for the Royal family and Court. In a few days I will send another paper on this subject, and also a description of some seedling Pines, which have been lately obtained in Paris and Versailles, as well as of the different boilers now in use.

Societies.

BOTANICAL SOCIETY OF EDINBURGH.

THIS Society held its second meeting for the season on Thursday, the 14th ult.,—W. C. Trevelyan, Esq., in the chair. Mr. C. Lawson, Junior, Edinburgh, was elected a Resident Fellow. A donation of specimens, from Sierra Leone, presented by A. Gerard, Esq., was placed on the table. Professor Graham read the continuation of his botanical tour to the south of England and Jersey, in the course of which he mentioned the various plants observed, so far as peculiar to those districts, or only of rare occurrence in Scotland. He was rather surprised to notice species growing in considerable quantity that have, for the most part, been very sparingly supplied to the Society—a circumstance which shows the desirableness of English Botanists keeping in view, when making their annual collections, that such species, though not uncommon to them, must be always in demand among their Scotch brethren. The Professor also made some observations on the climate and general aspect of the island of Jersey, in reference to its height above the level of the sea, the nature of its soil, &c., as bearing on the vegetation. At the close of public business the meeting proceeded to the election of office-bearers for the present year, when the following gentlemen were appointed:—viz., President, Professor Graham; Vice-Presidents, Dr. Neill, David Steuart, Esq., W. C. Trevelyan, Esq., and W. H. Lowe, Esq., M.D.—*Edinburgh Evening Post.*

ENTOMOLOGICAL SOCIETY.

Jan. 1.—G. Newport, Esq., in the chair. A new part of the Transactions of this Society was announced and laid upon the table. A list of officers for the ensuing year was read over. Mr. Ingpen exhibited a birds' nest, apparently belonging to the hedge-sparrow, which had been built during the past month. An extract was read of a letter from Mr. Fortnum, of Adelaide, in South Australia, to the Rev. F. W. Hope. He had obtained a Phasma, with one of its legs broken off, and he had fed it on the leaves of the Gum-tree, and on shedding its skin, in the place of the leg which was broken off a new one, but very small and imperfect, had made its appearance. At the second time of shedding the skin the leg was much larger, till at last, after four sheddings, it assumed a natural size. A remarkable fact in the habits of Phasmidæ is, that the moment they are out of their old skin they commence eating it. Mr. Fortnum had captured at Adelaide three species of Mantispa, and also of Ascalaphus. He had found no Necrophaga. A communication was read from Dr. Thomas Savage, in which he stated that he had discovered in tropical Africa a new species of Mecynorhina, very closely allied to M. polyphemus. An extract of a letter from Colonel Hearsey to Mr. Westwood, from central India, was read. He had taken abundance of Diopsis, the double-headed fly, at different times and in different places. Mr. Westwood described two new species of sacred Beetle, for which he proposed the name Ketocerus. They are most nearly allied to the genus Heleo-cantharis. The President referred to M. Fortnum's remarks on the reproduction of the legs of Phasma. He had found that the Myriapods possessed the same power of reproduction, and he had seen the legs and antennæ of the Julus and Lithobius both reproduced. This reproduction did not take place when the animals had ceased to grow. He did not consider Swammerdam's theory of the developement of one skin or skeleton within another at all borne out by the facts of the case. Mr. Waterhouse thought that the constant reproduction of the parts in Crustaceous animals was accounted for by the fact that they never came to maturity. There was not a period, as in insects, when they ceased to enlarge and throw off their skins. Other remarks were made by Messrs. Yarrell, Marshall, Westwood, and others.

Reviews.

Lessons on Animals, Vegetables, and Minerals. By Mrs. Marcet. 12mo. Longmans.

THIS is a trifle, produced with the skill which its authoress is well known to possess; but only suited to the very youngest of children. It is, in fact, in some respects, an anticipation of the knowledge which the ordinary events of a child's life are sure to produce, unless very extraordinary means of obstructing knowledge are resorted to.

That the admirable arrangements of the creation are far beyond the comprehension of man, is only denied by those who are ignorant of the extent of their own ignorance. Nevertheless, we are no great admirers of the forced construction placed by some people upon very common facts. We should have thought that so clever a person as Mrs. Marcet would be above all *ad captandum* speculations; and yet we are reluctantly obliged to inquire what else is the following:—

"There is an umbrella over the stem of every tree to prevent the rain from wetting it.

"The children laughed and wondered what the teacher meant. He then showed them the print of an Oak, saying, look at the head of this tree; is it not very much in the shape of an umbrella? and it answers the purpose of one completely, for it prevents the trunk of the tree from being wetted. You see how good God was when he made the trees, to give them such a shape that the rain cannot reach the stems to rot them."

Surely we need not add that this is entirely wrong; and that the office of the head of a tree is anything rather than to prevent water falling on the trunk and wetting it. If it were really as Mrs. Marcet states, what would become of all the unfortunate trees pruned to the form of whip-handles, with which suburban and other villages abound?

NOTICES OF NEW PLANTS WHICH ARE EITHER USEFUL OR ORNAMENTAL.

CATTLEYA MARGINATA. White-bordered flowered Cattleya. (*Stove Epiphyte.*) Orchidaceæ. Gynandria. Monandria.—This plant is a perfect gem of its class, and becomes additionally interesting from the circumstance of its adaptation to the purposes of the cultivator in a picturesque point of view; as it may be grown on a log of wood, and suspended from the roof of the hot-house. It is one of the many treasures in the collection of Messrs. Loddiges, of Hackney, and was imported by them

gentleman from Brazil. It blossomed in their Orchidaceous house during the month of October last. In its dwarfness, it comes near C. pumila, another lovely species, which is too little cultivated. The flowers are very large, compared with the size of the plant, and are borne singly on the top of the fresh pseudo-bulbs. They assume a drooping character, which greatly improves their effect when the plant is suspended. The sepals and petals are of that delicate rosy crimson which is found in several species, and the handsome lip is much like that of C. labiata; but the last organ has a beautiful white border, which is the peculiar characteristic of the plant, and certainly renders it very attractive. Altogether, this is one of the most pleasing of Orchidaceæ, and well exhibits their remarkable peculiarities. Nothing could be more fascinating in a drawing-room, than a few plants such as this, in full flower, hung from the ceiling: the block of wood to which they are fastened being half concealed by moss. Not requiring a very high temperature, it is also singularly fitted for such an object. To grow it nicely, it should be fastened to an old log of wood, and kept in a cool house during the winter. The cooler part of the Orchidaceous-house, where it will not get too much moisture, will likewise suit it best in summer. It may be grown in a pot, if desired; but this system is not so completely in accordance with its habits.—*Paxton's Magazine of Botany.*

TRIPTILION SPINOSUM. Spiny Triptilion. (*Herbaceous Perennial.*) Compositæ. Syngenesia. Æqualis.—There is a striking beauty about the vivid blue tint of the blossoms of Triptilion spinosum, which must always render it an object on which it is delightful to gaze; and the extreme neatness of these flowers, with their copious production in dense heads, is another characteristic which adds to its effect. Writing of it in the "Botanical Register," Dr. Lindley remarks that "it is a native of Chile, where it appears to be exceedingly common, and is called Semperviva, on account of the permanence of its deep azure flowers. It has long been known to botanists conversant with the Chilian Flora as a most desirable species to introduce, and repeated attempts have been made to secure it, but in vain, until seeds came into the hands of Mr. Frost, gardener to the Countess of Grenville, at Dropmore." Mr. Frost has been very successful in rearing it; but the specimens exhibited by him at the Chiswick Gardens have not been free from that brownness in the lower leaves, and that partially unhealthy aspect, which are too common to the species. It flowered well last autumn with Mr. Glendinning, of the Turnham-green Nursery. He writes us respecting it as follows:—"Its scarcity in collections is attributable to three causes; viz., the sparing way in which it has hitherto been increased, the want of the true desideratum of culture, and the great difficulty attending its preservation during winter. I perpetuate it by division of the roots. This means of increasing it, however, is a very sparing one. It should be divided early in the autumn, that the plants may be established before the damp days arrive. It must not from this be inferred that the plant is tender. On the contrary, it will resist considerable intensity of frost without injury. It will produce seeds, although not freely. A plant here has afforded me a little seed; and I have now plants obtained by both modes of increase. The seeds should be sown immediately when gathered, in light sandy soil, and placed in a warm house. When sufficiently advanced, the plants should be potted singly in small sixties, and kept in a dry part of the greenhouse during winter." The great point in growing the plant is evidently to preserve it from superfluous dampness. To aid in effecting this, the heath-mould in which it is potted should be particularly fibrous and open, and have a little turfy loam and leaf-mould mixed with it, besides a small quantity of broken sandstone. The three divisions of the pappus of the flower have originated the generic name, which is from *treis*, three, and *ptilon*, a feather.—*Paxton's Magazine of Botany.*

ACHIMENES PEDUNCULATA. Long peduncled-flowered Achimenes. (*Stove Perennial.*) Gesneraceæ. Didynamia Angiospermia. The soft and exquisite light purple of the blossoms in A. longiflora, and the glowing crimsony scarlet of A. coccinea, have here a worthy companion in the deep vermilion and orange of A. pedunculata; which is likewise a species so peculiar in habit, that it presents a fine change from the others. It was found by Mr. Hartweg, the collector for the Horticultural Society, in the shady woods of Santa Maria, Guatemala, and sent to the Society's garden at the same time as A. longiflora and A. rosea. One of its chief recommendations is, that it continues to flower late in the season, specimens were blooming freely in the nursery of Mr. Mountjoy, Ealing, in October last. Being of a strong erect habitude, it grows to the height of eighteen inches or two feet, and bears its handsome blossoms towards the top of the stem, on long axillary peduncles, which have usually two flowers on each. Their colour is a dark vermillion, with a light orange-coloured throat, and dark stripes in it extending nearly across the segments of the limb. Curious little bulb-like tubers are formed on the upper part of the peduncles, along with minute leaves. To have this Achimenes in high perfection, it should be grown rapidly when it begins to start. A warm moist atmosphere will best accomplish that object; and if these conditions be supplied through the medium of bottom-heat, they will be all the more congenial. A moderately rich loamy soil is requisite. Throughout the winter the plant will remain in a state of rest; but it does not lose its stems so early as some of its allies, and consequently requires to be watered with caution in the autumn. We presume that, like the rest of the species, it produces tubers in abundance from its roots, and that by these it may be readily propagated. From the rich colours of its flowers, it offers a good occasion to the hybridist for blending with such species as A. grandiflora or rosea. Indeed, with the former, its own blossoms would be improved in size: while A. rosea would be altogether ameliorated by the intertusion of its hues.—*Paxton's Magazine of Botany.*

CLEMATIS MONTANA. Var. grandiflora. Mountain Virgin's Bower. Large-flowered variety. (*Hardy Climber.*) Ranunculaceæ. Polyandria Polygynia.—This handsome variety of the very fragrant Clematis montana flowered in the open ground, in the garden of Mr. Veitch, of Exeter, at the same time with the ordinary form of the plant, of which the blossoms are not half so large. Both are well worth cultivating in gardens where there is accommodation for climbers. The profusion of large flowers, the delicacy of their colour, and their fragrance, are strong recommendations. The species is a native of Northern India: Dr. Buchanan Hamilton collected it at Chitlow, in the Valley of Nepal, flowering in April. Mr. Blinkworth gathered it in Kamaon, and Dr. Royle notices it as prevalent in the Himalayan Mountains, at an elevation of from 5,000 to 7,000 feet above the level of the sea. In our country it flowers in early summer, and indeed, through the month of September. In a few years it ought to become a very general plant, for it strikes readily from cuttings and from layers.—*Curtis's Botanical Magazine.*

THE NATURALIST'S CORNER.

73. *Chocolate.*—Cacao-beans, from which chocolate is made, and which, prepared in lumps or cakes, or in powder, is sold in the shops under the name of cocoa, are the seeds of the *Theobroma Cacao* of botanists. This tree grows to the height of 15 or 16 feet. The fruit resembles a Cucumber, and is commonly about three inches in diameter. It is smooth on the outside, and has a yellowish red colour. The seeds are known to be ripe by their rattling when the capsule is shaken. The Cacao-tree bears leaves, flowers, and fruit, all the year through. It is a native of the tropical regions of America, where it is largely cultivated, as well as in many of the West India islands. From time immemorial the seeds have been employed as money in some parts of America. Chocolate seems to have been first manufactured in Mexico, and the Creole ladies were for a long time so fond of the beverage, that it was habitually served to them even in church by their slaves.

74. *Mallows.*—Among the very numerous species of *Malvaceæ*, several are of essential service to man. As emollients they are well known in medical practice; the Marsh-mallow (*Althæa officinalis*) being one of the most useful among this kind of remedial substances, and a large proportion of the whole order being capable of supplying its place. The hairy covering of the seeds of the various species of *Gossypium* forms the raw cotton, so important to our manufacturers. *Malva tricuspidata* is used by the negroes in the West Indies as a substitute for soap. The seeds of *Hibiscus abelmoschus* are warm and musky, and are employed in perfumery as a substitute for musk; those of *Hibiscus esculentus* form the ochra, so much used in hot countries as a mucilaginous ingredient in soups. A few species are acid, especially *Hibiscus sabdariffa*. Finally, the tenacious fibres procured from the inner bark of many kinds of malvaceous plants, form a good description of cordage. *Hibiscus elatus* and *tiliaceus*, and several kinds of *Sida*, are principally used for this purpose.

Miscellaneous.

Mr. Loudon.—Mr. Loudon's father was a farmer, residing in the neighbourhood of Edinburgh, where he was very highly respected; but Mr. Loudon was born on April 8th, 1783, at Cambuslang, in Lanarkshire, where his mother's only sister resided, herself the mother of the Rev. Dr. Claudius Buchanan, afterwards celebrated for his philanthropic labours in India. Dr. Buchanan was several years older than Mr. Loudon, but there was a singular coincidence in many points of their history. The two sisters were, in both cases, left widows at an early age, with large families, which were brought up by the exertions of the eldest sons; and both mothers had the happiness of seeing their eldest sons become celebrated. Mr. Loudon was brought up as a landscape-gardener, and began to practise in 1808, when he came to England with numerous letters of introduction to some of the first landed proprietors in the kingdom. He afterwards took a large farm in Oxfordshire, where he resided in 1809. In the years 1813-14-15, he made the tour of Northern Europe, traversing Sweden, Russia, Poland, and Austria; in 1819 he travelled through Italy, and in 1828 through France and Germany. Mr. Loudon's career as an author began in 1803, when he was only 20 years old, and it continued with very little interruption during the space of forty years, being only concluded by his death. The first works he published were the following:—"Observations on laying out Public Squares," in 1803, and on "Plantations," in 1804; a "Treatise on Hothouses," in 1805, and on "Country Residences," in 1806, both 4to.; "Hints on the Formation of Gardens," in 1812; and three works on "Hothouses," in 1817 and 1818. In 1822 appeared the first edition of the "Encyclopædia of Gardening;" a work remarkable for the immense mass of useful matter which it contained, and for the then unusual circumstance of a great quantity of woodcuts being mingled with the text: this book obtained an extraordinary sale, and fully established his fame as an author. Soon after was published an anonymous work, written either partly or entirely by Mr. Loudon, called the "Greenhouse Companion;" and shortly afterwards "Observations on laying out Farms," in folio, with his name. In 1824, a second edition of the "Encyclopædia of Gardening" was published, with very great alterations and improvements; and the following year appeared the first edition of the "Encyclopædia of Agriculture." In 1826 the "Gardeners' Magazine was commenced, being the first periodical ever devoted exclusively to Horticultural subjects. The "Magazine of Natural History," also the first of its kind, was begun in 1828. Mr. Loudon was now occupied in the preparation of the "Encyclopædia of Plants, which was published early in 1829, and was speedily followed by the "Hortus Britannicus." In 1830, a second and nearly re-written edition of the "Encyclopædia of Agriculture was published, and this was followed by an entirely re-written edition of the "Encyclopædia of Gardening," in 1831; and the "Encyclopædia of Cottage, Farm, and Villa Architecture," the first he published on his own account, in 1833. This last work was one of the most successful, because it was one of the most useful, he ever wrote, and it is likely long to continue a standard book on the subjects of which it treats. Mr. Loudon now began to prepare his great and ruinous work, the "Arboretum Britannicum," the anxieties attendant on which were, undoubtedly, the primary cause of that decay of constitution which terminated in his death. This work was not, however, completed till 1838, and in the meantime he began the "Architectural Magazine," the first periodical devoted exclusively to architecture. The labour he undertook at this time was almost incredible. He had four periodicals, viz., the "Gardeners'," "Natural History," and "Architectural Magazines," and the "Arboretum Britannicum," which was published in monthly numbers, going on at the same time; and, to produce these at the proper times, he literally worked night and day. Immediately on the conclusion of the "Arboretum Britannicum," he began the "Suburban Gardener," which was also published in 1838, as was the "Hortus Lignosus Londinensis;" and in 1839 appeared his edition of Repton's "Landscape-Gardening." In 1840, he accepted the editorship of the "Gardeners' Gazette," which he retained till November, 1841; and in 1842 he published his "Encyclopædia of Trees and Shrubs." In the same year he completed his "Suburban Horticulturist;" and finally, in 1843, he published his work on "Cemeteries," the last separate work he ever wrote. In this list, many minor productions of Mr. Loudon's pen have necessarily been omitted; but it may be mentioned, that he contributed to the "Encyclopædia Britannica," and Brande's "Dictionary of Science;" and that he published numerous supplements, from time to time, to his various works. No man, perhaps, has ever written so much, under such adverse circumstances, as Mr. Loudon. Many years ago, when he came first to England (in 1803), he had a severe attack of inflammatory rheumatism, which disabled him for two years, and ended in an anchylosed knee, and a contracted left arm. In the year 1820, whilst compiling the "Encyclopædia of Gardening," he had another severe attack of rheumatism; and, the following year, being recommended to go to Brighton to get shampooed in Mahomet's baths, his right arm was there broken near the shoulder, and it never properly united. Notwithstanding this, he continued to write with his right hand till 1825, when the arm was broken a second time, and he was then obliged to have it amputated; but not before a general breaking up of the frame had commenced, and the thumb and two fingers of the left hand had been rendered useless. He afterwards suffered frequently from ill health, till his constitution was finally undermined by the anxiety attending on that most costly and laborious of all his works, the "Arboretum Britannicum," which has, unfortunately, not yet paid itself. He died at last of disease of the lungs, after suffering severely about three months; and he retained all the clearness and energy of his mind to the last. His labours as a landscape-gardener are too numerous to be detailed here, but that which he always considered as the most important, was the laying out of the Arboretum so nobly presented by Joseph Strutt, Esq., to the town of Derby. Never, perhaps, did any man possess more energy and determination than Mr. Loudon; whatever he began he pursued with enthusiasm, and carried out, notwithstanding obstacles that would have discouraged any ordinary person. He was a warm friend, and most kind and affectionate in all his relations of son, husband, father, and brother; and he never hesitated to sacrifice pecuniary considerations to what he considered his duty. That he was always most anxious to promote the welfare of gardeners, the volumes of this Magazine bear ample witness; and he laboured not only to improve their professional knowledge, and to increase their temporal comforts, but to raise their moral and intellectual character.—*From the Gardeners' Magazine*—which, we regret to say, has been finally discontinued, after a useful existence of 18 years.

Cæsalpinia coriacea.—The seeds of a plant were exhibited on the 7th of Dec. at the Royal Society of Horticulture, Paris, under the name of Cæsalpinia coriacea, but it was an error, for they were the seeds of C. coriaria, which are used in America for tanning. I examined them in the hothouses at Neuilly and elsewhere, where the seeds of this tree grow in the tan-bed. It is a remarkable fact, that the tannic acid produced by tan permits this tree to grow, whilst in its fresh state it destroys the embryo of many vegetables. The tanning principle lies in the sides of the pods and not in the seeds.—*Pépin.*

CALENDAR OF OPERATIONS

For the ensuing Week.

THE Gardening Directions in this Paper have been hitherto entrusted annually to some one Gardener of known skill and reputation; and we hope our readers will agree with us in thinking that the manner in which Mr. Paxton, in the first instance, and subsequently Messrs. Whiting and Beaton, fulfilled their task, was worthy of all praise. It has, however, been found that a weekly duty of this nature presses too heavily upon any man diligently engaged in the business of a Gardener; and, moreover, no one person, however great his talent, can be supposed to understand all branches of cultivation equally well. We have, therefore, decided upon altering our plan, so far as to confide the important duty of conveying weekly instruction or advice to gardeners all over the United Kingdom, to some of the most intelligent persons of our acquaintance; and by this means we trust to render the Calendar all that it is possible that it should be. We may be expected to state who the authorities are, whom we have been so fortunate as to secure. We must, however, decline affording the curious any information upon that point, for the following reason. The labour of writing the Calendar is in itself very considerable; but when, in addition, the writer is exposed to endless questions, upon all kinds of subjects from unknown correspondents, the trouble is increased beyond endurance; and, in fact, we do not feel justified in asking any one to be exposed to it. This we conceive will sufficiently explain our motive for concealing the names of our Calendarial friends.

I.—HOTHOUSES, CONSERVATORIES, &c.

THE temperature of the stoves should not exceed 60° now by fire-heat, and a fall of 10° may be allowed at night in very cold weather. Although all plants now at rest should be kept comparatively dry, they will require to be looked over daily, to see that they do not suffer for want of water, particularly those nearest the pipes and flues. Orchidaceæ may be potted, tied up to logs, or fitted into wire baskets at any time when little can be done in the open air, but they need not be watered or enticed to grow for a long time.

Conservatory.—Of all plant houses this requires the smallest quantity of air in winter. I have seen Conservatories where plants thrived very well that did not receive air by the ventilators for weeks together. In order to keep down dust—so injurious to plants in winter—the paths should not be swept when they are quite dry. Gardeners are often compelled to make use of the engine, even in winter, to clean the leaves. Very little watering will do here now, and that should be nine or ten degrees warmer

than the mean temperature of the house, which may be about 45°.

Greenhouse.—The temperature of this house should not be raised much above 40° now; the watering ought to be finished early in the day, and the plants should be constantly looked over to keep them free from dead leaves, insects, or soddened mould in the pots.

Cold Pits.—A multitude of half-hardy plants may be kept in these without any means of artificial heating; but at the outset, notwithstanding all care, some of them may be lost; deaths, however, will cease in the best plant-houses.

Forced Flowers.—As I proceed I shall have a good deal to say under this head. I shall only now remark that where forced flowers are in great request two divisions are necessary—one for such hardy plants as do not succeed in a high temperature, the other with means for bottom-heat, for Gardenias and other stove plants. Almost all plants, however, in forcing, are benefitted by a mild bottom-heat.—*D. B.*

II.—FLOWER-GARDEN AND SHRUBBERIES.

Out-door Department.

After the late frost and snow, but little can be done here at present, except where alterations are going on, and then the trenching of ground for planting may be proceeded with; but it will be advisable to keep the frozen or snow-saturated surface soil at the top, as, if thrown into the bottom of the trenches, it will remain cold for a long time. Keep the walks and Grass as neat and clean as possible, to compensate a little for the want of flowers at this dull season.

Reserve Garden.—Beds containing autumn-sown Annuals would be the better for a few branches of evergreens stuck into them, to shade the plants from bright sunshine after frost, and to protect them from drying winds. Plants generally in the open air are tender this season, and must be watched accordingly.

Pits and Frames.—The young stock of plants in these structures are in a growing state, and therefore will require to be securely guarded against frost; but give them all the air and light possible on fine days, and keep them free from decayed leaves and moisture. Where Hydrangeas are required to turn into the beds in the flower-garden in April and May, they must now be put into the forcing-house. Get dung prepared, to form a propagating bed next month.—*W. P. A.*

III.—FLORISTS' FLOWERS.

As this matter does not press, we defer this part of our Calendar for the present.

IV.—PINERIES, VINERIES, &c.

Pinery.—In undertaking to write this department of the Calendar, I feel that I can advance little that will be of service to those who possess the former Numbers of the *Chronicle*, or to many practical gardeners, but if what I may say from time to time will be of use to the less experienced, it will afford me much pleasure. Perhaps there never was a time when more interest was felt in the cultivation of the Pine-apple, than at present; or when the spirit of competition ran higher among cultivators generally, than it is likely to do during the coming season. If the fruiting-pit is kept at 60° by night it will be sufficient, raising it 5° or 10° by day, according to the clearness of the atmosphere. Take every favourable opportunity of admitting air, water sparingly with a fine rose pot; it is scarcely safe to use a coarse rose at this season. Keep a moist atmosphere, but be careful that steam is never of so great a density as to settle on the leaves, and run into the hearts of the plants, or into the soil in the pot. Maintain a steady heat of 80° in the tan, or soil if the Pines are planted out. The young stock should not have more heat than is sufficient to keep them from going to rest; 57° by night is quite high enough during this month. The bottom heat for the young succession plants may be kept about 70°. Keep a less moist atmosphere during this month, and admit fresh air on all favourable occasions.

Vinery.—Where the Vines are shewing, keep a heat of 55° to 60° by night and raise the heat in the morning 5 or 10 degrees. Admit fresh air during sunshine, which can be more safely done by opening each ventilator at the top of the house a little, than by one or two. Where the Vines are now being started 45° to 50° will do for the first fortnight or a fortnight, and if fermenting material can be conveniently used it will be beneficial to the Vines. In whatever way the heat is applied be sure to keep a moist atmosphere. If any of last year's shoots have been kept of a considerable length, endeavour to get all the buds to break regularly by bending them so as to place the lowest buds in the most favourable position for receiving the best supply of the rising sap. Cover the outside borders, if the roots extend into them, with litter and leaves, and of a sufficient thickness to cause a gentle heat to enter the border.

Peach-house.—If the buds are swelling, 50° by night may be maintained, sprinkle the trees frequently, and protect the roots from the effects of frost, which is likely from present appearances to be severe. It is an excellent plan to have a stock of Peach trees in pots or tubs for the first early crop. If these are in bloom, it will be well to assist the setting of the fruit by means of a camel-hair pencil. Trees in bloom require a temperature of 57° by night and a rise of 5° or 10° by day with fire-heat, according to the state of the atmosphere.

Fig-house.—The directions for the Peach-house will apply to this. If there are some good plants in pots promising to be productive, they may be placed in the Vinery or Peach-house if there is room for them. Put pans under the pots or plunge them in tan or leaves.

Strawberries.—Now is a good time to bring some pots of the strongest plants into a pit or frame, where there is the means of supplying a gentle heat of 45° to 50°, giving plenty of air whenever the air is mild. Stir the surface of the soil in the pots, and top-dress with some well decayed manure and fragments of charcoal. See that the holes in the bottoms of the pots are not stopped up.

Melons.—Those who wish to have ripe Melons in May should sow seed of an early kind.—*G. F.*

V.—HARDY FRUIT AND KITCHEN GARDEN.

The mild weather, up to the beginning of the year, has afforded favourable opportunities for performing all out-door operations. All unoccupied ground ought to have been turned up by rough digging, trenching, or ridging, regulating these operations according to the character of the soil, and the nature of preceding and contemplated future crops. Slugs and snails were becoming rather troublesome, but John Frost will now take care of them for a little, only he must be prevented from nibbling up forward Lettuces, &c. in a more wholesale way. Keep a sharp look-out after Cauliflower plants under hand-lights, and those fit for use, as well as Lettuces, Endive, and Radishes, in cold frames, or turf-pits, protecting those in the latter with straw, or reed covers neatly made, or with hurdles thatched with straw, or Spruce-branches. Protect by throwing any loose litter over Artichokes, Asparagus, Seakale, and Rhubarb; not that the three latter will be injured by frost, but they will come in much earlier if the ground is not cooled to a low temperature. If not already done, seize the earliest opportunity of mild weather to sow the first crop of Peas and Beans, choosing for the main crop established early varieties, and only small quantities of those sorts the superiority of which is not sufficiently tested. Defend Celery from frost; it will keep good for a considerable time if taken up with balls, placed upright in rows in a shed, and clean dry straw put between the rows, so as the heads do not touch each other. Examine and defend all stored roots and fruits.

We have seldom had better weather for pruning, nailing, and planting. It is always advisable to get as forward as possible with these operations before Christmas. Protect young newly-planted trees by mulching. The wood of Peach-trees will not be over well ripened this season in unfavourable situations, and more especially in the case of those trees that suffered greatly from frost last February and March. The present frost, by checking vegetation, may help to ward off such another disaster. All the young shoots of Peaches (and Apricots) should have been unnailed some time ago. The free exposure of them on all sides would render them better hardened, and from not being contiguous to the wall, they would not be so easily excited, nor in so much danger of having their sap-vessels burst by severe frosts. In addition to this, the stems might be bound round, not over closely, with hard twisted straw-bands, and a little long litter thrown over the border to the width of four or five feet. This is a fine opportunity for moving soil, turning composts, and wheeling manure. Do not forget to give a little of the latter as a mulching or top-dressing to your Strawberry-beds, if you want to have very superior fruit next season.—*R. J.*

VI.—ARBORICULTURE.

Old Woods.—The felling of timber-trees not designed for peeling the bark should be forwarded at all convenient times. Filling up vacant spaces, when the weather permits, with young plants suitable to the soil, locality, and demand, should be proceeded with.

Coppice.—Put forward the cutting of the undergrowth for corf-rods, sheep-hurdles, watling, hop-poles, hoops for barrels, and any other purposes required; but if a vigorous aftergrowth is wished, I would prefer leaving such work till February, March, or April, for reasons I may give at a future time. Clear cut open drains, and make fresh ones where wanted: this work might be done in frosty weather. Fill up open spaces with young plants suitable to the soil—this should always be attended to.

Young Plantations.—Make new ones. Trench the ground, where a speedy growth is desired for immediate effect, for blinds or shelter, especially when large plants are used. In plantations advanced in growth, begin to thin out some of the supernumerary and inferior kinds when they begin to crowd each other, or, rather, shorten the side-branches of those intended to be taken out, for a few years beforehand.

Hedge-row Trees.—Now is the time to plant properly-prepared plants of select kinds; and as winter and spring is the season for pleaching and regulating hedges, great care should be taken to preserve what young trees there may be of the proper kinds that often naturally spring up in them, and to plant fresh ones where required. Care should be taken not to divest them of all their lateral side-branches—only the largest; and always preserve one upright leader.

Nursery Work.—I intend to confine my remarks chiefly to Nurseries of private individuals.—Make Nurseries where required. Trench the ground for planting out in rows seedling forest-trees, (either raised privately or purchased from public Nurserymen,) and for sowing seeds, nuts, or berries of the commonest kinds of plants—such as Hollies, Haws, Acorns, Spanish Chesnuts, Walnuts, and any others desired. Protect young plants from the depredations of hares and rabbits, if you can;—in some future Number I will say how, on a limited scale.—*W. B.*

VII.—COTTAGERS' GARDENS.

The unusual mildness of the season until within the last few days will have enabled the Cottager to be pretty well forward with his operations in the garden, and he will now have little to do in the way of digging, &c. for some time. As we may, however, yet expect to have some severe weather, any plants, such as China Roses, that are rather tender, should be protected, for having been somewhat excited by the late fine weather, frost will have more effect upon them, and might prove very injurious. Any hardy creeper on the cottage, as a Clematis, if not previously done, may now be neatly trained. Plants in pots, such as Pelargoniums or Fuchsias, should have an abundance of air given them every fine day; they should be watered sparingly, and this should always be done at this season in the morning.

Vegetables.—Marshall's dwarf Prolific and Mazagan Beans are the kinds generally used for early crops; the latter is the hardiest, and if not done before this, some may be sown for an early crop as soon as the weather will allow, in shallow drills about 18 inches apart, on a warm border. They may be planted in the row about three inches apart, and covered about two inches deep. On the first fine day a sowing of the Early Frame or Charlton Peas may be made, on a warm sheltered border, which should have been ridged crosswise: draw the drills within three inches of the bottom on the south side of the ridge; this will keep the seeds dry, and prevent them from rotting, as sometimes happens, especially in a retentive or clayey soil. For this crop the seeds should be sown pretty thick, and in case of intense frost they should be protected by Fern or Furze; some of the latter chopped may be put in the drills to prevent the ravages of mice.

Fruit.—Any fruit-trees trained against a wall may now be pruned, have their shoots nailed quite straight, and disposed so as to cover the wall equally. Standards may also now be pruned, taking care to cut out all cross branches. Gooseberries and Currants, if not previously pruned, may now be done, so as to allow the ground to be dug amongst them.

Flowers.—Bulbs, if any, such as Daffodils, Anemones, or Tulips, if not already planted, the earliest opportunity should be embraced for getting them in. Those planted in October will now be above ground; they should be covered with Fern to keep them from frost. Every unsightly object should be removed from the flower-borders, so as to give them a neat appearance.—*Mc. H.*

State of the Weather near London for the week ending Jan. 4, 1844, as observed at the Horticultural Garden, Chiswick.

Dec. 27. Thickly overcast; hazy throughout.
28. Fine; densely clouded; rain at night.
31. Cloudy and fine; cloudy with rain at night.
Jan. 1. Snow and sleet, commencing half-past 7, continuing till 11, A.M.; cloudy fine in afternoon, clear and frosty.
2. Slightly overcast; very clear; severe frost at night.
3. Severe frost, overcast; rain at night.
4. Hazy and mild, evening cloudy, with low fog.
Mean temperature of the week 1° above the average.

State of the Weather at Chiswick during the last 18 years, for the ensuing Week ending January 13, 1844.

The highest temperature during the above period occurred on the 8th, 1827—thermometer 59°; and the lowest on the 8th, 1841—thermometer 6°.

Notices to Correspondents.

ACHIMENES GRANDIFLORA.—*A Subscriber.*—You could not have adopted a better method to preserve the tubers of your Achimenes grandiflora. When you wish to start them, place them in a stove and give them a little water.§

BIGNONIA VENUSTA.—*Argo.*—Bignonia venusta has a season of growth and another of rest. If pruned while growing it will encourage the growth of young shoots, and prevent the formation of flower-buds; consequently it is best to shorten its shoots in winter, when in a state of rest.§

CAMELLIAS.—*W. C.*—Camellias, after they have done flowering, should be shifted, if they require it, and put into heat. A good time to march them is the latter end of March or April. Charcoal may be used with advantage in their cultivation; it should be applied in the proportion of one part of this to three of soil. Melons may be grown in pots, similar to Cucumbers. An article on their culture will appear in our columns soon.‡

CHARCOAL.—*Bellaer.*—We apprehend that charcoal will be found useful to all plants without exception; but experiments are required to prove this. Small coke will probably act in a similar way, but not so well. Breeze steeped in gas-water may also be expected to be advantageous, but we have not heard of its being used in that form. In most cases it will be advisable not to use these carbonaceous materials with less than two-thirds their bulk of soil. We should be much obliged by the papers so kindly offered.

CUCUMBERS.—*M. D.*—In growing Cucumbers you ought not to have less than 15 inches depth of soil over your hot-water tanks. You will probably find it better to change your present arrangement for heating, and employ a small boiler; a very small one will answer your purpose, and will enable you to regulate the heat to a greater nicety.‖

EVERGREENS.—*M.*—Among your trees that are thin, and from neglect have lost their under branches, you may plant the following evergreens, viz.:—Common and Portugal Laurels, Privet, Box, Hollies, and Leycesteria formosa. The common Laurels may be pegged down, so as to cover the surface of the ground. We have seen Portugals and Hollies trained up to single stems, and allowed room to form handsome heads. Managed in this way they had a neat effect.‡

FORMS OF LEAVES.—*One who has turned over many leaves to little purpose* must, we fear, be contented to do so, unless he can alter the constitution of his mind. What folly to inquire *why* Providence has made each leaf true to its form, after its kind. The "natural agency" by means of which such things happen are not revealed to beings lower than the Almighty.

GESNERA DOUGLASII.—*Argo.*—The roots of Gesnera Douglasii, although kept dry, rot off in winter, from various causes. Most probably yours had been attacked by small white insects, like Thrips, which often make great havoc, if not perceived in time; or they might have received a sudden check after flowering before the leaves had performed their functions.§

HEATING.—*W. W. P.*—We confess we think your plan of connecting gutters with the boiler very inferior to that described at p. 659.

LANDSCAPE GARDENING.—*Y. Z.*—We regret to find ourselves unable to assist you. But it is so impossible to give, in a newspaper, directions for laying out gardens, that we must decline even making the attempt. You should consult some professional man who can inspect the ground, without which nothing can be done.

KENNEDYA SPLENDENS.—We have at length, with the assistance of a friend, ascertained what this plant is. It was figured under its garden name in "Paxton's Magazine of Botany," vol. iii., t. 26, but not being included in "Paxton's Dictionary," or in any Botanical work, has escaped our search. As we stated, it is no Kennedya, but a Camptosema, from South Brazil, sent over originally, it is believed, by Tweedie. Mr. Bentham saw it growing under the name of Kennedya splendens in Count Salm's garden, at Prague, in 1837, but there they gave Mexico as its station, which is a mistake. It is apparently unpublished, except by Paxton; but it must be very near Hooker and Arnott's C. rubicundum. Mr. Bentham's genus Bionia will have to be united with Camptosema, and his B. bella is allied to Kennedya splendens, which must take the name of Camptosema splendens.

MANURES.—*An Irish Subscriber.*—Wood-ashes make excellent manure. Mix them with dry earth and top-dress with them; or add them to a heap of manure, they will greatly improve its quality.‡

MRS. LOUDON'S WORKS.—*K. W. W.*—There will be no Supplement to bind up with the separate volumes of the "Ladies' Flower-Garden;" the publisher of that work, Mr. Smith, preferring to wait till a sufficient number of new plants has been introduced to form a thin volume, which will serve as a Supplement to the entire work.

NAMES OF FRUITS.—*Ald. C.*—Your Apple is a handsome specimen of the Round Winter Nonesuch.‖——*Vertumnus.*—No. 1, Golden Harvey; 2, Cluster Golden Pippin: the fruits are often joined, Siamese-like, as in the specimen you sent.‖——*A. B. C.*—Your Pear, not known, is exceedingly gritty; better destroy the tree or regraft with a good sort.‖

NAMES OF PLANTS.—*Clio.*—1, Gardenia radicans; 2, Templetonia retusa; 3, Bonapartea juncea; 4, Kleinia ficoides; 5, Crassula falcata; 6, a Stapelia. We are sorry to find you in want of information like this. How in the world can you expect to keep Abutilon striatum (the easiest of all plants to grow,) in health in a small pot. It is very good-natured of it not to die outright.——*A. Y.*—As far as we can judge, your plant is really Gustavia augusta.——*J. N.*—It is impossible to say what your plant is without the flower, which we never received. It is like Diplolepis apiculata, but certainly is not it.——*A Lady's* plant seems to be Tecoma capensis.——*G. L. H.*—A Fungus, called Rhizomorpha medullaris. Its habits are unknown.——*B. W.*—Zygopetalum intermedium.

ONE-SHIFT SYSTEM.—*M. R. Y.'s* question is very long, and cannot be answered at present.

PASSIFLORA QUADRANGULARIS.—*A Subscriber.*—Passiflora quadrangularis will survive the winter in a greenhouse, but will do much better in your Vinery. You may fruit P. edulis in your Vinery, or even in your Greenhouse, in summer; P. quadrangularis, maliformis, alata, laurifolia, &c., cannot be fruited except in a stove, where they can be kept moist all the season.§

PELARGONIUMS.—*An Irish Subscriber.*—Pelargoniums, at this season of the year, should be allowed to have as much light and air as possible in fine weather, in order to prevent them from being drawn up weakly, and water should be sparingly administered. The temperature of the house should range between 40° and 45°. When the plants begin to grow away freely they should be well tied out, in order to preserve them dwarf and bushy, and they should be kept quite clear of withered leaves. About the middle of February the plants may be syringed, and this operation may be continued until they begin to show their bloom. As the season advances the supply of water should be increased, as, if this is withheld in warm weather, they lose their foliage and become naked at bottom.‡

PSIDIUM CATTLEYANUM.—*Argo.*—Psidium Cattleyanum requires to be grown in light, loamy soil; and although a greenhouse plant, it will produce much finer fruit if placed in a Vinery or intermediate stove during summer. If the branches require thinning that may be done immediately.§

RABBITS.—*A Constant Reader.*—The rabbit bazaar at Ampthill has long since been discontinued. It was found to be a complete failure. The party who commenced the bazaar was not an agent of the Duke of Devonshire. Our correspondent will find some particulars regarding the matter in one of the early volumes of the "Gardeners' Magazine."—*J. Paxton.*

ROSES.—*An Irish Subscriber.*—You may prune your Standard Roses with advantage now. The shoots should be well thinned out, and cut back to within two or three inches of the last year's wood; and all dead pieces should be cut neatly off close into the stem. This treatment will ensure a good bloom.†

RUELLIA SABINIANA.—*Argo.*—Ruellia Sabiniana, if not too old, may be cut down with safety. This operation must be done either in spring or autumn.§

WHITNEY'S COMPOSITION.—*G. W.* must give his name. Who recommended him to use calico coverings for *forcing* Cucumbers? To do so is to misapply the material.

MISCELLANEOUS.—A book is laying at the office for "Este."——*Hortensius* is thanked for his good counsel, which shall be, at least in the matter of the Index, strictly followed.——*R. M.*—The subscription, payable in advance, is 26*s.* per annum.

Shortly will be published,

BRIEF REMARKS on some subjects connected with the CHOICE of WHEAT for SEED; interesting to Farmers, Corn Factors, and Bakers.

By Sir G. S. MACKENZIE, Bart., F.R.SS.L.&E., &c.

SUTHERLAND and MARSHALL, London; M'LACHLAN & STEWART, Edinburgh.

PRACTICAL DIRECTIONS FOR THE CULTIVATION AND GENERAL MANAGEMENT OF COTTAGE ALLOTMENTS, with Plans for laying them out for five years. Agreements on Keeping Pigs, on Service, &c.; with a Form of Rules and Agreements. By CHARLES LAWRENCE, Esq., of Cirencester. A Third Edition is being printed by Messrs. MANNING and Co. of Ivy-lane, Newgate-street; by whom all orders will be supplied, which may be sent to them before the 12th of January, at 20s. per hundred copies.

The Agricultural Gazette.

SATURDAY, JANUARY 6, 1844.

It is probable that most of our readers have seen the prospectus which has for the last few weeks been published in this and other Papers advertising the addition of an *Agricultural Gazette* to the *Gardeners' Chronicle*. There is, however, a good deal connected with the fact thus advertised that perhaps may not have occurred to some of them, and we propose at present to enlarge upon one of the subjects thus suggested.

The whole business of farming naturally consists of two branches, the one of which refers to the *production* of Vegetables, Wheat, and other Grains, Turnips and other roots, Clovers, Grasses, &c.; and the other of which refers to the *conversion* of some of these into animal substances—beef, mutton, bacon, milk, wool, &c. So far from this being merely an ideal division, it is one which, in some parts of the country, actually exists; so that, in such districts, there are two distinct lines of business connected with the land—that of the farmer, who either sells his green crops on the ground, or carries them to his buildings to dispose of them there; and that of the dealer, who purchases these crops and brings his sheep and his cattle on the farm to consume them. The principles upon which these two lines of business depend for their successful prosecution, are, of course, entirely distinct, and so also, when they are separate, are the qualifications required by those who would engage in them.

Now, it is with reference to the first only of these two branches of the business of the farmer that Agriculture can be said to come in contact with Horticulture—it is in the first part of the business only that the principles upon which successful farming depends are the same as those which should regulate the practice of the gardener; and the fact of a Farmers' Paper being established by the conductors of the *Gardeners' Chronicle*—an Agricultural being thus grafted by them upon a Horticultural periodical—may be considered as an intimation of their wish to direct the attention of their readers more particularly to the details of the first branch of farming and to the principles upon which those details depend.

The attention of the Agricultural world has, indeed, been for many years past, so much—and were it not for the writings of the last year or two, we might say so exclusively—directed to questions connected with the breeding and management of live stock, that to bring forward a new periodical in addition to those which still continue to draw attention to this branch of farming would be a superfluous and perhaps an unsuccessful attempt. Our readers must not, however, understand this expression of our opinion to imply that we shall altogether neglect the important branch of farming to which we allude. The conversion of his green crops in the most profitable manner too nearly interests every good farmer to admit of this. A great deal of light, too, has been lately thrown upon this subject by Professor Liebig's exposition of its dependence upon the laws of organic chemistry and animal physiology, and to the practical application of those laws we shall frequently invite the attention of farmers. All that we wish to express is our decided opinion, that, considering the art of *cultivation* as the most important branch of farming, great good would result could we rescue it from the neglect with which, comparatively speaking, it has been hitherto treated over large districts in this country.

Before concluding, we wish to impress upon our readers what we are very sure of—that more good will result from an endeavour to concentrate, and apply the knowledge already possessed, and to diffuse an acquaintance with the modes of practice adopted by the farmers of this country under the various climates and upon the various soils by which Great Britain is distinguished, than by any attempt to establish new principles or enforce new theories of Agriculture. And thus, while we are proud to name Drs. Buckland and Daubeny, Professors Henslow and Johnston, Dr. Lyon Playfair, Mr. E. Solly, and other scientific men among the supporters of our Paper, it is with even more satisfaction that we point to the long list of practical men which graces our columns to-day, consisting as it does of many of the most experienced and successful Farmers in every part of the kingdom, who have given us assurances of their approval and co-operation. And, with them, we invite our agricultural readers to use our columns as the channel for the interchange of opinions on the numerous subjects connected with our common occupation, and through which to publish, for the benefit of all, the results of their agricultural experience.

It is said that the advantage of a Farmers' Club to its members consists in the opportunities which it offers to each, of acquainting himself with the agricultural knowledge and practices of all the others. The point of perfection in the course of usefulness on which we shall endeavour to enter will have been then only attained when all our readers shall have been thoroughly brought to consider themselves as the members of one large and active Farmers' Club, ourselves occupying the place of the organs of speech and hearing, through which they may communicate with one another.

To these general observations we have only to add, that the following are the heads under which the matter of the *Agricultural Gazette* will be arranged:—

1. LEADING ARTICLES, which will generally refer to subjects suggested by the time of the year, and the farming operations of the season.

2. ORIGINAL MATTER, in the form of special papers on Agricultural subjects, such as the cultivation of our most important plants, the management adopted in certain branches of farming—the dairy, for instance, the weeds of Agriculture, Agricultural Mechanics, the Agricultural history and present condition of certain districts, and the various sciences, such as Chemistry, Animal and Vegetable Physiology, Geology, &c., on which the success of the farmer's practice depends. Here, too, any translations which it may be deemed advisable to make from foreign works on Agriculture will be placed; and we this day give No. 1 of a series of papers from the chapter on Mineral Manures, in Sprengel's important Work on that subject.

3. HOME CORRESPONDENCE.—This will, we hope, become the most valuable section of the contents of our Paper. The conditions under which farming is carried on in this country are so various, that it is impossible for any *one* system of Agriculture to be of universal application. An Agricultural periodical, to be *generally* useful, must therefore contain information derived from sources widely spread over all parts of the kingdom. We have already received promises of contribution to this section of our Paper from many different quarters; and we doubt not that our readers, seeing its usefulness, will assist in the compilation of this common stock of Agricultural information. We shall, in our next Number, explain more fully our views upon this subject.

4. PROCEEDINGS of the English, Highland, and Irish Agricultural Societies; and of the various County Agricultural Societies, and Farmers' Clubs. We may, however, as well announce at once that we do not propose to report after-dinner speeches, except upon very special occasions.

5. REVIEWS OF AGRICULTURAL WORKS.

6. MISCELLANEOUS notices of events of general Agricultural interest, extracts from works on Farming subjects, &c.

7. NOTICES TO CORRESPONDENTS; a department of the Paper which we shall endeavour to make of real use. We engage that Agricultural queries sent to us shall receive the attention of those competent to answer them.

8. REPORTS OF THE MARKETS.—Under this head, will be given as full a statement as the farmer will in general require for his own guidance; and it will be obtained from unexceptionable authorities, whose names will, we trust, be eventually attached to the several sections of which it will consist. Mark-lane and Smithfield, the Wool-markets of Yorkshire, the Hay, Potato, Butter and Cheese, Hop, and Manure markets, will be fully reported.

So much for the proposed contents of the *Agricultural Gazette*. As to the principles which will guide us in the selection of matter, it will be sufficient to say that ALL PARTY questions are to be excluded, as well as everything at variance with that courtesy which we all owe to each other. In the execution of our task we have no small satisfaction in being able to rely upon the support of some of the most distinguished members of the leading Agricultural Societies, of some of the most eminent scientific men who are now turning their attention to Agriculture, and of many of the best practical farmers, Agricultural engineers, and Agricultural writers of the present day.

In the early part of last year, the Editor of the *Gardeners' Chronicle* alluded to a suggestion which had been thrown out on the importance of experimental co-operation among Agriculturists in the following terms:—"When a philosopher works carefully in his cabinet, acquainted accurately with the nature of all the agents spread before him, and alive to all the disturbing influences that may affect his results, he knows that one experiment is as good as a hundred, and a necessity for repeating it may not be felt; for when natural causes are exactly alike, the same effects must as surely follow them as when figures are dexterously combined by the arithmetician. But the cultivator of the soil is in a wholly different position: he has to deal with materials which, although they are called by the same name, may be really very different in their nature. He knows very little about them; a thousand circumstances unobserved by his untrained eye may exist to disturb his results, and the consequence is, that all his experiments must be varied and repeated till *a series of averages* will form a rough but sufficient check to his conclusions. We may fairly doubt whether the coarse operations of Gardening and Agriculture will ever bear to be examined in any other way; and if they would bear it, the new results of new practices will certainly fail of carrying conviction to the minds of the mass of the people, unless supported by evidence accumulated upon evidence."

Since the publication of my Letters to the Farmers of Suffolk, I have had an opportunity of conversing with several scientific men on the subject, and they have agreed with me in considering that such a scheme as that which has been suggested, if fairly carried out, would speedily lead to most important results. I have seen, by the local papers, that Mr. Nesbitt has been very effectively inviting some of the Farmers' clubs in Kent to assist in carrying out such a scheme, and he has informed me that several members of those clubs have expressed their readiness to join in any attempt which may be made. I have received a similar assurance from the neighbourhood of Saffron Walden. The Rev. E. Sidney has most diligently and efficiently been lecturing to the farmers, and others, for some time past, in the neighbourhood of Norwich, on scientific subjects bearing upon Agriculture; and, from what he tells me, I can feel no doubt that many practical men in that quarter have become capable of fully appreciating, and would bf willing to assist in carrying out, a general system oe experimental co-operation on the very easy and limited scale proposed. No doubt there are certain localities in every county where a similar disposition would be found to prevail. The real difficulty appears to lie in the properly organising some scheme for the purpose—a difficulty which, the more I think of it, the more I am satisfied is very trifling. I shall hope, as I may, to find time to occupy these pages with a few remarks upon the subject, requesting any of those correspondents who may be disposed to discuss it with me, either to state objections or to throw out suggestions, as they may see cause for doing so; in short, freely to examine a question which some persons among the best qualified for judging of its merits consider to be one of real importance to the interest of Agriculture. I have promised on this occasion to state the results of an experiment with which I have been favoured by C. Bree, Esq., of Stowmarket; and I hope it may tend to remove the scepticism of certain persons who as yet have acquired no faith in the advantages to be derived from science, and that it will assist in convincing them how possible is it for a chemical proficient, like Liebig, to make suggestions which are likely to lead to important practical results. Liebig had asserted that certain substances, as sulphuric acid, gypsum, &c., might be serviceably employed in fixing the ammonia which escapes during the putrefaction of animal and vegetable manures. Mr. Bree's experiments were directed to the verification of this assertion, so far as regards liquid manure. He filled, during the months of Feb. and March, 1843, three tubs, A B C, with 56 gallons each of human urine. Into A he poured, at intervals, 20 oz. of sulphuric acid; in B he placed 5 lbs. of burnt and 15 lbs. of unburnt gypsum; the urine in C was allowed to putrify without anything being done to it. In A, decomposition appeared to be completely arrested; in B it was protracted, but ultimately appeared to proceed as though no gypsum had been present.

Six patches of ground were measured out, each containing eight perches, and to these the manures were applied, whilst a seventh patch of $8\frac{1}{10}$ perches was left unmanured for the purpose of obtaining a comparative experiment. These patches were treated in the following manner previously to the seed being sown:—

No. I.	10 gal.	of urine	and	20	gal.	water	from tub A. (sulp. acid.)
II.	15 ,,	,,	and	15	,,	,,	
III.	10 ,,	,,	and	20	,,	,,	from tub B. (gypsum.)
IV.	15 ,,	,,	and	15	,,	,,	
V.	10 ,,	,,	and	20	,,	,,	from tub C. (nothing.)
VI.	15 ,,	,,	and	15	,,	,,	
VII.	No manure applied.						

Each patch was sown on 6th April with $13\frac{1}{2}$ pounds of Barley and Clover. No distinct difference was at first perceivable between the different crops, but the man who mowed the Barley readily pointed out the

best and worst. The Clover was *very strong* where the gypsum was used.

The following were the results obtained:—

No.			GRAIN.				STRAW.
			lbs.	B.	P.	Qrs	lbs.
I.	0 gals	A. to 20 gals. water	1[illegible]3	2	2	2½	211½
II.	15 ,,	A. to 15 ,, ,,	1[illegible]8	2	1	3½	181
III.	10 ,,	B. to 20 ,, ,,	1[illegible]½	2	0	3	146
IV.	15 ,,	B. to 15 ,, ,,	108	2	0	2½	159
V.	10 ,,	C. to 20 ,, ,,	105	2	0	1	155
VI.	15 ,,	C. to 15 ,, ,,	115	2	0	2½	188
VII.	.	. . . .	9[illegible]	1	3	2½	179

From these data Mr. Bree has made the following calculations:—

No.	PER ACRE.		WEIGHT PER COMB.			
			By Calculation.		By Chondrom.	
	qr.	lbs.	qr. b. p. qr.		qr.	lbs.
I.	109	0	13 1 0 3	14	4	15 6
II.	104	12	12 1 1 3	14	13	15 4
III.	126	6	10 3 3 0	14	3	15 3½
IV.	134	4	11 3 0 3	14	5	15 4
V.	139	0	10 1 1 0	14	9	15 4
VI.	164	4	10 3 0 3	15	4	15 4
VII.	137	2	9 2 0 3	14	8	15 4

As I am not acquainted with the Chondrometer, I know not what confidence is to be reposed in this instrument; but Mr. Bree's calculations are somewhat at variance with the results furnished to him (as above) by a practical man who examined his samples by it. It is a little remarkable that No. 3 should beat No. 1, in this description of scrutiny.

So far as they go, these interesting experiments of Mr. Bree afford good evidence for our believing in the importance ascribed to the addition of a little sulphuric acid to liquid manures; but standing alone as they at present do, they afford no data by which we may hope to elicit any very positive information respecting those fundamental *principles* upon which the science of Agriculture must depend. It will need even still closer registration of the actual results obtained, than Mr. Bree has considered to be necessary for the particular object he had in view, before any such applications of these experiments can be made; for in the present instance no account has been kept of the effect produced upon the Clover. If a cow and a horse were fed upon a given quantity of Corn, we must know how much each of them has devoured before we could safely speculate upon the effect which the whole amount had produced upon one of them. Mr. Bree's object, in this instance, has been sufficiently answered by his proving the validity of Liebig's suggestion; and it may be left to parties more directly interested in the improvement of Agriculture to co-operate in a series of experiments, to be devised, for the purpose of ascertaining whatever is really essential to their securing a just economy in practice. It will be necessary to determine to what extent the medicated urine should be diluted, and how often it should be applied, for the purpose of securing the best return at least cost. Time appears to be now an important element which farmers have to secure in these inquiries; for I see that Mr. Braude, in his late lecture to the Royal Agricultural Society, has declared it to be his opinion that the time is now arrived when Chemistry may be made serviceable to Agriculture; and there can be few chemists who are better able to form a judgment on this point than himself. But if the time is arrived, no time should be lost. What a different position will the Agricultural body be placed in at the end of six years, should the fundamental *principles* of the theory of Agriculture have become as well established as those of many of the other Industrial Arts—as dyeing for instance, and sugar-refining, and brewing, &c.—from that which they must continue to occupy if those principles shall not then have been ascertained!—*J. S. Henslow.*

MANURES.

THE labours of those Chemists who have particularly devoted themselves to the Chemistry of Vegetation may be divided into two classes, the theoretical and the practical: the former including inquiries into the higher and more abstruse departments of Organic Chemistry, whilst the latter consists chiefly of investigations into those matters which are most immediately interesting to the farmer; the former seeking to discover the philosophical laws which govern the processes of nature, the latter merely endeavouring to elucidate those laws, as far as may be necessary in order to explain practice, and lead to its improvement. Both these inquiries are of great value, though they have very different objects in view. The philosopher who busies himself in searching out those great laws of the universe, which at once exhibit the wisdom and goodness of the Creator, feels comparatively little interest in the minor details of practical experience; whilst the purely practical man, even if he have the inclination, has not time to follow the more abstruse inquiries of the former; he will naturally ask, what shall I be the better for such knowledge? and how will it benefit me?

Those who would wish to make farmers chemists, propose that which cannot be done, and which, if it could, would do more harm than good. To teach a farmer the theories of chemistry, would be to give him information which it would be totally impossible for him to apply; and on the other hand, to instruct him in what is commonly called practical chemistry would be equally useless, because if he tried to avail himself of such knowledge, he would be more likely to mislead himself, than to profit by his experiments. Farmers are taught how to analyse a soil in a simple and accurate manner, and yet all the information they could derive from such an analysis, would amount to no more than a good ploughman knows after walking across a field; nay, the result of such an analysis would probably be of far less practical value than the ploughman's opinion.

The chemistry which may benefit the farmer is neither philosophical chemistry nor the chemistry of the laboratory, but it is what may be called the chemistry of Nature. Those simple and elementary rules which affect the ordinary operations, either of Nature or art, constantly going on before us. Such knowledge is useful to every one, and, sooner or later, its value will become apparent.

Every farmer is in the habit of using manure of some kind or other; he spreads over his land something which causes the plants to grow more vigorously, and yield him larger crops than he could obtain without it. A variety of different substances are used in different parts of the country to produce this effect: what then is the substance or substances which these different manures contain—and on what does their fertilizing power depend? Setting aside, for the present, the mechanical effects which many manures produce, and which are frequently very important, let us briefly inquire what is the composition of the ordinary kinds of manure. The great bulk of manure consists of decaying vegetable and animal matter, dead plants, and a variety of substances of vegetable origin, which, as they formerly constituted living plants, must necessarily contain those matters which plants require. When these vegetable or animal substances decay, for they are very similar in composition, they are in part dissipated into certain gases; there is left after the escape of these gases a quantity of dark-coloured charry-looking matter, which is comparatively unchangeable, and besides this there remains a small quantity of fixed earthy and saline substances, which all kinds of vegetable or animal matter contain. The chemical elements of ordinary manure are certain compounds of carbon, oxygen, hydrogen, nitrogen, and sulphur, and fixed salts.

The rotting of vegetable substances in manures is just the reverse of what takes place when plants grow, as they are gradually separated again into those very substances from which the plants were originally formed. In consequence of the many abundant sources of those gases, which form part of the food of plants, that exist all over the globe, it follows that the air always contains a small portion of them diffused throughout it, and hence plants can always obtain from it the gaseous substances which they require; nevertheless, as the quantity present in the air is always very small, the addition of manures, which yield more of these gases to growing plants than they could otherwise obtain, is always useful. With regard to the earthy and alkaline salts which plants contain, the case is very different; when we remove a crop, we take away a quantity of these salts, and the soil, of course, then contains less of them than it did before. There are not the same means naturally provided to restore to the soil these salts, as there are to restore to the air those gases which are essential to the growth of plants. It is true that fallowing does, to a certain extent, restore the soil to its original state, but without going into that subject, it is evident that it is even more important to supply saline, than gaseous matter to plants. Both are important elements of manure, but the former is the most important, because the natural means which exist for keeping up a regular supply of them to plants are less complete than those which regulate the formation and distribution of the gases.

The old chemists of by-gone times used to marvel greatly whence animals obtained the earthy substances which constitute their bones; it is now known that all animals which feed on plants obtain the phosphate of lime, which constitutes the greater part of bone, from plants. All plants contain phosphates of lime and magnesia, hence these are important constituents of manure.

The manufacture of pearlash and potash from plants has existed for a very long time. Plants are burnt merely for the sake of their ashes, which being rich in potash are valued as a source of that alkali. All plants contain alkali, either potash or soda; hence salts of these alkalies are constituents of many of the best manures: and the ashes of plants, rich in alkali, have always a beneficial effect when applied to land. The earthy phosphates and alkaline salts are the most important of the saline constituents of manure.

Looking at ordinary manures in a chemical point of view, we may divide them into those which supply the gaseous matters on which plants feed, those which supply alkaline salts and phosphates, and those which supply both at the same time. Farm-yard dung is of the best kind, and therefore it is adapted for all soils; it contains all that plants can want. Soot acts principally from the gaseous matters which it supplies to plants; whilst bones, and more especially burnt bones, may be taken as an example of a manure which supplies earthy phosphates.

Bearing these facts in mind, it becomes of the first importance to inquire what are the cheapest sources of these substances, and how they can be furnished to plants in the most economical and uniform manner.—*E. Solly.*

ON THE QUANTITY OF SEED-WHEAT PER ACRE.

IT is quite necessary for us to be acquainted with the habits of the plants we cultivate, before we can determine upon the degree of closeness with which they should stand together, so that, on soils of various fertility, the greatest crop may be obtained. Ignorance on this point leads to great error, as to the quantity of seed necessary on a certain extent of land. I have seen from three to four bushels of Wheat sown where three or four pecks would have been sufficient; four or five bushels of Barley sown where eight or ten pecks would have sufficed, and from six to seven bushels of Oats where only two or three were required. In this way a loss of a great quantity of seed is sustained by many farmers of the present day.

The crop of Wheat, I think, depends much upon the distance between the plants. In the experiments which I have made, I found that eight grains to a square foot was the quantity of seed which produced the best crop; these were planted three inches apart in rows six inches wide, and they produced from three to five large productive ears each, with scarcely any abortive ones. I found, also, that this quantity of seed yielded 28 to 38 productive ears per square foot, each ear thus having about four square inches to grow in. When more than this number grew on a square foot, some of them were abortive and many of them small; when a smaller number grew on that extent, they were long and coarse, there was a tendency to straggle over the ground, annual seeds sprung up, and the Wheat was more liable to disease, mildew, blight, &c. It may be said that 36 grains, each producing one stalk, might yield the same number of bushels per acre as the 8 grains which produce 36 stalks; but in the one case, each plant has only 4 square inches of ground for its roots to spread in—extending only 1 inch on each side of the plant, while in the other each plant has 18 square inches of ground to supply it with nourishment. In consequence of want of room the plants are unable to throw out offsets in the spring; the leaves being crowded, the straw gets soft and feeble, and ultimately becomes laid, and then yields a crop deficient both in quantity and in quality. Land that is in good condition always produces the best crop when the plants appear thin in spring. I have found a bushel of Wheat to contain 576,000 large healthy grains. This estimate was made from the red-straw-white Wheat, cleaned and prepared for seed, weighing 64 lbs. per bushel. Now, there are 43,560 square ft. in an acre, and multiplying this by 8, we have 348,480 grains, or 2½ pecks of Wheat, as seed sufficient for an acre of land. To this, however, should be added 1 or 1½ peck as the quantity which we may expect to be destroyed by birds, &c. We believe that if farmers were to reduce, on their good land, the quantity of seed Wheat they now use per acre down to 1 bushel, and if they were to dibble this in, their crop would be increased in productiveness.—*John Morton, Chester-hill, Stroud.*

COPROLITES.

COPROLITES are supposed to be the fossilised excrements of animals, possibly of antediluvian origin. Many specimens exhibit on their surfaces convoluted marks or impressions, counterpart as it would seem to the internal surface of the intestine, and they are rounded off at the extremities in such a form as shows that they must have been produced in the manner alluded to. But if the external evidence upon this point be strong, that afforded by chemical analysis is conclusive. This reveals to us the fact of their entire coincidence in composition with fæces of animals now living, allowance being made for those changes which the lapse of so many ages must necessarily produce. We have in them the earthy phosphates in much the same proportion as they occur in bones, accompanied sometimes by organic matter, though at other times this seems to be wanting; this depending no doubt on the greater or less exposure to the action of the elements. The same circumstance is noticed with respect to fossilised bones, which, having been protected by a strong envelope from the causes of decay, have their organic matter (gelatine) intact, so that this may even be extracted as from the fresh bone, and soup prepared from these remains of a former world.

Bones, however, of far less antiquity than these, if exposed to the air and the action of moisture soon rot, as the farmer well knows; their gelatine being converted into gaseous compounds of carbon, hydrogen, oxygen, and nitrogen. The bones which are imported from abroad into the ports of London and Hull have lost much of their organic matter, so that their action upon crops must be attributed almost entirely to their phosphate of lime. This view is corroborated by Mr. Hannam's experiments on bones, burnt and unburnt, in which he obtained the same weight (within a fractional quantity) of Turnips from a quarter of each. Thus the opinion of Professor Liebig as to the vast importance of phosphates as a manure for the soil of Great Britain, is borne out by experiment, and it would appear that they are still more essential than even ammonia itself.

Coprolites then, if they could easily be had in sufficient quantities, and could be reduced economically to a fit state for the purposes of the agriculturist, would be to him a treasure indeed. I am sorry to say, however, that with Professors Buckland, Henslow, and others, I fear the sanguine statements on this subject, of the great German chemist, will never be realised.

The specimen upon which I operated was sent me by Mr. Deck, of Cambridge, a very clever geologist and chemist. He exhibited, in conjunction with Prof. Henslow (who read a paper on the subject), a number of Coprolites obtained from the Suffolk crag. They were found embedded in the cliff, at Felixstow, and numbers more were found mixed with the pebbles on the beach, where they had been exposed, as the rounded form bespeaks, to the same rolling process.

The Coprolites are thus difficult to be distinguished by their external appearance alone, from the siliceous and other stones with which they are mingled. Of six or seven of them given to me for Coprolites, three

or four were pebbles. By attention, however, they may be distinguished, even without breaking, by the pebbles being much colder to the touch than the true Coprolite: the latter, too, is much softer than the former. When broken, however, there can be no mistake, the Coprolites having the texture and colour of broken chocolate, and when rubbed violently they emit a peculiar smell, the intensity of which affords a criterion whereby to judge of the proportion of their organic constituents.

Prof. Henslow informs me that these Coprolites are the excrements of a fish of the shark species. Mr. Deck, in collecting them at Felixstow, found a fossilised bone, originally the internal ear of a whale. It is probable that the fish yielding the fossil excrement served as prey to this monster of the deep. I conclude by giving the analysis of these Coprolites:—

Earthy phosphates	56
Carbonate of lime	15
Matter insoluble in dilute muriatic acid	19
Organic matter and water inseparable at 400°	8
Water	2
	100

—*W. H. Potter, Fore-street, Lambeth.*

AGRICULTURAL EXPERIMENTS.

The argument by induction in favour of any particular manure must rest upon various and multiplied experiments, and those which I am about to detail serve to show into what serious errors we may be led by taking one or two alone for the basis of a general conclusion. Single experiments are only like straws thrown up into the air to show from what quarter the wind blows; they may be of use to point out the course which should be pursued, but that is all the evidence they afford. It would be dangerous to infer that this or that manure is good or bad, because the one or the other may have succeeded or failed in some solitary trial. Thus, for instance, in the Journal of the Scotch Agricultural Society, Mr. Maclean has recorded the results of 28 trials of different manures as top-dressings upon Grass; two of them were salt and sulphate of ammonia, but with both of them only single experiments were made, and the conclusions to which they lead are directly the reverse of those to which my experience of them conducts me. With him, salt was the most successful of all the manures, and gave the largest increase of Grass; sulphate of ammonia was the least successful, with the exception of the muriate, and gave the smallest increase of Grass. With me, salt is useless, and sulphate of ammonia is very valuable when used in the right proportion. To ignorance of this proportion Mr. Maclean's failure may be ascribed; he used too much; for if I recollect right, he laid it on at the rate of about three cwt. per acre. His muriate of ammonia must have been applied in still greater excess; for there, and there alone, he suffered loss, the Grass being injured by the application. On the other hand, my failure with salt is no argument against its value as a manure in other situations; for it may be accounted for by my proximity to the sea. In any situation where the trees are killed or stunted in their growth by the sea-breeze, as they are here, in a south-west exposure on high ground, it is evident that the atmosphere must sometimes be saturated with muriate of soda, and probably enough of that material is thus conveyed to the grass. We must therefore bear in mind, not only that the failure of solitary experiments is not to be considered conclusive evidence against any new manure, but that even their success is to be distrusted till confirmed by repeated and various experience. Against the latter class of errors, however, I have no great reason to stand upon my guard; for all my single experiments proved signally unsuccessful. They were made with six different manures, and in all of them I have no doubt that the dose was too large. Two of them bear ridiculous names, and are very expensive; but that would be of little consequence if it could be proved that small quantities of them would more than repay the cost.

It will be seen that in two instances the application of the manure was injurious instead of beneficial; in one it was wholly inefficacious, in the rest the amount of loss is obtained by deducting the increased value of the produce from the cost of the manure upon an acre.

	Expense.	Loss.
I. 800 lbs. of urate	£1 0 4	£0 11 3
II. 37½ bushels of Clarke's desiccated compost, with 20 bushels of wood-ashes	3 13 7	2 17 3
III. 40 bushels of Poittevin's manure, No. 35, with 20 bushels of ashes	3 12 1	3 16 1
IV. 320 lbs. of oxygenated alkali, with 20 bushels of ashes	4 5 1	4 9 1
V. 320 lbs. of ammoniated alkali, with 20 bushels of ashes	6 5 4	5 16 10
VI. 35 bushels of Poittevin's, No. 170, with 20 bushels of wood-ashes	1 5 6	106 15 10

In the last instance the absolute neutrality of the application is so extraordinary, that, did I not know the very great care that was taken in conducting the experiments, I should be tempted to suspect that some error had crept into the account. Indeed, complete accuracy in these experiments is of so much importance, that before I proceed with the details of that more instructive series to which I have next to invite attention, I must explain the mode in which they were conducted. The produce per acre was computed from the trial of smaller quantities. A certain length of swathe on each plot of ground to which the manures were applied was measured and weighed both in the state of grass, and after it was made into hay; and this operation was repeated three times, and the mean of the results was then compared with the mean obtained from similar trials on the unmanured land adjoining. In estimating the value of the hay, it was taken at the then market price of 3*l.* 15*s.* per ton. Seven experiments were tried with nitrate of soda, which in every instance increased the growth of the grass, but in no instance was that increase sufficient to reimburse the cost. The price of the nitrate was 1*l.* per cwt., and the value of the increase being deducted from the expense, gives the following table of loss sustained:—

I. 1 cwt.	£0	2	3	VI. 1 cwt., 16 bushels of wood-ashes, and 8 of salt	£1	2 11
II. 1¼ cwt.	0	10	9			
III. Do. in another place	0	11	9			
IV. Do. do.	0	2	6			
V. 1½ cwt.	0	7	6	VII. 240 lbs.	1	11 4

In the two last instances the land was in better condition, and might seem not to want manure at all, for without any it yielded more than two tons of hay per acre. It is to be observed that where the smallest quantity was used, the loss, too, was the smallest; and it is evident that if only a small proportion of manure is needed to supply the grass with the nutriment of that sort which it requires, every addition of it beyond that proportion must be expended in vain, for the action of frequent rains would not allow it to remain in the soil stored up for future use. Perhaps 50 or 60 lbs. would have produced the same effect as a larger quantity, and then there would have been, in the two last instances, a clear profit of about 7 or 8 shillings. The same conclusion is very strikingly indicated by the experiments with sugar scum, an article much used in France in the cultivation of the Vine, and imported for the vineyards at considerable expense. Its cost to me was 1*l.* 5*s.* per ton. The application of it invariably produced a greater quantity of hay, but almost in an inverse proportion to the quantity employed; there can be no doubt, therefore, that it is beneficial as a manure on grass, if only the right proportion can be discovered; but it must be owned that the admixture of a small quantity of wood-ashes in each case keeps its own specific virtue somewhat in the dark. The cost of the wood-ashes is estimated at 4½*d.* per bushel.

	Increased value of Hay.	Gain.	Loss per Acre.
I. 24 cwt. and 8 bushels of ashes	11*s.* 3*d.*	—	£1 6 9
II. 20 cwt. and 8 do.	8 6	—	0 19 6
III. 16 cwt. and 8 do	14 0	—	0 14 0
IV. 12 cwt. and 4 do.	14 0	—	0 2 6
V. 8 cwt. and 4 do.	14 3	—	0 0 3
VI. 8 cwt. and 4 do. in another field	14 3	2*s.* 9*d.*	0 0 0

In the last case the land was poorer than in the preceding, the produce of Hay per acre in the adjoining unmanured part being 1 ton 12 cwt. 34 lbs.; whereas in the other it amounted to 2 tons 3 cwt. There was also a great difference between the 1st and 2nd experiments in the quality of the land. On the first the quantity of hay without the manure was only 15 cwt. 50 lbs., while the other produced without manure 2 tons 6 cwt. 28 lbs. It thus appears that sugar-scum is most effective where manure is most wanted. It is a great mistake, however, to suppose that the more you use the more you will get from it, for the maximum of produce was obtained from the smallest quantity. It remains to be tried whether a still smaller quantity may not produce the same effect; and whether, under any circumstances, it benefits the succeeding crop. At present there is no great encouragement to persevere in its use as a top-dressing for Grass. The experiments with guano were more successful; but though up to a certain point an increased quantity of manure gave an increased quantity of produce, yet they still bring us to the same conclusion, that, as the proverb says, too much of anything is good for nothing. The cost of this manure was 12*s.* per cwt.

	Increased Value of Hay.	Loss.	Gain.
I. 3½ cwt. and 20 bush. of ashes	£2 8*s.* 9*d.*	—	£0 1 4
II. 3½ cwt., 1 year old, and 20 do.	1 11 5	16*s.* 0*d.*	—
III. 3 cwt. and 1 cwt. of nitrate of soda	2 0 4	15 8	—
IV. 2 cwt. and 4 bushels of ashes	3 0 7	—	2 15 1
V. 2 cwt.	1 15 9	—	0 11 9
VI. 1¾ cwt.	1 13 9	—	0 12 9
VII. 1½ cwt.	1 4 5	—	0 6 5
VIII. 1 cwt., 6 bushels of salt, and 16 bushels of ashes	0 5 8	18 0	—

In the last instance, it may be that the soil was almost saturated with as much nutriment as the Grass required; for its produce without any manure amounted to 2 tons 7 cwt. 90 lbs., and thus 18*s.* worth of the manure produced no effect at all. The contrary fact will account for the great success of the 4th experiment, for there the weight of hay on the unmanured part was no more than 12 cwt. 34 lbs. From a comparison of the two first it appears that guano loses much of its efficiency by being kept, its volatile parts being dissipated in the air, and that even the best, applied to good land in large quantities, will not yield any adequate return. The weight of hay in this case, without the manure, was 2 tons 1 cwt. 70 lbs. From the experiments upon sulphate of ammonia it is not so easy to deduce any certain conclusions, some of the results being very anomalous. The moistness of the spring was favourable to its action generally; but as it was not all laid on at the same time, the fact of the weather being different at different times may account for some of the variations. The cost was 17*s.* per cwt.

	Increased Value of Hay.	Loss.	Gain.
I. 336 lbs. sown at twice	£2 0*s.* 5*d.*	10*s.* 8*d.*	—
II. 224 lbs. from the bottom of the cask	2 0 3	—	£0 15 9
III. 224 lbs	2 18 0	—	1 4 0
IV. 180 lbs. sown at twice	1 8 0	—	0 0 9
V. 120 lbs. sown at twice	0 14 4	3 10	—
VI. 120 lbs., and 4 bush. of ashes	2 3 0	—	1 2 11
VII. 80 lbs.	0 11 3	0 11	—
VIII. 73 lbs. and 640 gallons of drainings from the farm-yard	2 8 9	—	1 17 0
IX. 60 lbs., and 4 bush. of ashes	1 14 9	—	1 4 9

It is remarkable that in two out of the only three cases, where the application was made at two different times, loss ensued, and in the third a very insignificant profit. In the other case of failure, the land produced 2 tons, 4 cwt. per acre, without manure. The second and third experiments seem to show that on poor land as much as 2 cwt. may be usefully employed; for in the former case, the unassisted land yielded only 15 cwt. 52lbs. of hay; and in the latter, 19 cwt. 22 lbs.; but that 3 cwt. is too much is the only inference to be drawn from the first, for there too the natural produce was only 10 cwt. 105lbs.; in all the rest it exceeded 2 tons. It will also be seen that in the two last experiments, where the quantity used was smallest, the profit was largest. It will be a pleasant doctrine for farmers if it can be proved that the less expense they incur in the use of an artificial manure, the larger profit they will gain; and this rule, it seems, applies equally to a temperate use of their own farmyard manure; for two portions of equally good land being watered with drainings,—the first once, and the second twice—the first gave an increase of the value of 11*s.* 4*d.* above the adjoining land; the second fell below it nearly to the same amount. Some uncertainty, however, attends this experiment, because the liquid may not in both cases have been of equal strength.—*L. Vernon Harcourt, Westdean House.*

(To be continued.)

ON MINERAL & INORGANIC MANURES.—No. I.

By Professor Charles Sprengel.

(Translated from the German.)

It has been previously observed that the substances used for manures are composed of earths, oxides, alkalies, and acids, and that the last mentioned occur always combined with the first into salts.

Although agriculturists make now-a-days far more use of mineral manuring substances than in former times, having become convinced that they take as active a part in the nourishment of plants as organic manures do, still several, which besides those hitherto used may be of avail, have been as yet entirely neglected. The cause of this neglect probably rests on the insufficient knowledge of mineral manures, as most believe that they only act by improving the texture of the soil, or that they promote vegetation merely by dissolving the humus; in fine, that they are only so far useful as they excite plants to a more energetic vegetation. It may, however, be now assumed with certainty, that they are a real food of plants, and as essentially necessary to their constitution as the oxygen, hydrogen, carbon, or nitrogen contained in the organic manures. It is not less true, that to this mistaken view of the action of mineral manures, many real advantages have been hitherto sacrificed, because the culture of plants would have been carried on more effectively, if the principle had been acknowledged that plants have to obtain a necessary quantity of those mineral substances from the soil which are found in them by chemical analysis. Even the phenomenon that on each kind of soil some particular tribe of plants will locate itself spontaneously, ought to have led the farmer to an opinion different from that hitherto entertained. Sandy soil, for instance, will produce other plants than marl, and this again other than a peaty soil, &c. Thence we may learn that the growing of plants is dependent, generally speaking, on certain mineral substances contained in the soil, and that it is working in opposition to the very nature of crops to plant them in localities, where (according to their chemical constitution) it is impossible for them to grow. We find every day that many wild plants only come up in spots where the soil abounds in potash, or gypsum, common salt, manganese, &c.; and why should we doubt that cultivated plants, also, must find some particular mineral substance abundantly in the soil where they are found to grow luxuriantly? According to the opinion of several Naturalists, carbon, hydrogen, oxygen, and nitrogen alone constitute the proper nourishment of plants, so that if mineral substances occur in them, they are to be considered merely accidental. But with the same plausibility it might be assumed, that nitrogen, &c. are the merely accidental ingredients of plants, and that the minerals are their real nourishment.

Some others assert that plants possess the power of forming the mineral substances which they contain out of carbon, nitrogen, &c., transforming them by their vital powers into mineral substances; and they refer to some experiments made long ago; but, as it can be proved that these have been made very imperfectly, they do not deserve any credit, and though they were worthy of confidence, they do not prove what it is intended they should. Very lately, a believer in this doctrine of the nourishment of plants asked the following question: (*vide* the preface to "Schübler's Agricultural Chemistry," 1838.) "How is it, that after 100 crops reared on the same soil, there are found in it not only traces, but ¼, ½, and even entire grains (per cent.) of certain salts? or, how is it, that on average calculation, the corn crops of 20 years contain in their grain and straw more phosphate of lime than any soil in the world contains? for phosphate of lime is nowhere an original constituent of the soil." The same author says, further, "If Hermbstädt obtained 936 lbs. of calcined potash, from 2361 lbs. of the common Mugwort, (which he grew on 18,000 square feet of a sandy soil), each cubic foot of the soil must have contained more than 340 grains of potash for the use of the plants. But as this could not be assumed to be the case with the arid sandy soil of Berlin on which Hermbstädt made his experiment, the great amount of potash in the plants is to be ascribed to their luxuriant vegetation, not to the composition of the soil." To this I reply: According to several of my experiments, made with great accuracy, several, even sterile soils, which have never been manured with dung, and where, consequently, the constituent substances were originally inherent in the soil, contain 1—1½

per cent. of phosphate of lime. Now, as the Magdeburg acre of land contains 25,920 square feet; as, moreover, the roots of corn penetrate at least one foot in the soil, and as the Rhenish cubic foot of earth weighs (at an average) 100 lbs., the plants of one acre will have 25,920 lbs. of that substance to absorb, though the soil only contained 1 per cent. of the phosphate of lime. But the Wheat crop of one acre of land contains at the utmost only 5 lbs. of phosphate of lime; and consequently the 25,920 lbs. will suffice for 5187 Wheat crops; nay, though the soil contained only $\frac{1}{100}$ per cent., there would be enough of it for 52 Wheat crops. The Barley crop of one acre contains about 6 lbs. of phosphate of lime, and therefore 4320 crops would be nourished by the same amount of phosphate. A crop of Oats, grown on one acre, contains 5 lbs of phosphate of lime, consequently 5187 crops will find a sufficient amount of the above mineral substance in the soil.

It is true that it cannot be assumed that the corn will be able to abstract from the soil even the least particle of phosphate of lime, still this calculation will fully prove, that the assumption of the author of the above work, viz., that 80 corn crops will abstract from the soil more phosphate of lime than any soil can possess, is utterly unfounded. The same is the case with the potash, which the plants are said to generate in themselves by their luxuriant growth, the most accurate examination of several very sandy soils and subsoils having shown to me, that they often contain $\frac{1}{10}$—$\frac{1}{8}$ per cent. of potash. This potash was not combined with any acid into a soluble salt; on the contrary, it was always combined with silica into a silicate insoluble in water; but as this is gradually dissolved by the carbonic acid contained in rain-water, (carbonate of potash, an easily soluble salt, being formed,) the roots are able to provide themselves constantly with the necessary amount of the alkali. By this wise arrangement of nature, the silicated potass of the subsoil has nourished for thousands of years the deep-rooted plants; and considering the amount contained in the lower strata of soil, there is no doubt of its being yet sufficient for many centuries to come. The roots of Mugwort penetrate four feet deep in the soil; therefore it may on one acre of land draw upon four times 25,920: viz., 103,680 cubic feet, or 10,368,000 lbs. of soil. According to experiment, 100 lbs. of earth contain on an average one-third per cent. of potash; consequently the Mugwort found on the area of one acre of land 20,736 lbs. of potash, from which it might well receive those 936 lbs. or more of carbonate of potash. I may as well mention that I never subjected the subsoil of Berlin to chemical analysis; but I have examined similar soils of the diluvian formation, and have often found more than one-fifth per cent. of potash in them. These calculations, I think, prove that the power which has been attributed to plants of forming substances within themselves, is based on erroneous suppositions. We often do not believe that soils contain the mineral substances which we find in the plants growing on them, and yet an accurate analysis shows afterwards that they are abundant. Still at times the soil contains scarcely a trace of those substances of which the plants are composed; but even in this instance it is not necessary to assume that they are formed by the plants, as we shall see hereafter that the rain conveys annually more than 50 lbs. of earths and salts to the soil of one acre.

(To be continued.)

Home Correspondence.

The Berberry Blight.—It is somewhat remarkable that both persons and plants will get characters frae the world that they dinna deserve. The Berberry, I think, has come in for a share o' muckle abuse that it disna merit. I mind fu' weel when I was a young callant o' wandering frae home ae day, and in my wanderings came upon a large Berberry-bush wi' plenty o' ripe fruit on it; I partook o' the fruit, and also broke off some o' the branches that were well laden, to carry them hame. Before I reached my father's house I was met by an auld woman who was looked up to by her neighbours for her superior knowledge; she saw the fruit I was carrying, and speered gif I had eaten ony o't. "O, ay," says I, "a wamefu' o't." "Weel, weel, my man, ye hae been eating pousin, and ye'll may be no live lang." I canna describe the feeling that came o'er me at sic an announcement; I was instantly placed under medical treatment, and forced to drink wonderfu' draughts o' buttermilk to conteract the evil effects o' the Berberries, besides receiving a lecture about going to the Berberry-bush, as if it had been the fabled fatal Upas-tree; and to this present hour the ideas o' Berberries and buttermilk are often associated in my mind. But as Mr. Wighton wishes to ken the reason why the Berberry is blamed for having an "evil influence upon Corn," perhaps some o' the following statement may satisfy him as a reason why it is blamed. In the "Quarterly Journal o' Agriculture" there is an article "On Smut, Canker, and Rust or Mildew;" and it is there stated that, "in consequence of the leaves of the common Berberry exhibiting a similar affection to the rust in Corn, farmers, both in England and on the Continent, have concluded that the infection spreads from the bush in the hedge to the Corn in the field; and this notion is sometimes strengthened from the rust appearing in patches and stripes among the Corn, as if it had been carried thither by the wind from the Berberry-bushes." Now there was ance a learned gentleman wha had some o' his Peach-trees trained over the tap o' his garden-wall, wi' their points towards the antipodes: he also wrote a treatise "On Blight in Corn;" and appeared to countenance in some degree the popular belief respecting the evil effects o' the Berberry on Corn. He tells about "Mildew Rolesby, in Norfolk," what an unco' place it was, where Berberry abounds and Wheat seldom succeeds! and we are informed, in the "Library o' Entertaining Knowledge," vol. ii., "that the fructification of the Berberry is incomplete unless the stamens be irritated by insects, when the filaments suddenly contract in a most remarkable manner towards the germ; the flowers are therefore, by a beautiful arrangement of Nature, peculiarly attractive to insects, and thus the Berberry may become injurious to neighbouring plants." And we are also informed by the Rev. Dr. Singer that the views of Sir Joseph Banks, and of some intelligent practical farmers relative to the evil influence of the Berberis vulgaris, induced the late Admiral Sir William Johnstone Hope to give orders for the total extirpation of the Berberry-bushes which intermixed with thorns in the hedge-rows; and since that was done, and for above 20 years, no such distemper has appeared in the fields. But for a' that, there are some auld farrant cheils, if they get a few facts to stand by, they are just as stiff as the facts themsels, and they will not believe in the popular creed, although it should be supported by knighted philosophers or presidents o' the Royal Society, or preached up by reverend divines; and as lang as the twa-celled Puccinia graminis differs frae the pustulated Æcidium berberides they will not believe. De Candolle opposes the notion that the Berberry is injurious to Corn, and says that he should not have agitated the question, had it involved a plant less important than Wheat, or a philosopher less distinguished than Sir Joseph Banks; and Dr. Greville, when speaking of the Berberry Blight in his Scottish "Cryptogamic Flora," says, "This minute gastromycus has given rise to the vulgar opinion that the neighbourhood of Berberry-bushes is extremely detrimental to fields of Wheat. It is well known that the disease called the rust in Corn is highly injurious; but the colour of the rust and that of the present plant constitutes the only similarity between them. They belong, in fact, to two different genera, and of course cannot propagate each other." And gif ony o' the readers o' the *Chronicle*, wha tak an interest in such a subject, should turn to the ninth volume and 327th page o' the "Gardeners' Magazine," they will find "Notes on Mildew, from a Lecture by Professor Lindley;" they will there see figures of the different fungi that will, maybe, convince them sooner than a' that can be said about it for a lang time; and I may just conclude this notice by a quotation frae "Paxton's Horticultural Register" on the same subject, the writer says that "it would be no less rational to maintain that a field of Wheat would spring up if we should sow Berberries, than that the rust growing on these should produce the Corn-rust. Should it be said that it is the difference of the nutriment of the fungus which causes the difference, I should ask whether a difference of soil would produce Rye on Oats when Wheat-seed only had been sown?"—*A Moorland Gardener.*

Experiments with Manures.—Table shewing the quantities and cost per acre of Five different Manures used in a field of Mr. A. Bubb's' at Witcombe, in Gloucestershire, and their relative effects on the quantity and quality of a Wheat crop, as compared with that in the same field where no manure was used. The Wheat is valued at 6*s.* a bushel, and the straw at 40*s.* a ton. The proportions of salt and lime were, salt 1, lime 2.

Manure used.	Quantity.	Cost. £ s. d.	Produce.	Value of Produce. £ s. d.	Profit or loss on Manure. £ s. d.	Weight of best Corn.	Weight of Straw.
None . .	. .	. .	Best Corn 29 3 1 Tail ditto 0 1 1	8 10 7½	. .	p bush., lbs. 61¼	lbs. 3630
Nitrate of Soda . }	1 cwt.	1 2 0	Best Corn 36 0 0 Tail ditto 0 0 1	10 16 8	Profit. 0 19 6½	61¼	4624
Kiln Dust	40 bushels	1 0 0	Best Corn 30 2 0 Tail ditto 0 2 0	9 0 6	Loss. 0 11 1½	61¼	4088
Lime and Salt . }	60 bushels	1 5 0	Best Corn 32 0 0 Tail ditto 0 1 0	9 13 10½	Loss. 0 10 0½	61¼	4020

The soil is sandy and of good quality.

Ravages of the Slug on the Wheat Plant.—As the ravages which Slugs make amongst young Wheat renders the adoption of any method likely to destroy them a great boon to the farmer, I may perhaps be allowed to state that the most effectual way, where good stone lime cannot be had, is to scatter a number of Cabbage-leaves over those parts of the field which is worst affected, and let a number of boys or women look over them every fine morning, and pick off what may be attached to each leaf. I dare say the plan is pretty generally known and adopted amongst gardeners, but some farmers may hesitate about it on the score of expense, yet is it not nearly so expensive as many would suppose; and when the land is tolerably good it well repays itself. I may add that slices of Swedish Turnips do as well as Cabbage-leaves, and even the tops may be used also, or anything likely to be attractive to this destructive pest.—*S. N. V.*

Cultivation of Wheat.—The following calculations were made from Wheat grown in the year 1843, on land in my occupation belonging to Sir Oswald Mosley, Bart., situate in the parish of Tutbury, Staffordshire.

Description of Wheat.	Cultivation.	No. of bushels per acre weighing 63 lbs. each.	Weight of Straw per acre. cwt. qrs. lbs.	Average Weight of Corn per Imperial bushel. lbs.
Red	Drilled in	29⅔	31 2 6	66¾
do.	Ploughed in	28⅔	31 0 23	64
do.	Harrowed in	33⅔	30 3 4	65¾
White	Drilled in	29¼	29 3 22	64¼

—*William Cox.* [It is not stated from what extent of land these calculations were made; but we do not think the difference between the several cases greater than may be accounted for by variety of soil, or than probably would have appeared on the same plots though they had all been cultivated alike.]

Corn Weevil.—A correspondent of the *Chronicle* complains of the depredation committed in his malt stores by the Weevil. About 15 years since Messrs. Fison, of Thetford, suffered greatly by this insect. They destroy the farina, leaving the husk, to all appearance sound, except at that end where it gained admission; after several ineffectual attempts to get rid of them they determined to try fire, which proved perfectly successful. It was applied thus,—a large quantity of furze was procured, the premises were emptied, and they were fired on the floor; plenty of help was provided, so that once kindled it was continually stirred about to prevent the premises taking fire. I have no doubt a better plan would be to fumigate them with sulphur. A dish of charcoal, with one or two pounds of sulphur, and the windows and doors well closed, would be all that is required, and the expense less than half-a-crown.—*James Fison.*

Reviews.

The Economy of Farming; from the German of Prof. Burger. With copious Notes from the Works of Thaer, Sprengel, &c. By E. Goodrich Smith. Wiley and Putnam. 8vo, pp. 132.

THE causes on which any agricultural fact or appearance depends are very many and variable. This renders it difficult for individual farmers, though examining the results of *their own* experiments, to determine what portion of them may be considered as owing to the causes which they had put in action, and how much is due to the natural causes over which they have no control. How much more difficult, then, must it be to determine the real meaning and value to be attached to reports of experiments, when the results, indeed, are given, but only some of the agencies described of which they are the consequences. In fact, in a country like our own, covered by such various soils, and experiencing such variable and various climates, were there not a way of subtracting from the results of agricultural experiments, that portion of them which is owing to the external circumstances of the several cases, reports of such experiments would be valueless, except in the immediate neighbourhood of their trial.

The method alluded to consists in gathering together a great many experiments on one subject, performed under every possible variety of circumstances, and taking their average result. Such an average will, in all probability, be the proper effect of the artificial cause, whatever it may be, that was put in action. For all the variable natural causes, in the comparison of a number of cases in which they pull in opposite directions, will be found to neutralise one another. And thus it is that the remark made by the Hon. and Rev. L. V. Harcourt, in his report of experiments with manures, which will be found in another column, is true of almost every question in farming, that a great number of facts are necessary as the foundation of a conclusive argument on the subject.

These observations are suggested by the perusal of Prof. Burger's work on "the Economy of Farming." We have nowhere seen such a great body of facts collected together, bearing on the subjects treated of. We call them *facts*; they are reports of experiment and observation made in many different quarters; and though individually such reports are to be received with distrust, yet a great number being collected, the average result may reasonably be regarded with confidence.

The subject of this work is necessarily of primary importance to the practical farmer; it is with him the only test which determines the value of any proposed improvement on his practice, however beautiful in other respects the proposal may be, and "the economy of farming" ought therefore to be the object at which all agricultural writers should aim.

The object of the good farmer is to produce order, cleanliness, and fertility, where his unskilful predecessor had left all in confusion, not because these are things desirable in themselves, but because they are means to a profitable end; for as Professor Burger states at the commencement of his work:—

"The object of farming is that of all kinds of business, viz., by means of labour and money, judiciously employed,

to produce gain, or to acquire money:—in other words, for one so to employ his labour and capital as, by the management of his affairs, to secure the highest income." Professor Burger divides his subject into two branches. The first refers to "the outer household affairs," as, in common with other portions of the work, it has been somewhat too literally translated, and includes within its range all matters connected with labour and manure. The second refers to "the inner household affairs," the Domestic Economy, in fact, of the farm; and under this head are considered the arrangement and distribution of labour, the duties of employer and employed, and the mode of keeping farm accounts.

Every plan or practice suggested or described under these heads is referred to its ultimate expense or profitableness, for the real character it must hold in the eyes of the practical farmer. Thus, to take the subject of manure, after a general statement of what that is which constitutes manure, Professor Burger considers—

1. How much is needed to retain a given extent of land in fertility? And this, being dependent on the character of the soil and that of the crops grown on it, is answered in great detail with reference to both of these particulars.

2. What animals produce the necessary quantity at the cheapest rate? and, as affecting this, the effect of the character of the fodder on that of the manure produced by its consumption is taken into account.

3. What number of animals are thus required?

4. What weight of manure is obtainable from the consumption of a given quantity of a given kind of fodder?

5. What proportion, on a farm, must the production of plants for sale bear to the production of plants for fodder?

6. What rotation of crops must be adopted, in order that, on a given extent of land, the supply of manure from the manure-producing crops may be suited to the wants of the exhausting crops, so that the land be not gradually deteriorated?

The answers to all these questions are illustrated and enforced at great length by the details and results of numerous observations and experiments; and putting out of sight the admirable arrangement of the subject, the "Economy of Farming by Professor Burger" would be a most valuable addition to our agricultural library, were it only on account of the number of facts and experiments recorded in it. Many of these, it should be stated, are introduced in the form of notes, and are extracted from the works of other German writers of high repute.

In conclusion, we extract from the translator's preface the following paragraph, from which the general character of this work may be gathered;

"The great distinction in German Agriculture, compared with our own, is *economy*. The question is not whether a great crop *can* be produced, or a fine story can be told, what large animals can be raised, &c.,—but what is the whole cost, the expenditure of labour, of land, of manure, &c. For this reason computations have been made, and the proportion of all the parts and processes has been fixed. Economy compels them to weigh and measure their fodder. The minutest details have been entered into, the most difficult points examined, and the results brought out."

Miscellaneous.

Improvements in Wigtownshire.—We proceed to give some account of improvements made by Lord Stair, on his Lordship's home farm, Culhorn, Wigtownshire. We call public attention to the subject to show that all circumstances—natural disadvantages, soil, climate, and outlay—being taken into account, the improvements at Culhorn are encouraging and important to the community, and exhibit results interesting and advantageous to the Agricultural world. In calling attention to Lord Stair's improvements on his home farm, all acquainted with Wigtownshire during the last three years, will understand that we circumscribe ourselves to a narrow spot in the wide field of improvements which have been executed at so much expense by his Lordship, by thorough-draining, fencing, &c., since he succeeded to his extensive estates in Wigtownshire. The portion of Lord Stair's home-farm, now alluded to as under improvement, may be stated at 150 acres, composed of the following inclosures:—1st, Borland moss; 2d, Glenhapple; 3d, Fleming Park; and 4th, Craignerks. There was a good deal of work to be done on the farm, first in cutting large channels into which to take the main drains and water from the various fields, grubbing of trees, levelling of old mound fences, repairing of roads, &c. Prior to these operations, the fields alluded to had been grazed with cattle, so far as was safe and practicable. The first field which we shall consider—Borland Moss and Cowpark, 16 acres in extent—was altogether a morass, and part of it had been cut over for peats for the previous 30 years. This was certainly the roughest and most unmanageable of all the fields taken as a whole; but still in a large proportion of the other fields much swampy, and to all appearance worthless, ground presented itself, rendering draining most difficult, and furnishing little available soil even when dry. Good working, top-dressing, and manuring, however, has made a great change even upon this ground. Borland Moss was commenced to be drained in autumn 1840, with drains 15 feet apart, 3½ to 4 feet deep. Wooden soles were used, and a quantity of brushwood covered in above well-burned tiles. The draining completed, next came the paring and levelling of its rugged peat-cast surface. This was partly done with the plough, where the ground admitted of it, and partly with the paring spade; all refuse turf, brambles, and heath being collected in heaps, burnt, and the ashes spread on the surface. The field got dry and was ploughed and sown with oats in spring 1841, yielding that year, though wet and unfavourable, an extremely heavy crop of straw, and, even as regards grain, fully an average crop, of the growth of the district. After harvest the stubble was heavily top-dressed with sand and gravel taken from a bank in the upper side of the field; this was ploughed in and lay till spring, when the ground was well worked, limed at the rate of 90 bushels (price 37*s.* 6*d.*) per acre, and the field was then manured for turnips as follows:—About 10 acres received 30 single cart-loads of good farm-yard dung per acre, sown with Swedish Turnip-seed, the remainder got 15 such cart-loads and 15 bushels of bone-dust per acre, sown with Dale's Hybrid. We saw the crop, which was excellent. Indeed we do not think that a better crop was grown on any soil in the South of Scotland last year. Many of Laing's purple-top Swedes, when cleaned and the top and root cut off, weighed upwards of 15 lbs. weight. This year's crop of oats on the same field was too luxuriant, as a considerable portion lodged with the heavy rains and did not quite fill; but still good judges estimate the gross produce of Borland moss, white crop 1843, at between 50 and 60 bushels per acre, besides a very heavy yield of straw. 2. Next—Glenhapple, containing 56 Scotch acres—commenced also in 1840. More than a third of this was bog and quagmire like Borland moss, and a great part, even where ploughable, soil of a very poor kind. About one-third was thorough drained,—the field was levelled like the first mentioned, and sown with oats in 1841. The crop was very fair in the greater part of the field, but inferior in some thin parts which had formerly been soured with water. In autumn and winter the moorish parts of this division were well top-dressed with gravel and other stuff, and another oat crop taken in 1842, which was excellent, the quality of the oats being upwards of 40 lbs. weight. This field was well worked for turnip-crop 1843, and manured with from 25 to 30 cart-loads of ordinary farm-yard dung, together with 25 bushels of bones, or 3 cwt. of guano per acre. The crop is an excellent one of all kinds, healthy, thick, and will feed well. Third field—Fleming Park—about 37 acres; 20 acres drained, of which 8 acres were very bad moss, white running sand below, and most difficult to drain. Crop of oats 1842, good; and this year, after a proper top-dressing of compost, with lime and ditch-cleanings, this field also yielded a very good crop. Fourth field—Craignerks—38 acres, formerly a wet rushy pasture field, but of very unequal nature and quality—though, on the whole, in better state than the other fields—all thorough-drained, and sown last spring with oats: the crop was a very superior one. In executing the improvements on Culhorn farm, a strict regard was paid to efficiency combined with economy,—every operation was entered upon with the view of obtaining a profitable return for the outlay; and how far this object has been realised, the following abstract statement of expense of improving the four divisions of the farm formerly mentioned,—the aggregate amount of produce of crops 1841-42, and 43,—the actual rent previous to improvement, and the present estimated value of these lands, will sufficiently testify. The expense of improvement will stand thus:—

Draining, say 94 Scots Acres with tiles, from 4 feet to 2½ feet deep, being at the rate of about £7 16*s.* 1*d.* per acre	£733	19*s.*	3*d*
Expense of sinking the course of the stream for outlet to drains	24	8	6½
Paring and burning, and levelling old fences	61	6	5
Grubbing trees, whins, &c.	62	12	3
Erecting division and road fences	64	19	8
Making roads for use of farm—about	30	0	0½
Total expenditure in permanent improvements	£977	6	2

Crop of last three years stands thus:—1. The oat crop in Borland Moss, and Cowpark, and Glenhapple, in 1841—together, 72 acres—amounted to 244 bolls of 12 Winchester bushels, or at the rate of 40 bushels per acre; weight, 39 to 40 lbs. per bushel. 2. In 1842 about nine acres of Borland Moss and Cowpark were sown with turnips, as previously mentioned, the produce of which amounted to about 40 tons per Scotch acre. The remaining seven acres were planted with potatoes,—produce, 252 bolls of 8 cwt., or at the rate of 576 bushels per acre. This was a very extraordinary crop; and, considering the worthless state of this field prior to improvement (only grazing two cows and their calves, though 16 acres in extent), went far to liquidate the expense of improvement—if, indeed, it did not reimburse the whole. The second crop of oats from Glenhapple, 1842, and first from Fleming Park—together, 93 acres,—amounted to 486 bolls, or at the rate of 62 bushels per acre; weight fully 40 lbs. per bushel, besides 32¼ bolls of inferior grain. 3. The turnip crop in Glenhapple Park, 56 acres, this season, 1843, is altogether very superior, and the actual weight of the fourth part of an acre which has been taken up, and cleaned of top and root, amounted to 8½ tons (and the crop is equally good throughout the field), thus giving a produce of 34 tons per acre. The quantity of manure applied to this field, per acre, as noticed in the preceding part of this report, may appear extravagant, but we would beg to explain that the quantities stated were applied only on such parts of the field as had not at any former period been under cultivation,—the other portions of the field receiving, per acre, about 16 cartloads of dung, with 3 cwt. of guano, or 25 bushels of bones. The annual rent realised from these 147 acres of Culhorn farm previous to improvement amounted only to 112*l.*, or, on an average, a fraction more than 15*s.* 2*d.* per acre; and we are sure that in estimating the present value at 30*s.* per acre, notwithstanding the current agricultural depression, we are rather within the mark than otherwise. We make these general remarks merely to show agriculturists what can be done by a judicious outlay of capital on a naturally poor, barren soil; and we hope the time is not distant when the intelligent and enterprising tenants, as well as landlords, of Wigtownshire, will find it their interest to apply their spare capital and well-directed energies to the improvement and better cultivation of their farms—thus rendering themselves the benefactors of the district in which they live, by the additional employment thereby given to the labouring classes, who would consequently be enabled to live better and educate their children. We have been led to notice the improvements on Culhorn farm entirely from their being so conspicuous. But as we have already noticed, these are only a speck in the wide field of agricultural improvement entered upon by Lord Stair. His Lordship has land in fourteen parishes out of the sixteen which compose the entire county; and ever since his accession to these estates, the leading operations of permanent improvement—erecting farm-houses and making fences and drains—have been in rapid progress over the length and breadth of his possessions. There are two extensive tile-works on his Lordship's estates—one at the upper, the other at the lower end of the county, at which there are made annually about fifteen hundred thousand drain-tiles, besides a corresponding quantity of soles. Since spring 1840, there has been made at these works, and used on the estates, the enormous quantity of *three millions one hundred and sixty-four thousand five hundred and twenty-eight drain-tiles*,—these tiles are each fourteen inches in length; and when we apply the foregoing quantity in lineal measurement of drain finished therewith, we bring out a total of upwards of *six hundred and ninety-nine miles of drains*,—besides many miles that have been finished with broken stones previous to the erection of the second tile-work; and all this within *the short space of three-and-a-half years*. Lord Stair has thus not only set an example to his tenantry and the agricultural district at large, by the recent improvements on his home farm, but in the spirit of genuine liberality has kindly placed within the reach of his tenants, great and small, an opportunity of experimenting for themselves. Three experienced drainers have very properly been selected and placed in different quarters to take the entire management of the drainage on the estates—not leaving so important an operation to uncertainty, or to individual caprice or fancy, but securing what is both necessary and prudent, the proper execution of the work. The practice on the Stair estates therefore is, that the proprietor pays the whole expense of the drainage and charges 5 per cent. per annum on the outlay. The ground work of a better system of husbandry has thus been laid by Lord Stair for his tenantry; and it is particularly gratifying to see the happy results of such a course in the more extensive green crops now cultivated,—and these certainly of a decidedly superior quality to what could be formerly raised under any management however good. [The Scotch acre alluded to above is ¼ larger than the Imperial acre.]—*Wigtownshire Free Press.*

The Duke of Cleveland on Leases.—At an agricultural meeting the other day, the Duke of Cleveland said, within three miles of the place where he had resided for the last nine years was a place which had long been rented as a rabbit warren; a spirited farmer acquainted with it applied to Sir William Welby, and said if he could have a lease for 14 years that he would break it up and bring the land into cultivation, his rent being allowed to remain at the same amount as that paid by the warrener. This offer was accepted, and the farmer being satisfied that the undertaking would ultimately repay him, entered with spirit upon it. In the fourth or fifth year after the warren was broken up, he (the Duke of Cleveland) saw this farm, and he could testify that it was bearing the best crops in the county; and last year, in the month of July, he again saw it, and would not wish to behold finer crops of Wheat, Barley, and Oats, than those which he witnessed growing upon this very farm. (Applause.) This showed what could be done by a spirited farmer. At the end of four or five years after he entered on the cultivation of this farm, the tenant applied to his landlord to erect suitable buildings upon it. Sir W. Welby observed that the rental was so small, that he could not be expected to incur an outlay of that description. This farmer, however, not having the necessary confidence in a lease of 14 years to induce him to erect the necessary buildings, made an offer, that if his landlord would extend it from 14 to 21 years, he would build himself a complete range of buildings. This was agreed upon, and a better and more perfect set of buildings could not be seen than he had erected. Now, the tenant would no doubt be amply repaid for his outlay; the landlord, although he would have to wait so many years before he took any advantage from the improvement, would ultimately find his farm trebled or quadrupled in value.—*Chester Chronicle.*

The comparative Advantage of Opening Drains with the Spade and Plough.—At the second monthly meeting of the Stirling Agricultural Improvement Club, Mr. Alexander, farmer, Taylorton, read a paper on the above subject, and after a good deal of useful and interesting discussion it was unanimously resolved, "That in general cases the plough is preferable to the spade for opening drains, both as regards expedition and economy." Mr. Alexander stated that with the drain-plough he could drain 40 acres in the almost incredibly short space of four days, and that too with such exactness, that manual labour is scarcely necessary, save for the purpose of placing the tiles in the drains. He stated that the reduced rates at which drains can be opened with the plough, compared with those done with the spade, might be estimated as follows:—An ordinary day's work of both ploughs going at the same time can accomplish 10 Scotch acres; and the

ridges being 15 feet broad, the length of drains in that extent of land will be 490 Scotch chains:—

The expense of opening 490 chains with the spade, say 7d. per chain, is		£14 15 10
Same number of acres at the plough		
Horses required for plough, 12 pairs, at 6s. per pair, with drivers, is	£4 16 0	
Four holders, at 2s. each	0 8 0	
Average expense of cleaning and entering the drains into the main levels, 2s. per acre		
Ten acres, at 2s.	1 0 0	
Allowance for tear and wear, 20s.	1 0 0	
		7 4 0
Balance in favour of the plough		£7 11 10

showing a difference of about one-half, after due allowance for horses, which upon a kerse (i. e., an alluvial clay) farm have not constant employment at ordinary farm work in the proper season of the year for draining. Plough-draining has been in operation to a certain extent for a good number of years, but the prevailing notion that none but extra-sized horses, accustomed to work together, would be of any value for that work, prevented the plough from becoming an implement of general use. Mr. Alexander was the successful candidate for the premium of 20*l.* offered by the Highland and Agricultural Society for the best drain-plough.—*Scotch Paper.*

Sources of Labour.—The value of labour, like that of all other commodities, is regulated by the demand; it is the principal outlay of a farmer, for which he expects a return, and of course he is not likely to give 10s. for what he can get at 8s. Would a manufacturer, or, indeed, any man of business practise in their trades such liberality? Business and charity are distinct, and men generally devote to the latter in proportion as they realise by the former; they do not unite the two. The grand principle is to increase the demand for labour, and then—and not till then—you will increase its value; that there is abundant and profitable employment for every individual in this kingdom there can be no doubt, even though the population were double what it is; we only want our countrymen to entertain correct views of the subject, and to act upon them. Notwithstanding draining has become so hackneyed a subject, it is by no means generally practised; this is the more to be regretted, as land which suffers from water is the most productive we have, and when freed from the excess of water will carry more luxuriant crops than drier soils. This I consider a landlord's outlay, on which the tenant should pay an interest. A general system of drainage would very much increase the demand for labour for a time, and the breaking up the thousands of acres of poor and comparatively worthless pastures we have in this country, would yield a permanent and prolific source of employment, and this all landlords have in their power, without inconvenience to themselves. I know some individuals say they have not sufficient confidence in their tenants to allow of this; my only reply to which is, the sooner such a connexion is broken the better, as no good can result except with the mutual confidence of landlord and tenant. We are now sending our ships to the coast of Peru for manure, while we have a most abundant source within our own shores, which instead of nurturing food for man, we allow to stimulate the growth of vegetables for frogs and such-like reptiles. I allude to the immense waste of manure from the sewerage, &c. of our towns, which if preserved would be of great advantage to the country, and be another most profitable source of labour.—*Ed. Bowley, Gloucester Journal.*

Proposed Agricultural Colleges.—The establishment of Agricultural Colleges and Example Farms in different districts of the kingdom is now engaging the attention of some of the leading Agricultural bodies. It is proposed that in these Colleges or Agricultural Seminaries young men intended for Agricultural pursuits shall pursue a course of study combined with practical illustrations of the science and practice of Agriculture, so as to fit them for obtaining situations in the service of landed proprietors, as stewards, or for carrying out at home correct principles of Husbandry and Farming. It is intended that the in-door establishment shall consist of a head and second master, who shall instruct the pupils in the elements of education, together with land-surveying, the use of the water-level, the theodolite and chain, and everything applicable to Agricultural pursuits. With a view of rendering them practical farmers, every pupil is to be made a ploughman, and to be taught not only how to use the plough, but how to settle the irons for every soil, and all kind of work. Their attention is also to be turned to stock of all descriptions, and to the making and repairing of fences. Lectures are to be delivered by head farmers on the Practice of Agriculture, explaining the reasons for adopting any particular crop or rotation of crops; also, on the breeding, feeding, and proper management of stock, the drainage, reclamation, and improvement of land, and the invention and proper application of Agricultural implements.

The Necessary Capital for a Farm.—"Let no one venture on a Farm," says Mr. Low, "without having a sufficient capital to work it, which from long experience I compute to be about 6*l.* per acre; that is, 900*l.* money in hand if his Farm be 150 acres. The following five will be the heads of his certain expenditure for the first year:—1. Implements, 1*l.* per acre; 2. Live stock, 3*l.* per acre; 3. Labour, 1*l.* per acre; 4. Seeds and manure (which last he must take of the outgoing tenant), 1*l.* per acre; total, 6*l.*"

Spade Husbandry.—In 1831, Mr. Scott, an East Lothian farmer, resolved upon ascertaining the difference in expense between summer-fallowing with the plough, and trenching with the spade. "I, therefore," says the experimenter, "trenched thirteen acres of my summer allow break in the months of June and July. I found the soil about fourteen inches deep, and I turned it completely over, thereby putting up a clean and fresh soil in the room of the foul and exhausted mould which I was careful to put at the bottom of the trench. This operation I found cost about 4*l.* 10*s.* per Scotch acre, paying my labourers 1*s.* 6*d.* per day. The rest of the field, which consisted of nine acres, I wrought with the plough in the usual way, giving it six furrows, with the suitable harrowing. I manured the field in August; the trenched got eight cart-loads per acre, the ploughed land sixteen; the field was sown in the middle of September. The whole turned out a bulky crop as to straw, particularly the trenched portion, which was much lodged. On threshing them out I found them to stand as under:—

By trenched Wheat per acre, 52 bushels, at 6s. 9d.		£17 11s. 0d.
To two years' rent, at 2*l.* 10*s.* per acre	£5 0s. 0d.	
To expense of trenching	4 10 0	
To seed, three bushels, at 6s. 9d.	1 0 3	
To eight cart-loads manure	1 12 0	
To expense of cutting, threshing, and marketing	1 10 0	
Profit	3 18 9	
		17 11 0
By ploughed Wheat per acre, at 6s. 9d. per bushel		14 3 6
To expenses of cultivation, &c.	£13 14 3	
Profit	9 3	
		£14 3 6

* Is it not possible that some such plan might be put in extensive and active operation? We hear much of the advances of our capitalists made to repudiating states, and for forming foreign railways. The chances of their ever being repaid appear somewhat remote. Here is a plan for the investment of capital which promises a fair return, and would, undoubtedly, if put in operation, prove a blessing to thousands who are now in a state of extreme poverty.—*Correspondent of the Morning Post.*

Concrete Tiles.—There are two methods of manufacturing concrete tiles, on the principle recommended by Lord John Hay; the one is to construct the tile on the land, and then place it carefully in the bottom of the drain; the other is to make it in the drain as it is formed, and have it immediately covered up. The ingredients, with their proportions, are as follows:—One ton of lime, half a ton of blackened cinders, four tons of common sand, two tons of fine gravel. This will be found sufficient to make between 2,000 and 3,000 tiles at an expense, including workmanship, of about 2*l.* Mr. Smith, of Deanston, recommends that the gravel and sand should be ground together in a wet state, as the lime goes much farther, and the mixture is much better prepared for the process of manufacture.—*Ayrshire Agriculturist.*

Notices to Correspondents.

Agreement for Lease.—*N. I.*—You cannot successfully defend the ejectment brought by your landlord. The agreement, being for more than three years, should have been in writing. If, however, you have laid out considerable sums of money in permanent improvements, upon the faith of the agreement, you may probably have a remedy in equity.

Alluvial Inclosures.—*S.*—We have received your letter and box, inclosing samples of soil, &c., but cannot undertake to analyse specimens sent to us. This could not be done under an expense of from 1*l.* to 6*l.* per specimen. We are thus unable to state the quantity of common salt which there may be in your soil. Reasoning, however, from analogy, we should not suppose that there was an injurious quantity of it present. We shall answer your other questions next week.

Farmers' Clubs.—*J. P.*—We shall be ready to announce weekly these meetings, if the Secretaries will favour us with the necessary information.

Mouldy Hay.—*A Gardener and Farmer.*—Mouldy provender is bad for cows. We understand benefit has been derived from steaming such provender. Cut it into chaff, and mix it with some better stuff.

Poor-rate Appeal.—*F. M.*—You must pay the amount assessed on you, although you appeal. The amount paid will abide the event of the Appeal.

Tile Machine.—*An Old Subscriber* should examine Etheridge's patent tile-making machine.

Miscellaneous.—*A Lancashire Farmer.*—Thanks; not suited, verging on politics.

Markets.

Mark Lane, Friday, January 5.—Notwithstanding the change in the weather the market for English Wheat was quite as good as on Monday: on Wednesday there was a large sale of free Foreign at full prices, and although offered at the same rates to-day the business done was limited; there is still some inquiry for bonded. Malting Barley continues in demand at Monday's quotations, and other sorts go off freely. Grey Peas are 1*s.* dearer, and White remain the same. Beans are fully as dear; Oats are 6*d.* higher than on Monday, and about the same as on Wednesday.

				— Inferior	—	— — —
				Pigs	3	6 4 0

Numbers—2760 Beasts; 23,200 Sheep; 84 Calves

Remarks—(Monday)—The supply of Beasts and Sheep being very moderate, and the weather good, trade was brisk at an increased price of from 2d to 4d per stone of 8lb, and fully realised the quotation.

Farney, Jan 5. 1844.—795 beasts; 3,740 sheep; 120 calves. The weather having become mild, and the supply of beasts increased, beef-trade is slower at a reduction of full 2d to 4d per stone, from Monday's prices. Mutton-trade is cheerful, at an advance of 2d per stone. Veal and Pork Monday's prices.

Hay, Smithfield, Jan. 4.

Hay, 2*l* 10*s* to 3*l* 10 | Clover, 3*l* 10*s* to 4*l* 10*s* | Straw, 1*l* 4*s* to 1*l* 8*s* Per Load of 36 Trusses. John Cooper, Salesman.

Covent-Garden. *Jan.* 5.—In consequence of the continued fine weather, the Market has been well supplied during the week with vegetables of almost every kind. The supply of fruit has not been quite so plentiful, but still sufficient to meet the demand. Pine-apples are selling at nearly the same prices as last week; although small, they are good in quality, and sufficient to meet the demand. Hothouse Grapes have not advanced in price since our last report; they are rather scarce; Portugals are good and plentiful. The supply of Apples has not been quite so plentiful as last week, and they are rather inferior in quality. Pears have not advanced in price since our last report; good specimens of Ne plus Meuris and Glout Morceau are offered at 4*d.* each. Oranges and Lemons are plentiful. Pomegranates are selling at 6*d.* each. There has been little alteration in the prices of Vegetables during the week. Cabbages are good and plentiful. Broccoli is not so plentiful as last week. Brussels Sprouts are abundant, and are offered at the same prices as last week. Seakale is selling at from 1*s.* to 3*s.* per punnet. Some excellent Rhubarb has been brought to the Market during the week; it is offered at from 1*s.* to 1*s.* 6*d.* per bundle. Asparagus is good and plentiful. Parsneps are selling at from 6*d.* to 1*s.* 6*d.* per dozen. Parsley, Endive, and Shallots, are offered at the same prices as last week. Cut Flowers are chiefly composed of Erica hyemalis, gracilis, and arborea, Cypripedium insigne, Bignonia venusta, Euphorbia jacquiniflora, Lechenaultia formosa, Garrya elliptica, Poinsettia pulcherrima, Camellias, Chrysanthemums, Primulas, Fuchsias, and Roses.

Fruits.

Pine Apple, per lb., 4*s* to 7*s*	Red Capsicums, 4*s* to 8*s*
Grapes, hothouse, per lb., 3*s* to 7*s*	Almonds, per peck, 6*s*

Potatoes, per ton, 40*s* to 75*s*	Walnuts, per bushel, shelled, 12*s* to 16*s*
— per cwt., 2*s* to 4*s*	Small Salads, per punnet, 2*d* to 3*d*
— per bushel, 1*s* 6*d* to 2*s* 6*d*	Watercress, per doz. sm. bun. 3*d* to 6*d*
— Kidney, p. bush., 2*s* to 2*s* 6*d*	Parsley, per doz. bunches, 2*s* to 4*s*
Turnips, per doz. bunches, 1*s* 6*d* to 2*s* 6*d*	Tarragon, per bun. 2*d* to 3*d*
Red Beet, per dozen, 6*d* to 1*s*	Endive, per score, 9*d* to 2*s*
Horse Radish, per bundle, 1*s* to 3*s*	Mint, per doz. bunches, 1*s* to 2*s*
Radish, spring, p. doz. hands, 1*s*	Marjoram, green, p. doz. bun. 1*s* 6*d* to 2*s*
Carrots, p. doz. bun., 2*s* 6*d* to 3*s*	Chervil, per punnet, 2*d* to 3*d*
Spinach, per sieve, 1*s* 6*d* to 2*s* 6*d*	Salsafy, per bundle, 1*s* to 1*s* 6*d*
Leeks, per doz. bun., 9*d* to 1*s*	Scorzonera, per bundle, 1*s* 6*d*

Hops, Friday, Jan. 5.

The Hop Market for the season is more active than it has been for many years past, and prices continue to advance; the general opinion is they will go much higher, as the stock on hand seldom has been so small at this period; full three-fourths of the growth have already found buyers, and the remainder are held firmly by the planters for better prices, consequently we have but few in offer at the following currency.

Kingsford and Lay

Wool.—British, Friday, Jan. 5.

In the English wool market during the past week no material alteration has taken place. Things continue firm, with a tendency upwards in price. Any thing like advance in price is resisted by the manufacturers, and as they in some cases hold good stocks of wool, we do not think that a permanent advance will be obtained, nevertheless the present demand is sufficiently good to keep prices as they now are for some time.

James Perrin, Wool Broker.

AGRICULTURAL TABLES.—Just published, 12mo, price 2*s*. 6*d*. STRAHAN'S NEW SET OF TABLES, for computing the Weight of Cattle by Measurement; the Quantity of Hay in Ricks of different Forms; the Value of Land, &c.; the Measurement of Drains and Dunghills. Also a few other Practical Tables, with Rules, Examples, and Directions for using the Tables. Second Edition, revised and improved. OLIVER & BOYD, Edinburgh. SIMPKIN, MARSHALL, & Co., London.

Nearly ready, in demy 8vo., cloth, price 5*s*.

BEADS FROM A ROSARY. By T. WESTWOOD.
Author of "Miscellaneous Poems."
London: SAMUEL CLARKE, 13, Pall Mall East.

TWENTY YEARS' LOSS OF HAIR and WONDERFUL RESTORATION. Church-street, Whitby, Oct. 19, 1841.—Gentlemen—Of the last supply of OLDRIDGE'S BALM OF COLUMBIA every bottle was sold immediately on receipt, and I have many more bespoke, only waiting for a further supply, which I hope you will send without the least delay. Orders have poured in more than ever since the powerful effects of the Balm have been so decidedly demonstrated in the cases of several credible and respectable inhabitants of the town. One instance, among others which have attracted particular attention, is the case of a gentleman who had had little or no hair for twenty years: he had tried numerous preparations in vain, and ultimately had his head shaved and wore a wig. At my recommendation he tried the Balm; and after using it according to the directions for a short time, the young hair appeared, and he has now as fine a head of hair as any person in Whitby.
Yours, &c., JOHN KILVINTON.
To Messrs. Kennaby, Brothers, 10, Westmoreland-buildings, Aldersgate-street, London.

OLDRIDGE'S BALM prevents the hair turning grey, produces a beautiful curl, frees it from scurf, and stops it from falling off; a few Bottles generally restore it again. Price 3*s*. 6*d*., 6*s*., and 11*s*. per Bottle. *No other prices are genuine.* Ask for OLDRIDGE'S BALM of COLUMBIA, 1, Wellington-street, Strand.

GLASS SUPERSEDED for HORTICULTURAL PURPOSES by WHITNEY'S CHEMICAL TRANSPARENT WATERPROOF COMPOSITION, rendering Muslin, Calico, or Linen, for the Frames of Greenhouses, Pine, Melon, or Cucumber Stoves, &c., impervious to rain or moisture, admitting light equal to Glass, much warmer, and the plants never burn under it.

Noblemen, Gentlemen, and Gardeners will, by using this composition have the only effectual protection for their Fruit-trees during the blooming season; it is a certain defence from frost, sleet, wind, and blight; its transparency admits the general beams of the sun, with abundance of light, which causes the bloom to expand with increased luxuriance, the fruit to set and swell more freely, much earlier, and a crop of fruit to any extent may be warranted. The covering not to be moved by day except to thin the Fruit, which will be necessary), till the month of June. It is recommended that the Calico be prepared early, so as to be thoroughly dry before using.

Sold in Bottles, with directions for use, pints, 2*s*. 6*d*., quarts, 4*s*. 6*d*. each. One pint is sufficient to coat four Frames twice over, each Frame to be 3ft. by 3ft. 3in., or thereabouts. Prepared by GEORGE WHITNEY, Chemist, Shrewsbury. Seedsmen, Florists, and Merchants supplied by Mr. W. BAILEY, Chemist, North-street, Wolverhampton. Appointed Agents:—Messrs. BUTLER and MUCKLEY, Covent Garden, where a sample of prepared calico may be seen; Mr. WATKINSON, Market-place, Manchester, PAGE and SON, Southampton; T. and C. WHALLEY, Nurserymen, Liverpool.

Agents wanted for London and the country.

NEW GARDEN NET 1½*d*. per yard, second-hand do. ½*d*. per yard, quite perfect; Garden Net ½ inch mesh warranted to protect the blossom, 2½*d*. per yard; a fibrous Hemp Net, New Hemp Net, 36 meshes to an inch, 7½*d*. per yard; Worsted and Woollen Nets, Net to fence out Hares and Rabbits, 2*d*. per yard, tarred; Tarpauling Frame Pit and Greenhouse Covers, 1*s*. per square yard; Long Hare and Rabbit Nets on Cords, 50, 80, and 100 yards long. Upwards of 1000 London Policemen's Capes, 2*s*. and 2*s*. 6*d*. each for Labourers, Gardeners, and Farm-servants. Flags, Banners, &c.

TO FARMERS.—Sheep Net nearly 4 feet high, 4½*d* per yard, of strong cord; Rick Cloth dressed with a pliable composition of Tar and boiled Oil, which never mildew or are touched by vermin, as follows:—for 20 tons of Hay, 30 feet by 30 feet, 5*l*.; 40 tons, 36 feet by 30 feet, 6*l*. 10*s*.; 50 tons, 36 feet by 46th, 7*l*. 10*s*. complete with side lines. Early orders are respectfully solicited for these Rick Cloths to prevent disappointment. Dressed Waggon and Hay Cart Cloths. Expanding Tents (the only maker) for Lawns, &c., 36 feet round, 6 feet high in the lowest part, 5*l*.; 42 feet round, 6*l*. 10*s*.; 24 feet round, 4*l*., put up or down in a few minutes, and require no side-lines. Fishing Nets of all kinds. Nets to cover in Pheasants, Poultry, &c. 2*d*. per yard. Nets made to order. ROBERT RICHARD, Jun., Net, Tent, and Rick Cloth Maker, 21, Tonbridge-place, New-road, corner of Judd-st. London.

TO ARTISTS, AMATEURS, ETC.
WOLFF & SON'S CRETA LÆVIS, or PERMANENT DRAWING CHALK, in various Colours.

E. WOLFF & SON beg to apprise Artists and Amateurs that they have, by the introduction of great improvements in their CRETA LÆVIS, enabled it to be used the same as the ordinary pencil; and effects can now be produced equal to water-colour drawings, without the use of water or any other fluid, the various colours blending together with perfect harmony, beauty, and richness. It can be cut to a fine point, and is thus capable of giving a very delicate outline. For sketching from nature, the great advantages resulting from the adoption of the CRETA LÆVIS must be obvious, as without the use of water, palette, brushes, &c. all the various tints can be obtained with a truthfulness that cannot be surpassed.

"*Creta Lævis.*—Preparations of drawing chalk in various colours, and some specimens of works produced by them, have been submitted to us by Messrs. WOLFF & SON. These specimens we had no hesitation in pronouncing powerful and effective; but we thought it right to forward the material itself to one more competent than ourselves to offer an opinion, and he reports favourably of it—that it is well suited for sketching, as it enables the artist to give colour as well as outline, which does not rub off in the portfolio."—*Athenæum*, Dec 23.

Instructions for Use.—To produce the delicate shades, the chalk must be cut to a fine point, and worked very lightly on the paper, blending the colours until the required tint be obtained. The deep shades merely require a broader point and increased pressure.—Bristol Board, Crayon Paper, or, in fact, any papers with a fine even surface, but not glazed, are well adapted for the CRETA LÆVIS.

WOLFF & SON beg to recommend their newly-invented SKETCHING PENCILS, or Permanent Black Chalks:—
B B, Very black, for the foreground.
H B, Middle tint.
N, Neutral tint, for distance.

These Pencils are peculiarly adapted for sketching heads and landscapes, and are capable of producing a beautiful effect with very little labour. Having an adhesive quality, the drawings may be transmitted without fear of injury.

*** WOLFF & SON are desirous of opening an Agency with respectable Country Booksellers and Stationers, for the sale of the above.—Manufactory, 23, Church-street, Spitalfields, London.

BY HER MAJESTY'S ROYAL LETTERS PATENT.

PATENT ASPHALTE ROOFING.

THE above Material has been used and approved by the Nobility, Gentry, and Agriculturists generally, as a Roofing and Covering to sides of Farm Buildings; its advantages are—Lightness, Durability, and Economy. Being a non-conductor, it has been proved an efficient "Protective Material" to Plants, and is now in use at the "Royal Horticultural Society's Gardens, Chiswick." It can be had of any length, 32 inches wide, at 1*d*. per foot, super. A discount to the trade.
THOS. J. CROGGON, 8, Ingram-court, Fenchurch-st., London.

70, STRAND.

RAMS FOR RAISING WATER WITHOUT LABOUR.

FOUNTAINS of every description. Specimens of the Fountain to be seen at the above address. Also a Ram fixed on the premises. F. ROE, 70, Strand, London.

Every kind of Garden and other Pumps.

THE URATE of the LONDON MANURE COMPANY, 5*l*. per Ton. It is with the greatest satisfaction, after three years' experience, the Company are enabled to recommend the above as one of the best manures for Barley, Oats, Spring Wheat, and more especially Turnips. By promoting a rapid growth of the latter it secures a full plant, at the same time produeing a great weight per acre, and extending its beneficial effects to the succeeding crops. The Urate may be sown broadcast, or which is preferable, by the drill, at the rate of one ton to three acres, and it is desirable it should not be placed more than two inches below the surface. As a sopdressing for Wheat the Urate has been used with great advantage. Gardeners and Florists will find it very useful for Dahlias and other roots. Full particulars and Testimonials will be forwarded on application. Genuine Peruvian Guano; Phosphate and Sulphate of Ammonia; Gypsum and every other artificial Manure.
EDWARD PURSER, Secretary, 40, New Bridge Street.

TO GARDENERS AND AGRICULTURISTS.

SUPER-PHOSPHATE of LIME is capable of producing a more rapid vegetation in Plants than any substance known. It may be had at Mr. LAWES' Factory, Deptford Creek, price 7*s*. per cwt.

Phosphate of Potash	. . .	15*s*. per cwt.
,, Soda	. . .	12*s*. ,,
,, Magnesia	. . .	9*s*. ,,
,, Ammonia	. .	1*s*. per lb.

GENUINE PERUVIAN & BOLIVIAN GUANO
ON SALE, BY THE IMPORTERS,
ANTONY GIBBS AND SONS, LONDON;
GIBBS, BRIGHT, AND CO., LIVERPOOL AND BRISTOL.
47, Lime-st., Jan. 5, 1844.

ON SALE, in any quantity, PERUVIAN and BOLIVIAN GUANO, genuine as imported,—Apply to COTESWORTH, POWELL, and PRYOR, London; EDWARDS, DANSON, and Co., Liverpool; or WILLIAM J. MYERS and Co., Liverpool, the Importers

MANURES SUPPLIED IN ANY QUANTITY.

Animal substance	Guano
Bones	Night-soil
Bone dust	Saltpetre
Feather dust	Nitrate of soda
Trotter stuff	Salt
Seal-skin clippings	Wood-ashes
Horn shavings	Coal-ashes
Whalebone ditto	Cockle-shells
Woollen rags	Salt marsh peat
Thoddy	Muscles
Woollen waste	Sprats
Horse-dung	Five Fingers
Cow-dung	Oyster-shells

The above MANURES to be had genuine, in any quantity, by orders sent to W. CHARD, 19, Sidney-street, Commercial Road East, London.—Sent to any part of the United Kingdom.

POTTER'S GUANO MANURE.—The Proprietor thinks it needless to say a word in recommendation of the above Manures; he merely solicits attention to the following testimonials.

EXPERIMENT ON MEADOW, BY THE EARL OF ZETLAND.
Soil—rich old land, resting upon limestone rock, Aske, 1842.
The following was the weight of HAY produced, viz.:—

		ton cwt.qr.				cwt.qr.

Guano, 2 cwt. per acre	Do.	1	18	0	Do.	8	2
Am. Phosphate	Do.	1	12	0	Do.	2	2
POTTER'S MANURE, 2 cwt. per acre	Do.	2	8	0	Do.	18	2

Richmond, Dec. 2, 1842 (Signed,) H. I. TURNER.

TESTIMONIAL FROM A. COTTON, ESQ.—"POTTER'S GUANO MANURE was applied with great effect to a light land on the estate of *A. Cotton, Esq., Hildersham Hall, Cambridge*. On a field of *Barley*, it produced marked effect,—the finest crop for years, and the produce Six Quarters of Barley to the acre.—The space marked out was conspicuous, being some inches higher than that from common manure. On part of a *Grass Field* the application, which was but lightly made, produced at *least double the proportion of* HAY compared to the part otherwise manured. A portion of it was applied to the *Orange Globe Mangold Wurtzel*, the produce of which was of very large size, double that of others, and its effects on a bed of *Parsnips* was extraordinary, producing a crop exceeding any before seen.

* I add a letter received from Mr. Cotton, in November, 1842.

"Mr. Cotton informs Mr. Potter, that the Guano has arrived at Hildersham—Mr. Cotton has just taken his Mangold Wurtzel up, part of which was manured with Potter's Guano, the rest with Farm-yard manure; a square yard of each was weighed, that with his composition weighed 40 lbs., the other 27 lbs."

* It will be found, by multiplying the result of Mr. Cotton, by 4,840 (the number of square yards in the acre) that the yield amounted to nearly 87 tons.

DR. LINDLEY says, in the *Gardeners' Chronicle, Aug.* 26, 1843, "From the first appearance of the Manure called POTTER'S GUANO, we have expressed an opinion that it would necessarily prove one of the most useful of fertilising agents; and experience proves us to have been right. In addition to the published accounts of last year we are now able to state that on Asparagus and other Kitchen Garden produce, its action has been most beneficial during the summer. Little worn-out suburban gardens, where, for obvious reasons, manure cannot be applied, have been *restored to fertility by two or three dressings*; and have been *crowded with flowers* where plants could scarcely grow at all before. We are therefore glad to find that Potter's Guano has experienced such a reduction in price as will induce both Farmers and Gardeners to avail themselves of it."

Potter's Guano, continued.

"Potter's Guano is excellent for Meadow Land."

"One great advantage of Potter's Guano over Peruvian Guano is, that it is of *uniform* quality, which the latter cannot very well be."—*Gardeners' Chronicle, Aug.* 26, 1843.

The following are extracted from the same journal of this year, August 19th. In the Horticultural Gardens, near London, Potter's Guano was used with *Asparagus*, dissolved in water, the plant of a dark green, and "*particularly vigorous*" The Peruvian Guano used at the same time did not produce so good an effect.

At page 577.—"No kind of manure is better adapted for poor soils than Potter's Guano." At page 560.—"You cannot employ a better substance than Potter's Guano; it will convert your desert into a paradise." At page 464.—"We are inclined to think Potter's Guano amongst the most powerful and manageable agents known." At page 376.—"The best liquid manure for Gardens is Potter's Guano, mixed with water." At page 161.—"Try Potter's Guano against the foreign." At page 57.—"For your Beans, try Potter's Guano mixed with two or three times its bulk of cinder-siftings, peat mould, black earth, or any such substance." At page 632.—"2 cwt. per acre of this manure, (Potter's Guano) will be found excellent for *any field crop*."

Mr. E. H. FULLER, Florist of Worthing, September 1843, says—"I have tried your GUANO upon *Geraniums* with great success."

Mr. Brock, of *Barking*, used it for Celery on the *latest* row he planted, which nevertheless was the first for use, and the finest in his garden.

The following notice is added from *The New Farmer's Journal*:

POTTER'S GUANO.—"This excellent composition has now obtained a character which places it in the very first rank of chemical fertilisers; and on *Wheat-lands* in particular will be found a most efficient manure."

From a letter dated Lynn, July 24th, 1843.—"The sample sack sent is sold to one of our first Agriculturists, *who approves much of it.*"

From a letter dated Pembury, July 7th, 1843.—"It appears to me your GUANO is pressing *Wheat* into a great tube."

From a letter dated Sherbourne, June 2nd, 1843.—"I hear very good reports of the GUANO you sent me."

From a letter dated Newton House, Bedale, Yorkshire.—"Having used much of your GUANO, and at all times been successful with it, I recommend it to my friends and neighbours."—*August 8th,* 1843.

From a letter dated Salisbury, July, 1843.—"A gentleman that I sent 17 cwt. of your GUANO to is very much satisfied with it; he has tried it upon different crops, and in different ways, and has promised to give me his testimonials of it."

From a letter dated Lewcombe Rectory, near Dorchester, Aug. 29th, 1843.—"The trial I gave your GUANO, last year for *Turnips* was quite satisfactory."

From a letter dated Londonderry, Aug. 29th, 1843.—"I am happy to inform you that some of the gentlemen who have tried it (POTTER'S GUANO), have called in, *unsolicited*, to tell me of its success."

From a letter dated Dundee, July 26th, 1843.—"I have the pleasure to inform you that your GUANO has had a decided action upon Grass and also Turnips."

From a letter dated Cambridge, July 24th, 1843.—"The piece of *Turnips* sown with POTTER'S GUANO is now a fine crop." "A piece next this, sown with *Foreign* Guano has *totally failed*, and has been ploughed up and re-sown."

From a letter dated May 23, 1843 (from the Rector of Burnham Thorpe.)—"I sowed your GUANO broad cast after the *Wheat* was in. It now looks like Wheat dressed with saltpetre, and certainly has got together very much."

Extract of a letter from the Rev. G. Wilkins, Wix, inserted in the Gardeners' Chronicle of Oct. 1, 1843.—"I determined to give Potter's GUANO a fair trial for WHEAT. The result has in every respect answered my expectations. During the whole year the crop on the part dressed with Potter's Manure had the advantage over that dressed with common manure, and towards harvest it was very visibly superior, as was evident to all who saw it, *being thicker on the ground*, the straw longer and firmer, and the *ears much larger, fuller, and heavier.*"

From the Maidstone Journal, Oct. 31, 1843.—"It was stated at an Agricultural Meeting in this neighbourhood, that Potter's GUANO was *preferable* to the natural, as there was *no danger of its being adulterated.*"

From a Londonderry Paper, Oct. 1843.—"This valuable manure (POTTER'S GUANO), the efficacy of which is now fully tested, is very remarkable we understand, in its effect on the production of WHEAT. It has given general satisfaction to the gentlemen and Farmers who made use of it last year—producing a yield beyond their most sanguine expectations."

From a letter dated Cambridge, Oct. 3, 1843:—"Bones, Farm Manure, and your GUANO have been tried together (on TURNIPS),—all look well, *but yours is certainly best.*"

From a letter dated Dartford, Oct. 3, 1843:—"My friend told me he had tried your GUANO for TURNIPS, and liked it very well, on a field where five other compositions were also tried. He considered it had the advantage over the Natural Guano in being *uniform* in its strength, while that was *uncertain.*"

From a letter dated Bath, Sep. 3, 1843:—"Sir, I purchased of Mr. Fothergill half a ton of your Manure last January, and have every reason to be satisfied with the results."

From a letter dated Bridgend, Oct. 5, 1843:—"The crop grown with your GUANO *is far superior* to that which was manured with Urate." "*I believe your composition to be very far superior* to any other artificial manure I have met with."

From a letter dated Exotic Nursery, Canterbury, Oct. 13, 1843:—"I have now tried your Mixture with many crops, and with unequal success, but upon the whole I give it my sanction, because it is *certainly of great value* as a Manure for WHEAT *unaided by other mixtures*, and for GRASS, TURNIPS, CABBAGES, BROCCOLI, &c."

Result of an experiment on WHEAT, near *Colchester*; soil light, sown November 1842, reaped August 1843:—

	Cost of manure per acre.	Produce in Grain.	Produce in Straw.
POTTER'S GUANO*	£2 19 6	54¾ Bush.	32 cwt.
Daniell's Manure .	3 0 0	46 Bush.	31¼ cwt.

* The quantity applied was 3¼ cwt. per acre, which can now be bought for 2*l*. 2*s*.

From a letter dated Shepton Mallett, Oct. 19, 1843:—"Sir, In answer to yours respecting your GUANO, I beg to inform you that I find it a *most excellent manure* for the Kitchen and Flower Gardens, and for Greenhouse Plants of every description."

"I assert without hesitation that there were no crops in this neighbourhood equal to those in my Kitchen-garden; and the effects upon the Flower-beds and borders were perfectly astonishing. Although the season was unfavourable, scarcely any of my annuals failed, and the number of plants was quite double what could reasonably have been calculated upon. This was owing to the use of POTTER'S GUANO, which I received last Nov. (1842) just as I was making up my *Pansy*-beds. I used it upon them, and although my Flowers were late, they were nearly all *much larger than I ever had them before*, and *remained in full bloom longer than I ever recollect.*"—*John Ritson, Sunderland.*

POTTER'S GUANO, also his CONCENTRATED LIQUID GUANO, can be had of most respectable Druggists and Seedsmen throughout the kingdom. The LIQUID GUANO, for Flowers, Bulbs, and Horticultural purposes generally, is sold in Quart Bottles, with full Directions, at 1*s*. 9*d*. each. The Quart will make about 80 Gallons of Liquid Manure of the proper strength.

*** *The Original Letters, from which these quotations are taken, lie at the Works for Public inspection; and the doubting are respectfully invited to convince themselves of their authenticity.*

23, UPPER FORE STREET, LAMBETH, LONDON (at the water-side between Lambeth Church and Vauxhall Bridge.)

TO THE NOBILITY, GENTRY, NURSERYMEN, and GARDENERS.—Extensive SALE at Thelwall Lower Gardens, near the Newton Station on the Liverpool and Manchester Railway.—On MONDAY and TUESDAY, the 15th and 16th January, 1844, will be sold by Auction, by Mr. THOMAS LAMB, at the above Gardens, 1,000 FINE PLANTS, of the best kinds for the greenhouse, conservatory, and flowering Pots, 250 Specimen, and 150 Stove Plants, perfectly clean and healthy; 178 Vines, from one to five years old, worthy of notice; a great variety of Pine and Greenhouse Plants, Hardy Shrubs, Thorns, Pines, and Forest Trees, for hedging; Apple, Gooseberry, Currant, and other Fruit-Trees, &c. &c. Also, three well-bred, in calf Cows, Two Stacks, Hay and Straw. Pigs, Sow in pig, Rick of excellent Hay, a great variety of Farming and Gardening Implements, and a Garden Engine, nearly new. WM. NICKSON, who is changing his residence, respectfully calls the attention of Fine Growers to the above Stock, which will be open for inspection until the day of Sale.

The Farming Stock will be sold on the second day. The Sale to commence each day at eleven o'clock. Catalogues may be had at the Gardens, at the Auctioneer's, and of Mr. WALL, bookseller, Wigan.

Just Published, price 6s. cloth,

THE HAND-BOOK OF CHEMISTRY; with a complete Index of Reference. By G. H. CAUNTER, Esq.
London: W. S. ORR & Co.; and W. & R. CHAMBERS, Edinb

SMOKE PREVENTED AND VENTILATION EFFECTED, BY SPONTANEOUS ACTION.

MR. JEAKES, 51, Great Russell street, Russell-square, Sole Agent in London for the Sale of DAY'S PATENT WIND-GUARD, by the use of which he guarantees to Cure all Chimneys Smoking from Wind, and also to prevent downward currents; it is admirably adapted for the Ventilation of Apartments of every description; also of Shops, Stables, Dairies, and Larders, as it ensures a constant change of air; and all its parts being fixtures, it is free from noise and not liable to derangement; it also offers no impediment to sweeping. Price for general use, 30s.; larger size, 45s.; larger sizes, especially adapted for ventilation, 60s. and upwards. To be had at 51, Great Russell street, where it may be seen in action. The attention of Architects, Builders, and the Trade in general, is especially invited.

WANTED TO PURCHASE, FROM 10 TO 50 ACRES OF LAND, with a good FARM HOUSE, or other moderate residence containing about 12 rooms, with Servants' and other offices. Full particulars, stating nature of soil and subsoil, dimensions and number of rooms, aspect of house, distance from church, amount of rates, taxes, and of purchase money, to be sent free of postage to M. O., care of Mr. PEDLER, 199 Fleet-street, London. Distance from London not to exceed two hours.

TO NURSERYMEN WISHING TO RETIRE FROM BUSINESS.

WANTED to Purchase or Hire, an Old Established Nursery in London or its vicinity, where a good business has been carried on.—Letters addressed to C. F. L., *Gardeners' Chronicle* Office, 3, Charles-street, Covent garden, will meet with immediate attention.

Price 7s., Illustrated with Wood-cuts of Birds, Cages, &c.

NATURAL HISTORY OF CAGE BIRDS; their Management, Habits, Food, Diseases, Treatment, Breeding, and the Methods of Catching them. By J. M. BECHSTEIN, M.D.
London: W. S. ORR and Co.; and W. R. CHAMBERS, Edinburgh.

NEW FARMERS' NEWSPAPER.

The time has come when Landlords and Tenants, large Farmers and small, must devote their anxious attention to improved cultivation—when, in the words of Sir Robert Peel, "*All must learn how, in the shortest time, and at the least expence, to produce the greatest quantity of food, vegetable or animal, without permanent injury to the land.*" To accomplish this, no means can be so effectual as that which brings the results of Experience and Science before every man, in a cheap form. For this purpose THE AGRICULTURAL GAZETTE is to be established.

The Proprietors are aware of the difficulties of dealing with the many details of cultivation without an acquaintance with circumstances, often as varying as places. They condemn the idea of conducting farming operations upon one invariable plan; and, while they welcome science as the best auxiliary of practice, they regard crude speculations as the most dangerous of delusions. But they also feel that in Agriculture, as in all other arts, there are general principles upon which successful farming must depend; that there are practical errors which no local circumstances can justify. In short, that there is room for improvement even in those branches which are best understood. No one man can be competent to deal with the multifarious questions affecting husbandry, and the duty of the Editor of such a Paper as THE AGRICULTURAL GAZETTE is to make known the knowledge of all. It is to practical Farmers that the Proprietors trust for the means of carrying out their views, and not to the talents of any individual. While, therefore, they state that the Editor of THE AGRICULTURAL GAZETTE will be a gentleman well acquainted with the best kind of Farming, in which he is actively engaged, they feel it to be of far more importance to announce the promise of assistance received from the landed and farming interest generally, especially of those whose names they are permitted to mention:—

The Right Hon. the Earl Spencer, President of the Royal Agricultural Society of England.

The Right Hon. the Earl of Ducie, Vice-President of the Royal Agricultural Society of England

Mr. John Morton, Agent to the Earl of Ducie
Mr. Shoosmith, Folkington, Sussex
&c. &c. &c.

The Practice of Agriculture—its Science—Animal and Vegetable Physiology—Improvements in Implements—better modes of Husbandry—results of well-conducted experimental Farming—Growth and Rotation of Crops—Stock—Drainage—Irrigation—Foresting—Road-making—Farm-Buildings—Labourers—in short, whatever affects the beneficial employment of capital in land—will form topics of consideration. Reports will be given of the English, Scotch, and Irish Agricultural Societies—London Market Prices of Corn, Hay, and Cattle, and the Weekly Averages. Replies to questions connected with the object of the Paper will also be furnished weekly.

Considering the union which exists between Horticulture and Agriculture, it has been thought advisable to make THE AGRICULTURAL GAZETTE an addition to the GARDENERS' CHRONICLE, edited by DR. LINDLEY, and so extensively known: but that there may be ample room for discussion, that Paper *will be increased one-half in size without additional charge*—thus Twenty-four Columns will be occupied, as at present, by Horticulture, and Twenty-four by the General News of the Week, whilst

Twenty-four Columns will be devoted to Agriculture:

This day, therefore, January 6th, is published, price SIXPENCE, stamped to go free by post, the First Number of

THE GARDENERS' CHRONICLE AND AGRICULTURAL GAZETTE:

A Weekly Record of Rural Economy and General News.

THE HORTICULTURAL PART EDITED BY PROFESSOR LINDLEY,

THE principle on which the Gardening part of this Paper has been conducted has been to make it a weekly record of everything that bears upon Horticulture, Floriculture, Arboriculture, Garden Botany, and such Natural History as has a relation to Gardening, with Notices and Criticisms of all works on such subjects. Connected with thispart are WEEKLY CALENDARS OF GARDENING OPERATIONS, given in detail, and adapted to the objects of persons in every station of life: so that the Cottager with a few rods of ground before his door, the Amateur who has only a greenhouse, and the Manager of extensive gardens, are alike informed of the routine of operations which the varying seasons render necessary. It moreover contains reports of Horticultural Exhibitions and Proceedings—Notices of Novelties and Improvements—in short, everything that can tend to advance the profession, benefit the condition of the workman, or conduce to the pleasure of his employer; accompanied with Woodcuts, whenever the matter treated of requires that mode of illustration.

To this Farming, as explained above, will now be added.

Lastly, that description of domestic and political News is introduced which is usually found in a Weekly Newspaper. It is unnecessary to dwell on this head further than to say, that the Proprietors do not range themselves under the banners of any party; their earnest endeavours have been to make THE GARDENERS' CHRONICLE a full and comprehensive *Record of Facts* only—a Newspaper in the true sense of the word—leaving the reader to form his own opinions; their object being elucidation of the laws of Nature, not of man. The reader is thus furnished, IN ADDITION TO THE PECULIAR FEATURES OF THE JOURNAL, with such information concerning the events of the day as supersedes the necessity of his providing himself with any other Weekly Paper.

The Proprietors are happy to announce that the following distinguished Botanists, Florists, and Practical Gardeners have already enriched the GARDENERS' CHRONICLE by their communications:—

The Hon. and Very Rev. W. Herbert, Dean of Manchester
The Hon. and Rev. Charles Bathurst
Hon. W. Fox Strangways
Sir Oswald Mosley, Bart.
Sir W. J. Hooker, Royal Gardens, Kew
Dr. Horner, Hull
Dr. Lancaster, F.L.S.
Rev. J. M. Berkeley
J. Bateman, Esq., Knypersley
Mr. W. Billington, Oswestry
Mr. Ingram, Gardener to Her Majesty
Mr. Paxton, Gardener to the Duke of Devonshire
Mr. Alexander, Gardener to the Duke of Leinster
Mr. Ferguson, Gardener to the Duke of Buckingham
Mr. Spenser, Gardener to the Marquis of Lansdowne
Mr. Elliott, Gardener to the Earl of Tyrconnell

The Hon. and Rev. L. Vernon Harcourt
Hon. Algernon Herbert
Sir George Mackenzie, Bart.
Sir Charles Wolsey, Bart.
Dr. Bevan, Llanterry
Dr. Gregory, Aberdeen
Dr. Ingram, President of Trinity College, Oxford
Rev. J. B. Reade
Mr. Henderson, Gardener to the Earl Fitzwilliam
Mr. Frost, Gardener to Lady Grenville
Mr. Haythorn, Gardener to Lord Middleton
Mr. Hallidry, late Gardener to Lord Sondes
Mr. Brown, Gardener to Lord Southampton
Mr. Errington, Gardener to Sir P. Egerton, Bart
Mr. Fortune, Hothouse, Dept., Hort. Gardens, Chiswick
Mr. Thompson, Fruit Dept., Hort. Gardens, Chiswick

G. Bentham, Esq., late Secretary of the Horticultural Society
L. W. Dillwyn, Esq., Sketty Hall
J. D. Llewelyn, Esq., Penllrgare
Mr. Bailey, Gardener to the Archbishop of York
Mr. Mackintosh, Gardener to the Duke of Buccleuch
Mr. Moffat, Gardener to the Duke of Newcastle
Mr. Tillery, Gardener to the Duke of Portland
Mr. Cooper, Gardener to the Earl Fitzwilliam
Mr. Bowers, Gardener to the Earl of Lucan

STREET, General Newspaper and Advertising Agent, begs to inform the public that he supplies the *Agricultural Gazette* and all the other London Newspapers to all parts of the Kingdom and Her Majesty's Colonies free of postage, by the Morning Mails, to those places for which the Post-office makes up bags, at the marked price of each Paper. Advertisements received for all the London and Country Journals.

BETTS'S PATENT BRANDY.—DISTILLERY, No. 7, SMITHFIELD BARS.—Notwithstanding the publicity for many years past given to the superiority of BETTS'S PATENT FRENCH DISTILLED BRANDY over every other Spirit, British or Foreign, it is yet but partially known: J. T. BETTS and Co. therefore feel it a duty they owe to the Public and themselves, to invite a comparison between the Patent and the French Brandy, until every Family in the kingdom, in which Brandy is consumed, have made trial of their Patent Brandy,—and, consequently, discontinued the use of the Foreign article. Their respective merits are fairly developed in the following Testimonials, to which they again beg to refer:—

EXTRACTS FROM TESTIMONIALS.

"I do not hesitate to express my conviction that your Patent Brandy is fully as free from everything injurious to health, and contains as pure a spirit as the best varieties of Foreign Brandy. EDWARD TURNER, Professor of Chemistry in the University of London. "John T. Betts, Esq."

"I am bound to say, and do assert it with confidence, that, for purity of spirit, this cannot be surpassed; and that your Patent Brandy is also quite free from those acids which, though minute in quantity, always contaminate the Foreign Spirit. JOSEPH HUME, Chemist to His Majesty. "J. T. Betts, Esq."

"Your Brandy is free from uncombined acid and astringent matter, which exists, more or less, in most of the Brandies imported from France. JOHN THOMAS COOPER, Lecturer on Chemistry. "To Mr. Betts."

It is this perfect freedom from the above objectionable qualities, and its agreeable similarity in flavour to the finest samples of Cognac Brandy, that constitute the peculiar value of the PATENT BRANDY.

J. T. BETTS and Co. are, at length, enabled to give a distinct assurance that arrangements will be completed in the course of the present month, which will afford an unfailing protection to purchasers against the continuance of those frauds, from which they have hitherto so extensively suffered; as each bottle will be secured by a PATENT METALLIC CAPSULE, or covering for the cork, of solid metal, with their name, address, and the words "BETTS'S PATENT BRANDY" embossed upon it; the forgery of which subjects the guilty party to a Penalty of Fifty Pounds for every offence.

This valuable Spirit is manufactured only at the Distillery, No. 7, Smithfield Bars, leading to St. John-street; where it may be obtained, either pale or coloured, in quantities not less than Two Gallons, at 18s. per Gallon, for Cash, on delivery.

MECHI'S ELEGANCIES FOR PRESENTS, manufactured on the premises, 4, Leadenhall-street, near the India House, London, wholesale, retail, and for export.—Ladies' and gentlemen's dressing-cases in leather, wood, and papier maché, from 100 guineas each down to 25s.; writing-desks, 25 guineas down to 12s.; work-boxes, 20 guineas to 10s.; ladies' cabinet and jewel-cases (assorted), tea-caddies, the most elegant in the world, 12l. to 6l. each, down to 7s. 6d.; ladies' papier maché work-boxes, 10l. each, down to 3l.; netting-boxes, 30s. to 23s.; card-boxes, 5l. 5s. to 11s.; set of tea-trays, 20 guineas to 5l.; bottle-cases, 30s. each; companions, 2l. 10s. to 10s. 6d. each; pole-screens, 9l. the pair; hand-screens, 50s. to 20s. the pair; card-racks, 40s. to 25s. per pair; note and cake-baskets, 50s. to 20s. each; bagatelle-tables, 10l. 10s. to 3l. 10s. each; leather writing-cases, containing a complete dressing apparatus, 15l. 10s. to 5l. 10s.; pearl and fancy card-cases, 3l. 10s. to 10s. each; ivory hair-brushes, 4l. to 2l. 10s. per pair; splendid cases of seven-day razors, 10l. to 2l. 10s. the set; ivory-handle and other highly-finished strops, from 25s. to 3s. each; Wharncliffe penknives, sporting knives, and fancy scissors, 3l. to 5s. each; splendid case of agate, pearl, and ivory dessert-knives and table-knives, from 42l. to 4l. 4s. the case; a rich variety of plate, bronze, gilt, and papier maché and table inkstands, from 6l. to 7s. 6d. each. The quality generally of Mechi's manufactures, the elegance of their display, and the rare combination of excellence and economy, with a very extensive choice of stock, will amply repay the trouble of visiting his depot, 4, Leadenhall-street.

CHRISTMAS FESTIVITIES.—The gaiety that reigns supreme at this festive season, when friends and lovers assemble at the social board, or whirl in the giddy mazes of the dance, induces both sexes to be more than usually desirous of shining in personal attraction, and to devote a greater share of attention to the toilet. It is at this particular season that the virtues and singularly happy properties of those auxiliaries of personal beauty, ROWLAND'S KALYDOR, ROWLAND'S MACASSAR OIL, & ROWLAND'S ODONTO, shine pre-eminent in their power; while the white and swan-like neck, the rich luxuriant tress, and the Pearly set of Teeth form admirable trophies of their inestimable qualities! The August Patronage conceded by our Gracious Queen, and the several Sovereigns of Europe, together with the Beauties which adorn the circles of Princely and Regal Magnificence; and the confirmation by experience of the infallible efficacy of these creative renovating Specifics, have characterized them with perfection, and given them a celebrity unparalleled.

*** Ask for "ROWLAND'S" Articles.

All others are SPURIOUS IMITATIONS!!!

PIANO FORTES. LUFF AND Co's Boudoir or Piccolo Piano Forte, 25l.; Cottage, 27l., Package and use of Case included. For tone, touch, durability and cheapness, these Piano Fortes are unequalled. Warranted to keep well in tune, and prepared for extreme climates. L. and Co's Patent Piano-Fortes equally cheap. Two new Patent Semi-Grand's just returned from Hire, very cheap.—LUFF AND CO., 103, Great Russell Street, Bloomsbury.

DRAINING.—JOHN DAVIS, Mathematical Instrument Maker, Derby, begs to direct the attention of Agriculturists to a very efficient and simple Level he has just constructed, adapted especially for Draining. The private Farmer or the professional Drainer will alike find in it all that is desired. The Instrument is fitted in a case, and sent to any part of the country—the price, 3l. 5s.

News of the Week.

By the arrival of the regular Overland Mail we have advices from Bombay to the 1st December, and from China to the beginning of October. Sickness continues to decimate the army of Sir Charles Napier in Scinde, and the Indian papers declare that the malaria of the banks of the Indus has proved much more formidable to our troops than the snows of Cabul. Of an army of 13,000 men about one-third are in hospital, and of 8504 men composing the garrisons of Hyderabad and Kurrachee, no less than 3656 are on the sick-list. The affairs of the Punjaub still occupy the attention of the Indian Government, and a crisis is expected as soon as the Governor-General has reached the Sutlej, where a powerful force is concentrating under the command of Gen. Hunter. Heera Singh, the son of the late Minister of Runjeet, still retains his power, and has the child king Dhuleep in his custody. He has also obtained the support of his uncle, a leading hill-chief, who has entered Lahore with an army of 20,000 men. In Gwalior civil war still prevails, and the Military preparations on the frontier have been accelerated in anticipation of further disturbances calling for British intervention. In Affghanistan, although the rumoured murder of Dost Mahommed proves to be a fabrication, the position of that chief is daily becoming more precarious. He is threatened with invasion from Bokhara, and his son, Akhbar Khan, who has been made governor of Jellalabad, is expected to seize upon Peshawur, which is now left undefended and open to attack from all the plunderers of the Khyber Pass.—In China, the sickness in our new colony at Hong Kong excites general alarm, and it is even rumoured that the British authorities contemplate the abandonment of the island. The settlement of the supplementary treaty, by which the Chinese guarantee to all foreign nations the same privileges of trade as those enjoyed by the British themselves had given great satisfaction. The accomplishment of this object was regarded at Canton as a triumph of diplomacy on the part of Sir Henry Pottinger, as it renders useless all the attempts of the French and American missions recently sent to China.

From France we learn that the elections of the President and Vice-Presidents of the Chamber of Deputies, and of the Commissioners on the Address in both Chambers have terminated in favour of the Cabinet. In the House of Peers the commission has been instructed by all the bureaux to insert in the Address a paragraph against the Royalists who visited the Duc de Bordeaux in London; but Ministers, it is said, do not intend to suggest such a measure in the Chamber of Deputies. The proceedings of the Royalist party are the subject of unceasing vigilance; five Legitimist journals have been seized within three days, and two more Mayors of provincial towns have been dismissed for the part they took in the late demonstrations of Belgrave Square.—From Spain we have the important announcement of the dissolution of the Cortes—a measure which is regarded as another step towards the absolute power of the military Cabinet. Great anxiety is felt at Madrid for the result of this policy, and while one party is demanding the immediate return of Queen Christina, others have merged their political differences and united for the recall of Espartero, whom they describe as the only man capable of saving Spain at the present crisis. Señor Olozaga has taken refuge in Portugal, to escape a plan of assassination which had been revealed to him, and is now in Lisbon.—From Canada we have some further details of the recent differences between the Governor General and the Executive Council. The Legislative Assembly have passed a resolution disapproving of the Governor's proceedings, and have followed it up by an address of remonstrance. The Governor General in reply concurs in the principle of a consulting Council, but refuses to surrender the prerogative of the Crown by submitting all appointments to the sanction of a Council, which may convert them into party questions, or use them for party purposes.

Home News.

COURT.—The Queen and Prince Albert arrived in town from Windsor on Friday. Her Majesty and the Prince attended by Mr. Blore inspected the new Chapel Royal in the Palace, and viewed the new Summer Temple in the Royal Gardens, after which they took their departure by the Great-Western railway on their return to Windsor. On Saturday morning her Majesty and his Royal Highness took their usual walking exercise after which the Prince went out shooting in the Royal preserves. On Sunday the Queen and Prince attended divine service in

the private Chapel of the Castle. On Monday morning the Queen and Prince attended by part of the Royal suite went to the riding-house to see the poor receive her Majesty's bounty, consisting of 199 pairs of blankets weighing upwards of 1500 lbs., 772 lbs. of plum-pudding, 1800 lbs. of beef, 1000 lbs. of bread, 186 cwt. of coals, 172 pecks of potatoes, and 672 pints of the best ale. 180 families received each a pair of blankets, and the provisions were distributed amongst 196 families, including 391 children. In the afternoon the Royal party left the Castle for an airing, her Majesty and Prince Albert in a pony phaeton, his Royal Highness driving. On Tuesday Prince Albert, accompanied by Prince Ernest of Saxe Weimar, went out rabbit shooting in the Royal Preserves. In the afternoon her Majesty and the Prince walked within the precincts of the Castle. On Wednesday her Majesty and the Prince also enjoyed their customary walk; and on Thursday took a drive in a pony phaeton. The visit of the Court to Claremont is said to be postponed in consequence of the prevalence of scarlet fever among the domestics of that establishment. Col. Arbuthnot has succeeded Maj.-Gen. Wemyss as Equery in Waiting, and Captain Dundas has succeeded the Hon. Nelson Hood as Groom in Waiting on her Majesty; and Sir E. Bowater has succeeded Col. Bouverie as Equery in Waiting on Prince Albert. The Court went out of mourning on Thursday for the ex King of Holland.

The Duc de Bordeaux.—His Royal Highness left Clifton on Friday for Ugbrook, the seat of Lord Clifford, and on Saturday paid a visit to Plymouth, for the purpose of inspecting the Arsenal and other public establishments in that port. On Sunday after church his Royal Highness went out to the Sound in the Port-Admiral's yacht, but the surf did not allow him to land on the breakwater. He then returned and visited H.M.S. Vernon, 90 guns. The men-of-war lying in the Sound received his Royal Highness with yards manned and all the honours due to his rank. The Prince afterwards made calls at the official residences of the Port-Admiral and the Commander-in-Chief of the troops in the district. On Monday morning the Prince visited the dockyard and made a general survey of the establishment, all the officers being in attendance at their respective departments to give every information. The Prince visited Mount Edgecumbe in the afternoon and afterwards dined with the Port Admiral, Sir David Milne. His Royal Highness returned to Ugbrook on Tuesday and proceeded to Powderham Castle on a visit to Lord Courtenay. It is said that the Prince will leave England for the Hague about the 12th inst. on a visit to the King of Holland, and that the Emperor of Russia and the Kings of Hanover and Sardinia have invited him to their Courts.

Earl Grey.—The accounts which have arrived in town this week relative to the health of Earl Grey are more satisfactory than any which have been previously received. It is expected that the noble Earl will be able to leave his room in a few days.

Law Changes.—There is a rumour current in Westminster Hall that the Government wish to make an additional common-law court, and to constitute a court of appeal in criminal cases.—It is said that the Chief Justiceship of Hong Kong has been offered to no less than seven members of the English bar and been declined by them all, although the salary attached to the office is to be 3000*l.* a year.

National Education.—The Rev. H. Moseley, Professor of Natural Philosophy at King's College, has, it is said, received the appointment of Inspector of Normal Schools from the Committee of Privy Council for Education.

The Navy.—It is understood that the command at the Nore will be conferred either on Sir Jahleel Brenton or on Sir W. H. Gage, now one of the Lords of the Admiralty, whose present appointment would in that case be bestowed either upon Rear-Admiral Bowles or Rear-Admiral Ross.

The Revenue.—The Revenue for the Quarter and Financial year ending yesterday the 5th inst., was made up last evening, and the *Standard* Ministerial paper states that from the accounts already received, it is likely to show an increase on the quarter, as compared with the corresponding quarter of last year, and on the year a considerable increase. It is satisfactory in the important item of Excise on the year there is an increase of about 400,000*l.* The Customs will exhibit an increase on the year of nearly half a million. In the Stamps there is a small decrease on the quarter. The property and income-tax remains much the same, averaging something more than 1,260,000*l.* the quarter. In the assessed taxes a slight decrease is anticipated. The Post-office returns, it is expected, will not materially differ from former quarters, and the returns from the other branches of the revenue are considered satisfactory. On the whole, the revenue for the last year shows a gradual increase in the trade and commerce of the country, and will, it is believed, exhibit a surplus. The revenue for the year will, it is confidently expected, exceed the expenditure of the country; but the exact amount is not yet known, as some of the returns from the public departments have not yet been completed.

The Light Gold Coinage.—On Monday the order in Council issued on the 2d October on the light gold currency came into operation, which commands "that light sovereigns of less weight than 5 pennyweights 2½ grains, and every gold half sovereign of less weight than 2 pennyweights 13 grains and one-eighth, shall not be allowed to be current, and shall be cut, broke, and defaced by all Government officers, receivers of the public revenue, so that they be no longer circulated." The Directors of the Bank of England have given notice that they will receive gold coin below the legal current weight in amounts of not less than 5*l.*, at the rate of 3*l.* 17*s.* 6½*d.* per ounce; and further that at the respective branch banks of the Bank of England it will be received in like amounts at the rate of 3*l.* 17*s.* 5*d.* per ounce, being, after deducting the charges of transmission to London, equal to the above price of 3*l.* 17*s.* 6½*d.* per ounce.

Foreign.

FRANCE.—The election of President of the Chamber of Deputies took place on Thursday, when M. Sauzet, who has filled that office in the four last sessions, was elected. In the first ballot M. Sauzet had 157 votes, which did not amount to the half of those then present, which were 326. M. Odillon Barrot had 91 votes, which marks the force of the liberal opposition, comprising the members who follow M. Thiers. M. Dupin had 65 votes. In the second ballot all the conservatives rallied to M. Sauzet, who, nevertheless, had only 16 votes above the bare majority. On Friday the Chamber proceeded to the election of the four Vice-Presidents. The same members were chosen who were Vice-Presidents during last session. They all belong to the conservative party, and their election is therefore considered by their organs a further triumph to the ministry.—A curious circumstance occurred in the Chamber on Saturday. M. Laffitte, the eminent banker, who, as the oldest member present, presided at all the preliminary sittings, yielded his place to M. Sauzet, the definitive President. It is the usual custom for the provisional President to address the house, on leaving the chair. M. Laffitte did so, and in the course of his remarks introduced some matters which were not altogether pleasing to the Ministerial members, and the consequence was that there were considerable murmurs in the house. M. Sauzet then took the chair, and as is also usual, he proposed a vote of thanks to the "*doyen d'age.*" There was a great opposition and it was for some days doubtful how the matter would terminate; but ultimately a vote of thanks to the "*Bureau Provisoire,*" was carried without naming M. Laffitte. This is the first time such marked disapprobation has been shown in a similar case. M. Laffitte's speech was violently against the Government, although he so powerfully co-operated with the late General Lafayette in placing the House of Orleans on the throne. He said that the peace which the country enjoyed was but apparent, and that at its root lurked confusion and anarchy, that the French people were really in a state of complete disorganisation, and that venality and corruption were the ruling principles of the Government. Under these circumstances he said it was requisite to act with caution. For fourteen years a struggle had been raging between the Central and Local Powers, or in other words between Monarchy and Democracy.—On Tuesday the Commission on the Address was appointed, when the Ministerial party were in a majority of 7 to 2. The selection of the commission was preceded by much discussion. In the first, third, and fourth committees, of which the Duc de Valmy and MM. Berryer and De Larcy form part, it was proposed to insert in the address a paragraph, censuring the Deputies who have paid their respects to the Duc de Bordeaux. Almost the whole Opposition abstained from noticing the proposal.—In Thursday's sitting of the Peers, the Prince de Joinville took his seat, as well as M. Passy and the late Minister of Public Works, M. Teste. In Friday's sitting, the commission on the address was selected, the Duc de Broglie being the reporter, and Count de Pontecoulant the president. It is said that all the bureaux of the Peers have instructed the commissioners to insert in the address a sentence against the Royalists who have visited the Duc de Bordeaux in London.—The *Moniteur* publishes a Royal ordinance, dismissing from the post of Mayor the Count de Montbreton and the Marquis Anjorrant, for having gone to London to pay their court to the Duc de Bordeaux. The Government, it was said, intended to bring to trial the officers who lately repaired to London with the same object, "for having violated an article of the laws of the army, which prohibits the military from quitting the kingdom, without special leave, under the penalty of forfeiting their commission." Five Royalist papers have been seized in three days, the *Gazette de France* being the fifth.—It is said that the Ministers have decided upon not presenting the law of dotation to the Duc de Nemours, in consequence of the feeling of the Chambers against it.—On New Year's day, both the Chambers, the great functionaries of State, the ambassadors, judges, &c., attended at the Tuileries to pay their respects to his Majesty.—The *Journal des Débats* in announcing the departure for Madrid of Messrs. Donoso Cortes, and Ros de Olano, the envoys who brought to the ex-Queen Regent the invitation of Queen Isabella to repair to the Spanish capital, asserts that her Majesty Queen Christina had altered her mind on the subject and would leave Paris for Madrid in the beginning of next month, in order to undertake the education and charge of her second daughter the Infanta Louisa.—The resignation of his commission in the army by the Prince de la Moskowa, son of Marshal Ney, has led to much comment and correspondence in Paris and in its journals. Marshal Soult had promised the Prince his promotion to the rank of Colonel to which he was entitled from service, and in fact he has actually and for a long time commanded the regiment. Marshal Soult having expressed his wish but his inability to keep his promise in this respect, because some powerful hand withheld him, the Prince de la Moskowa spoke on the subject to the Duc de Nemours who according to the *National* owned that an officer in so marked an opposition to the Government could not expect promotion. The Prince however denies that the Duc de Nemours made use of these words. The resignation however and the principal facts remain uncontradicted. —A letter from the island of Bourbon of the 1st September, published in the French papers, states that the English have taken possession of Diego Saurez, a magnificent port in the island of Madagascar.—The Royal Court of Paris decided on Wednesday that an East Indian slave as well as all other slaves recovered their liberty the moment they set their foot on the territory of France.—The message of the President of the United States has attracted great attention in Paris and is generally condemned.—The Marseilles papers state that several Englishmen have followed the example of Lord Brougham and purchased property in the neighbourhood of Cannes. Gen. Taylor and Mr. Leader the late member for Westminster are mentioned among the number, and it is added that the latter gentleman is about to build a villa near the estate of Lord Brougham.

SPAIN.—Accounts from Madrid of the 27th bring the long-expected announcement of the dissolution of the Cortes. This measure, which is regarded as another step towards absolute government on the part of the Cabinet, is said to have been adopted on the 26th, and kept a profound secret until its communication to the Chambers. The Government it appears was determined—1st, to levy without the legislative sanction the supplies necessary for the wants of the Government; 2dly, to publish a decree on the Ayuntamientos and the Provincial Deputations, and another on the organisation of the National Guards; and 3dly, having accomplished those objects, to convoke again the Cortes and demand from them a bill of indemnity, and an approbation of measures which they had considered it a duty to adopt for the welfare of the country. Should the Cortes refuse to sanction them they are again to be immediately dissolved. Great anxiety was felt as to the effect the suspension of the sittings of the Cortes would produce, the influence it would exercise over the provinces being the principal object of solicitude. In Madrid some were demanding the immediate return of Queen Christina, while in the meantime the old Liberal party had re-united in opposition to Gen. Narvaez and his ministerial agent M. Gonzales Bravo. The leading Esparterists and the anti-Esparterist Liberals met on the 27th, and both MM. Cantero and Caballero candidly avowed the fault they had committed in overthrowing Espartero, whom they described as the only man capable of saving Spain at the present crisis. Señor Olozaga has taken refuge in Portugal, having entered Castello Branco on the 19th inst. The authorities immediately communicated with the Lisbon Government, who despatched orders for his reception with the attention due to his rank.—A violent attack had been made on the office of a newspaper, the *Eco del Comercio*, which had given offence to the partisans of Queen Christina. The assailants were military officers, who destroyed the office and the type. The outrage continued to attract universal attention at Madrid on the 23d ult. In the Chamber of Deputies on that day, M. Diaz de las Navas and several other members questioned Ministers as to the steps the Government had taken to discover and chastise those who had been guilty of the devastation; much confusion ensued, and a more stormy scene would probably have taken place had not the Minister for Foreign Affairs firmly refused to communicate for the present the results of the investigation, which was actively proceeding.—By the Barcelona journals of the 26th we learn that Prim's troops opened their fire on the 20th against Ametler's works, and kept it up on the 21st, when the besieged cannonaded the town. On the 22d a suspension of hostilities took place, and a commission of inhabitants of Reus ascended to the fort in order it was said to negotiate a capitulation. Baron de Meer arrived on the morning of the 23d, on which day the attempt made to induce Ametler to surrender failed, Ametler having refused the terms of capitulation offered. Further reinforcements had arrived, and on the morning of the 24th the firing from the fort recommenced. It would appear to be the intention of the Baron de Meer to prosecute the siege with vigour.

PORTUGAL.—From Lisbon we have the official announcement that S. Olozaga has taken refuge in Portugal, and that the Chambers have again been summarily closed, although nothing effective has been done. The excitement still continues throughout the wine districts, and the farmers are uprooting their vines in various directions. Tranquillity generally prevails, although memorials to the Queen to dismiss her Ministers have been forwarded from both Oporto and Coimbra.

GERMANY.—The King of Bavaria has commissioned Dr. Pauli to proceed to England and Ireland for the purpose of personally inspecting the atmospheric railroad, and report his observations to the Bavarian Government. —The state of Hungary does not appear to be very settled. A meeting of 700 or 800 electors took place lately at Agram, which was dispersed by the Government, and the consequence was a collision between the Illyrians and the Magyars, in which some lives were lost. The Jews of Presburgh recently announced their intention of giving a public ball to celebrate the declaration of their municipal rights. The authorities however interfered, and intimated to the Israelites that for the sake of their own safety they had better desist from obtruding themselves before the public, who might perhaps on provocation take the law into their own hands.

ITALY.—Letters from Rome to the 26th ult. announce the death of Cardinal Spada in his 56th year, and state that the condition of the Pope's finances is very bad, and the country in a wretched state; but that notwithstanding he is obliged to levy further imposts upon the people for the purpose of increasing the army. The direct taxes have been doubled throughout the states, and the cus-

e me duties have been greatly increased. Cardinal Massa, the new cardinal legate at Ravenna in place of Cardinal Amat, had arrived in that city and assumed the government. The probability of dispensing with the Swiss Guards and replacing them by corps of peasants under the name of Pontifical Volunteers was still spoken of. It was thought that this plan, if put in execution, would create disorders in the States. It was at one time proposed to re-establish the National Guard, but the Papal government is afraid that it would be made the means of disseminating liberal opinions. The court of Rome is greatly embarrassed, not only in its internal policy but in its diplomatic relations.—From Naples we learn that the railroad from Naples to Caserta was inaugurated last month by the King in person, and that it will be opened to the public in a few weeks. It is intended when entirely completed, to reach as far as Capua.

GREECE.—Accounts from Malta state that the Geyser arrived on Christmas-day from Athens bringing reports of a fearful disturbance in Athens, the feeling against Russia being very great; the Ambassador's house, &c. burnt down. Advices, however, had been received from Corfu of the 22d (the day the Geyser left), but no mention is made of the report, which rests on the authority of a private letter.—The following is from the *Greek Observer* of the 19th December:—"The National Assembly has held few sittings for the last ten days. The labours of the committee on the address and the charter having just commenced at the departure of the last courier. On Friday the project of the address was read and distributed to the assembly. The discussion upon it was postponed till Monday, in order that the plenipotentiaries might have time to mature their opinions, which appeared the more necessary because the project of the commission had encountered serious opposition. It has been even reproached to it that it does not indicate the unhappy causes which produced the reforms of the 3d (16th) of September, and, in general, of not having been sufficiently Hellenic. This omission having been considered by a great number as a mark of indifference for the events of that great day, the Ministry, to do away with all uneasiness regarding the future on the part of the officers who supported the demand for constitutional reform, proposed yesterday in the National Assembly to ensure the active service in their several grades during their lifetime. This proposition was adopted by acclamation. To-day the general discussion on the address was closed. Amendments will be proposed on the several paragraphs. Among the most prominent of the speakers who supported the address were MM. Mavrocordato and Tricoupi, and on the other side MM. Petsalis, Costakis, and Axelos."

RUSSIA.—The following notice has been issued by the Finance Department:—"Conformably to the first article of the treaty concluded and signed at London on the 8th (20th) of December 1841 between Russia, Great Britain, Austria, and Prussia, for the total suppression of the slave trade, the Russian Government has delivered the first license to English cruisers by which those cruisers are authorised, in the seas where the reciprocal right of search may be exercised, to search and detain according to the said treaty merchantmen sailing under Russian colours which are suspected of being concerned in that trade, or of being fitted out for that purpose, or of having carried on that trade during the voyage on which they were stopped by the English cruisers. These licenses signed and sealed by the Russian Board of Admiralty are drawn up in the Russian, English, German, and Swedish languages. The cruisers authorised to exercise the right of search are to use a particular signal which has been agreed upon by the contracting parties who signed the treaty of December."—A letter dated Dec. 16 says:—"The ukase ordering the removal of the Jews from the frontier districts into the interior is at this moment being carried into effect. Nearly 100,000 persons are affected by this measure. They receive passports which indicate their place of residence, and they are expected to have all their property sold off within a few days after."—The monument which the Emperor has caused to be erected at Kowno in commemoration of the events of 1812 was inaugurated on the 10th Nov. The construction is of huge size, and on the front are these words taken from the Emperor Alexander's first manifesto on the opening of the Russian campaign:—"God is against the aggressor;" and on the opposite side—"In the year 1812, not less than 700,000 hostile troops perished in Russia, and only 70,000 were able to escape!"

TURKEY.—Letters from Constantinople of the 18th ult. state that a Greek was decapitated about a fortnight since for abjuring Islamism, to which he had been recently converted, at Bilejeh, a town in the neighbourhood of Broussa. The reasons for which he has suffered are said to be purely religious. The British Consul at Broussa, Mr. Sandison, has been instructed to investigate the matter and report thereon. If the execution was authorised by the Government, which is rendered probable by the circumstance that the executioner was sent from Constantinople, the affair will necessarily assume a character of the gravest aspect. The recent execution at Constantinople drew from the Great Powers strong remonstrances, which judging from the immediate disgrace of the President of the Council and the verbal assurances given by the Porte that it should not be repeated, seem to have produced a salutary effect, but the present proceeding is much aggravated by the deliberate insult implied by it to the Christian Powers.—An extraordinary affair has lately taken place in Lemnos in the Archipelago. The Turkish Caimacam of that place having illegally exacted tribute from British residents, Sir S. Canning obtained from the Porte a vizerial letter, commanding that functionary to restore the money to the people he had plundered. The letter was presented by Mr. Calvert the Vice-Consul, accompanied by Captain Robinson of H.M.S. Orestes. After some demur the Caimacam consented to reimburse the British residents; but afterwards, on the departure of Captain Robinson in the Orestes, broke his word, and on being remonstrated with, by Mr. Calvert, answered in the most abusive language, employing very offensive expressions with respect to her Majesty. The Vice-Consul knowing that the Orestes, which the Caimacam thought to have left the station, was cruising in the neighbourhood, despatched a messenger with an account of what had taken place to Capt. Robinson. The latter having forthwith returned to Lemnos, landed his marines and the greater part of his crew, and marched with colours flying to the residence of the Caimacam. Being admitted to an interview, he demanded an instant and ample apology for the insult offered to her Majesty, stating that if it were delayed for a moment, he would set sail to Constantinople to lay the affair before the Sultan; and adding that, though with the force he had brought he could immediately compel the Caimacam to give satisfaction, he would not do so till he had been authorised by his Government. The Caimacam, dismayed by this conduct, acceded to all the demands, and made an apology for what he had said in presence of all the local authorities.—Letters from the Danube state that a plot for the overthrow of the present order of things in the districts of the Danube and Bosnia has just been discovered and numerous arrests have taken place. This plot appears to have had the same purpose and object as the recent conspiracy of Braila, and the traces of a scheme of the Polish Propaganda directed on the Sclavonic populations of the Danube are perceptible. The leaders have fled. Throughout all Bulgaria ukases, insinuated into the Greek Christian Churches, are read by the Popes. In those documents all the believers in the Greek Church not yet formally united are desired to be firmly bound to each other, and assured that in case of need they may be certain of high protection.

INDIA AND CHINA.—The Indian Mail has arrived, with letters and papers from Bombay to Dec. 1. The principal items relate to the prevalence of sickness in the newly-acquired possessions of Scinde, and Hong Kong. The accounts from Scinde state that of an army of 13,000 men about one-third was in the hospital. The cause of the sickness is said to be the unhealthiness of the climate after the subsiding of the Indus, when the exhalations produced by a glowing sun over an extensive muddy surface are exceedingly dangerous. Fortunately, the mortality was comparatively little, as most of them easily recover, although much debilitated from the fever and boils. There appears to be but little danger apprehended from any of the neighbouring tribes. Sir C. Napier was at Kurrachee, where his wife had joined him. He purposed to go to Hyderabad in the beginning of December, and, with a considerable body of troops, to proceed to look out for healthy situations, at which the troops are to be stationed in future. At Lahore, Heera Singh, the young Minister, the son of Dhyan, who was the all-powerful Minister of Runjeet and of his successors until his death in September last, appears to retain power. He has the child, King Dhuleep, in his custody, and is now said to have obtained the aid of Goolab Singh, his father's eldest brother, and a leading Hill chief, who at the head of 22,000 men came in the beginning of November to the capital. Goolab Singh is looked upon as hostile to the British, and will it is thought bring about a decided conflict, by influencing his nephew and the Court not to assent to any proposals coming from the Government of India. A crisis however was expected when the Governor-General shall have reached the banks of the Sutledge. Several corps of the British troops were in movement in that direction. The number of troops at Ferozepore, Losiana, and Umballa, was estimated at 14,000 men. Major-Gen. Hunter commanded at the two former places, while Major-Gen. Sir R. Dick had the command of the Sirhind and Meerut divisions. Lord Ellenborough was to start about the 26th of Nov. for the north-western provinces, invested with every power to make peace or war by a special act of the Legislative Council. The report from Cabul that Dost Mahommed had been murdered has turned out to be a fabrication. His position, however, is far from an enviable one. He has named his son, the notorious Akhbar, to be Governor of the Hill country near Jellalabad, whence it is thought that he will attempt ere long the invasion of Peshawur. Peshawur is described as in a dangerous position, for there is no longer an European General to defend it, and all the plunderers around the Khyber Pass are anxious for an opportunity to sack it. In central India the affairs of Gwalior are at present most interesting; the Army of Exercise is assembling at Agra. On the 19th November a dispute took place between some of the troops at Gwalior, which ended in their fighting with each other, when 400 were slain on both sides. Khasgeewalla, the usurper, who some months ago had endeavoured to oppose the influence of the British, had been taken prisoner and nearly sacrificed by the insubordinate and enraged soldiers. He was saved with difficulty, and the insurgents appeased merely by the promise that he should be given up to the Company. —The news from China extends to the beginning of October. The most important intelligence was the arrangement of a supplementary treaty between the Chinese and British Governments; one clause of which is for the purpose of guaranteeing to all foreign nations the same privileges of trade as to the British themselves. This will have the effect of rendering unnecessary all negotiations between the Emperor and the other Powers. The Chinese Government is said to be sincere now in its determination to abide by the regulations of the treaty, which will prevent all discussions with other foreigners. The treaty is looked upon in the East as the most signal triumph of the British Plenipotentiary, for it renders nugatory all the attempts of the French and American diplomatic missions lately sent with such pomp to the Chinese coast. Sir H. Pottinger who had gone to Macao to attend the funeral of Mr. Morrison, is stated to have regarded the supplementary treaty of such importance as to have sent a steamer specially with it to Suez. The state of trade at Canton was not satisfactory, owing to the tricks of the old Hong merchants and their adherents the linguists. The state of trade along the coast however is said to be satisfactory. Howqua, the celebrated Hong merchant, had died at the age of 75, leaving 15,000,000 dollars' worth of property. The celebrated Commissioner Lin has also paid the debt of nature. The Rev. Mr. Gutzlaff has been appointed Chinese Secretary in the room of Mr. Morrison. Amongst the deaths in China are mentioned F. R. Foote, Deputy Commissary-General, and Capt. Haviland, of her Majesty's 55th Foot. In Hong Kong the sickness has arisen, according to the Chinese, from the nature of the waters of the islands, which they pretend cannot be used for any time without the worst result. It was even asserted that the British authorities contemplated the abandonment of that island since the death of Mr. Morrison.

UNITED STATES.—The mail-steamer Acadia arrived at Liverpool on Saturday in a few hours less than eleven days from Halifax. She left that place on the 19th and Boston on the 16th of December with eighteen passengers. The news from the United States is without interest. Nothing worthy of note had occurred in Congress, where the business of the session had hardly commenced. The various committees had been formed, and the reports from the different executive branches of the Government had been delivered in. A rumour prevailed that Mr. Fox, our ambassador at Washington, was about returning home, and that his place would be supplied by Mr. Packenham, late British Minister at Mexico. It was rumoured that the Democratic party had given up its division, and that the friends of Mr. Calhoun had consented to their being absorbed by the partisans of Mr. Van Buren. It was stated that this is on the understanding that although Mr. Van Buren is to be the President of the ensuing election, Mr. Calhoun is to command the votes of the Democrats in 1848. The great booksellers and publishers of America are joining the authors in memorialising Congress for an international copyright.

CANADA.—The news from Canada is more important than that from the United States. The remnant of his ministry upon which Sir Charles Metcalfe relied had not been able to command a majority. The attacks of Messrs. Baldwin and Lafontaine, declaring that the Governor-General wished to keep all nominations in his hands, were answered by Mr. Daly the only member of the late cabinet who remained in office, and Mr. Price who had given notice of a motion condemnatory of the Governor's proceedings felt obliged to amend it into a milder shape. Government pressed several amendments in vain, and Mr. Price's motion was carried by 45 votes to 24. The vote was followed up by an address of remonstrance, urging that according to the resolutions of the Legislative Assembly of the 3d Sept. 1841, the members of the Provincial Administration were entitled to be consulted on all Crown appointments to Office. Sir C. Metcalfe in reply declared that far from running counter to those resolutions, he considered them as constituting the necessary guide of every administration. It is stated that his Excellency notwithstanding the difficulties in which he is involved, continues firm in his determination not to recall any member of the late Government to his Council. The Mayor, Aldermen, and Common Councilmen of Kingston had presented an address, assuring him of their strong and unaltered confidence in his administration of the government of the province.

NEW ZEALAND.—Advices have been received from this colony to the 27th July. The *New Zealand Colonist* contains an address of Police Magistrate M'Donough, giving an account of the result of the recent contest at Wairau. After stating that Captain Wakefield and Mr. Thompson had fallen, Mr. M'Donough proceeds as follows:—"It is my conviction after obtaining evidence from all quarters that the affray was not the result of any premeditated design on the part of the natives, but that on the contrary they sought by every means to avert it, and did not fire a shot until five of their party had fallen, including the wife of Rangihaiata, who at the moment bore his own son in her arms. Upon receiving the disastrous intelligence, feeling it to be of the first importance to obtain authentic information of the intention of the natives, I immediately put myself in communication with those persons who were in a position to furnish accurate reports on the subject, and I have the satisfaction of informing you that the natives of Waikanae, at which place Rauparaha first landed, refused to allow him to remain among them, lest the friendly relations which had previously subsisted between them and the English settlers might be destroyed, and that I have every reason to believe these feelings to be shared by almost all the natives upon the coast. No apprehension therefore of any aggression on their part need to be entertained; but if from any circumstances a hostile purpose should be cherished by them, I have made arrangements which will immediately put me in possession of the fact, and enable me to make all necessary preparations to resist it."—A meeting of magistrates had been held, at which resolutions were passed requesting Mr. Spain to proceed in his

capacity of magistrate up the coast, to communicate to the natives the determination of the magistrates not to make nor sanction any attempts to take vengeance for the lives of the settlers killed at Wairau, but to leave it to Government who would act according to the law. Mr. Spain had accordingly proceeded to Otaki and had returned a few days previous to the date of the despatches. It was understood that on his arrival at Waikanae, he met with Rauparaha, who was endeavouring to persuade the natives of that place to make common cause with him against the settlers. The chief, however, continued firm to his first purpose, stating that he had always received from the settlers just treatment, and would not engage against them in a quarrel which noways concerned himself or his people. This friendly sentiment was confirmed by the statements of Mr. Spain, who took great pains to impress upon the whole body of natives that principle of English law which forbids that the innocent should be punished with or for the guilty. At Otaki, Mr. Spain met Watanui and the other chiefs of the Ngati Raukawa tribe, and received from them positive assurances that they would in no case be concerned in acts of oppression upon the settlers, but they unanimously stated their determination to protect Rauparaha at all hazards.—It was reported that this chief had died since the affair at Wairau. During the conflict in pressing up one of the lines cut by the surveyors the stump of a manuka-bush pierced through his right foot. From the accounts of the natives, which may however be exaggerated, it would seem that mortification commenced and that death speedily ensued. Meanwhile the inhabitants of Wellington petition Parliament for the establishment of a military force in Cook's Straits, to protect them from the repeated aggressions of the aborigines, who they say have the power at any time to massacre the whole British population—a consummation often threatened by Rauparaha, the chief engaged in the late calamitous affray.

CITY.

Money Market, Friday.—Consols for the opening closed at 97⅛; Three per Cents. Red., 97⅛ to ⅜; Three-and-Half per Cents., Red., 102⅜ to ½; Bank Stock, 186½ to 5½; Exchequer Bills, 67-69 pm.

Metropolis and its Vicinity.

The Weather.—During a great part of Sunday the weather was as mild as that of a May-day, and the sun shone out with great brilliancy; but towards evening a gale sprung up which during the night increased almost to a hurricane, followed by a great deal of rain, and between eight and nine a heavy fall of snow took place. At one o'clock on Monday afternoon the atmosphere again cleared up, and the sun shone out with genial warmth. At midnight on Tuesday the mercury having descended to 28° and the wind bearing northerly, the frost was very severe, and increased in intensity towards morning, at six o'clock the thermometer indicating only 20° Fahr. A more severe night has seldom been felt, and its severity may be judged from the fact that most of the ponds and still waters in the neighbourhood of the metropolis were covered with ice upwards of half an inch in thickness. The ornamental waters in the parks and Kensington-gardens were covered with a coating of ice; that in St. James's-park, near the Ornithological Society's, measured more than three-eighths of an inch in thickness. At the Humane Society's Receiving-house in Hyde Park active preparations were made for their winter campaign, while at many cutlers' shops the stock of skaits were furbished up and displayed for sale. But in a brief space of time the whole scene changed; the mercury rapidly rose, and at noon stood at 36°; the wind veered to the south-west, and the frost gave way. Before two o'clock it thawed rapidly, and the streets became slippery again, producing a marked contrast within 2 hours. The thermometer has since continued high, with a S.W. wind.

Fires in the Metropolis.—Mr. Braidwood, superintendent of the fire brigade, last week made his annual report to the directors of the principal insurance companies. It states that the fires in 1843 as compared with the previous year have decreased by 20; the average however for the last 10 years shows an increase of 62. The number of fires and alarms from January 1 to December 31, 1843, at which the engines of the establishment have been called into operation, amounts to 901. The fires by which premises were totally destroyed were 29, buildings considerably damaged 231, ditto slightly 489, chimnies 83, and false alarms 79; total, 901. Of these, 280 occurred in private houses, chiefly caused by bed and window-curtains igniting through the neglect of servants, 59 lodging-houses, 30 licensed victuallers, 23 coffee-shops, 20 woollen and silk-mercers, 23 sale-shops, 20 cabinet-makers, 5 public buildings, 10 bakers, 7 lucifer-manufactories, and 3 on board ships. The chief causes of fire are stated to have been carelessness of servants and defects in stoves and flues.

Fine Arts.—Mr. Baily, the Academician, has just completed a model for a statue in marble of Sir Charles Metcalfe, late Governor of Jamaica, and now Governor-General of Canada, to be erected opposite the Senate House in Spanish Town, Jamaica. The height is nine feet and the costume military. A bust in marble of Sir Charles has likewise been commissioned for Calcutta.—The colossal statue in marble of Sir A. Cooper is receiving its finish, and will be removed to its destination in St. Paul's in a few days. The site chosen is on the south side, between the monuments of Sir John Moore and General Gillespie.—The statue of Nelson in Trafalgar-square is to undergo some alteration, the cable at the feet of the Admiral being considered to require greater solidity.—The staircase of the Goldsmiths' Company has lately been embellished by the addition of four statues in marble, emblematical of the seasons, by Mr. Nixon. The last of these, that of Autumn, was raised upon its pedestal a few days since. There is some novelty in the treatment of the figures, as all the four are represented as youths.

Conference of Dissenters.—The Dissenting papers announce that a General Conference of those who are opposed to the union of church and state has been determined on. The proposal originated in the midland counties, and has been acceded to at a meeting of leading dissenters in the metropolis.

Colonial Bank.—On Tuesday a meeting was held of the shareholders of the Colonial Bank, when the half-yearly report of the directors was laid before them. The report proved far from encouraging. The bank has made numerous bad debts and losses of various kinds in the West Indies. It had been hoped that its affairs were not quite so bad as was represented to be the case by some of the proprietors at a former meeting, but the reduction of the funds of the bank has been sufficiently large to induce the board to suspend for the present the payment of a dividend. The losses made by the bank in the West Indies are now estimated at 116,000*l.*, independently of a reserved fund of 40,000*l.*, which will be applied to liquidate a portion of them. The bank in the early stages of its career paid a dividend of eight per cent. per annum.

St. Pancras.—On Tuesday at the meeting of the directors and guardians, Mr. Curtis one of the medical officers of the north division of the parish submitted to the board the alarming amount of fever prevailing in certain portions of his district on account of insufficient and improper drainage. He said that in Ferdinand-street the want of drainage was so great that the water lay in stagnant pools from which noxious and dangerous effluvia arose, and the result was that there were no less than 13 houses in that street alone infected with fever. He had been applied to by some of the inhabitants and had given a certificate as to the dangerous state of the locality through want of proper drainage, which was about to be laid before the poor-law commissioners. The churchwarden said that Kentish-town possessed a local act and the commissioners were bound by act of Parliament to carry out, throughout the district, a proper drainage. It was ultimately resolved that the clerk should forthwith call the attention of the Kentish-town commissioners to the state of drainage in the district.

Christmas Holidays.—The number of visitors to the British Museum during the late holiday week was 41,151, being on Tuesday 18,377, Wednesday 13,281, Thursday 1,633, and Friday 7,810. The number who passed through the Thames Tunnel last week was 37,114. The number of visitors to the Tower during the week was, to the armouries 911, to the jewel office 711.

The Oastler Liberation Fund.—On Thursday a meeting of the committee appointed to take into consideration the best means of effecting the release of Mr. Oastler from prison, where he has been confined for three years, and for providing for his future comfort, was held, when communications were received from the central committee of the West Riding, at Huddersfield, stating their strong convictions that energy and exertion on the part of the several localities, and at the centre of action, was alone now necessary to the consummation of their object "within the space of a few short weeks." It was further stated that the London committee were progressing favourably with regard to the collection of the necessary funds, and that amongst the subscriptions received was 50*l.* from Mr. M. Atwood, M.P.

Asylum for Female Orphans.—On Thursday a quarterly court of the governors of this institution was held, and as some important business relative to the recent contest for the chaplainship was likely to be brought under consideration, an unusual number of guardians attended. It appears that some weeks since the office of chaplain became vacant, when many clergymen announced their intention of becoming candidates. The committee inserted an advertisement in the morning papers, calling upon the guardians to vote for the Rev. S. R. Cattley. Immediately on this announcement being made, all the candidates resigned, fearing that they had no chance of success, with the exception of the Rev. W. Curling, who was determined to try the result. At the close of the day's proceedings, Mr. Curling's friends proposed a vote of censure on the committee for their interference. The resolution was put to the meeting, and carried almost unanimously. The object the committee had in view at the meeting on Thursday was to prevent the confirmation of this vote. Mr. Shadbolt took the chair, and offered a few preliminary remarks; after which Mr. Clarke rose to move that the minutes of the last meeting, at which the vote of censure was implied, should be confirmed. It had gone forth to the world, and certainly not without some semblance of truth, that no candidate had any chance of election to any office in their institution, who failed to obtain the patronage of the committee, and that so long as that patronage was allowed to continue, efficient men would never be obtained. At the election of chaplain he had nominated the Rev. S. Bridge curate of St. Mary's, Islington. From the time Mr. Bridge was proposed he had endured a system of persecution totally unworthy of the committee of such an institution, and exceedingly repulsive to the feelings of any gentleman against whom it was directed. When the committee so far forgot themselves as to circulate printed hand-bills reflecting upon a clergyman whose character was above suspicion, in order that they might secure the election of their own nominee, they could not expect that any persons with any claim to respectability would offer themselves in the event of a vacancy. The motion having been seconded, a long recriminatory conversation took place; and after some remarks from the Rev. W. Curling, the minutes of the last meeting were disallowed by a considerable majority. It was alleged that several new votes had been made to swamp the opposition to the committee.

Hanwell Asylum.—An Artesian well has been recently completed at the Lunatic Asylum at Hanwell, under the superintendence of Mr. Baker, of Westminster-road, which from the quantity and quality of the water, as well as the height to which the water rises, may be reckoned as one of the most powerful in the kingdom. The shaft to a depth of 31 feet is 10 feet in diameter, and thence to a further depth of 200 feet is 6 feet in diameter, making 231 feet. At that point a small auger was driven below into a sand stratum strongly charged with water, through which it was found necessary to force cast-iron cylinders into the clay beneath, a depth of 12 feet. At the depth of 243 feet a guide-rope was inserted and secured with brickwork, and the boring commenced with pipes of 14 inches internal diameter, which are carried down into the flints immediately overlaying the chalk a depth of 290 feet, whence the water now rises and overflows the surface at the ratio of 100 gallons per minute, and at 26 feet above the surface at the ratio of 23 gallons per minute. The temperature of the water as it overflows the surface is 55° Fahr.

St. Stephen's, Walbrook.—On Wednesday the parishioners met pursuant to the adjournment of the 15th Nov. Mr. Cunliffe the banker presided. The vestry clerk's representative was called on to produce the minutes of the select vestry held on the 22d ult., from which the parishioners were excluded by Alderman Gibbs, when it appeared that no record of that meeting had been entered on the vestry-book, and that the only minutes of it were now in the possession of Alderman Gibbs. The Rev. Dr. Croly addressed the meeting at great length, describing what had occurred in the select vestry, and censuring with great severity the whole conduct of Alderman Gibbs, not only in withholding his accounts, but in besieging the church-doors by a party of police officers. He stated that he had been offered the inspection of the accounts on the day of the recent meeting, but feeling it impossible to examine the accounts of 19 years in three hours, he had declined the task; and the only proposal made to the chair was simply that the accounts be printed, to which he of course acceded. He would mention to the parishioners a circumstance which finally stamped his judgment of Mr. Alderman Gibbs, but of which he had not spoken publicly before. In the course of these transactions he once was asked whether he knew that there was an old legacy of a guinea a-year to be paid to the rector of Walbrook for preaching a Good Friday sermon? He had never heard of it. However, meeting the Alderman some time after, and almost ashamed to speak of such a trifle, he inquired whether the bequest really existed? "Oh, yes," said he, "it does; but you and I settled that long ago over a chop." Now not comprehending this settlement and feeling that he could not have settled a thing of which he did not know the existence, he sent his collector to the Alderman, who then paid the eight guineas—a guinea for every year of his incumbency. Mr. Rock stated that a deputation had waited on Archdeacon Hale to know whether he had given authority for the exclusion of the parishioners from the church on the 22d ult., that the Archdeacon stated he had been informed that a select vestry existed in Walbrook, and being asked whether it had the power of preventing others from intruding, gave it as his opinion that "any body of men meeting for the discharge of their peculiar duties had the power of so doing." This was evidently no authority for excluding the parishioners from the church, nor did the Archdeacon intend it as such. Since then Mr. Alderman Gibbs had been a suppliant at Mr. Rock's feet, apologising for his conduct, and asking for further time to file his answer in the Court of Chancery. Should he give it? (Several voices, "No, no.") Then he would not give one second, and if the answer was not filed, there was no other alternative but the Queen's Bench. It was then resolved unanimously, "That the payment of the 1*s.* and 1*s. 6d.* rate, lately levied by the select vestry, be resisted until the accounts of Alderman Gibbs were produced."

The late Duel.—On Wednesday the sale of Lieut. Munro's effects, which was prevented a fortnight since by the Coroner, commenced and concluded without interruption. Mr. Wakley did not make his appearance.

The Gas Companies.—On Thursday evening the adjourned meeting, which was convened in pursuance of a requisition presented to the churchwardens, to take into consideration the present mode of supplying the public with gas, and to devise if practicable some mode of establishing a standard of purity and measure for the same, took place in the vestry-room of St. Martin's-in-the-fields. Dr. Jones was called to the chair, and stated that one of the principal grievances which not only the householders of that parish laboured under, but every consumer of gas throughout the United Kingdom, was, that great partiality existed in its supply, those who burn by meter having to pay much more than those who are supplied by contract. He maintained that all alike should burn by measure, and that such measure should be regulated by some government enactment, like that which now kept in check the fraudulent tradesman from using other than authorised weights and measures. So far as regarded the gas-meters at present in use, nearly all, if not all, were deficient; and what was the course pursued by the companies? Why they compelled every consumer ere they permitted his putting a meter up to send it to the directors to be tested by their officers. The conse-

quence in almost every case was, that a meter was pressed upon the consumer's premises which would measure gas to a very large amount against the purchaser, and that so soon as it rose to the fair, or water line, it refused to register in his favour. He submitted that such a state of things ought not to be tolerated. Nor is the gas as pure as it ought to be. The first one or two hours the coal used gives off pure gas; the next an inferior description; and after this a quality highly detrimental to the health and to the purity of the light was manufactured. Yet there was no control over these things. In Brussels, on the contrary, and perhaps in other continental cities and towns, a law existed which kept in check the cupidity of the companies. Where gas was supplied of a bad quality, the consumer was compelled to burn three and four times as much as otherwise to obtain a sufficient light. Mr. Wilson said he did not like the tendency of these meetings. It was evident to him that they breathed a desire to give too great a power to Government. Several other gentlemen then spoke, after which resolutions were carried with the view of following up the object in question, and amongst them was one to the effect that a committee be immediately formed to meet and confer with other parishes.

Robbery.—Between 4 and 5 on Thursday afternoon a clerk in one of the London private banking-houses was robbed of his case, containing several sums of money, while on his way from Princes-street to Cornhill. The exact amount is not known, but it is said that the case contained amongst others one sum of money amounting to between 1,200*l.* and 1,300*l.*, that had been paid to him at one of the leading joint-stock establishments. The receipt of money closes at the City banks daily at 4 o'clock, in order to be in time for the clearing; but a large extent of monetary transactions takes place after that hour, and chiefly from 4 to 5, between the Bank of England and the joint-stock banks with the private banks; and it is now ascertained that this part of the banking system of London has come to the knowledge of a gang of thieves, who have long been on watch and have at last committed this robbery.

Accidents.—The daily papers announce that the Hon. Capt. Rous is recovering from the effects of his late accident, and that he will not lose the sight of the injured eye. It has been incorrectly stated that the misfortune was occasioned by the gun bursting, which was not the case; it exploded while in the act of reloading, and the ramrod wounded the finger which has since been amputated, lacerated the eyebrow, and passed through the rim of his hat. The Captain's escape was almost miraculous; had his head been a trifle more advanced, the consequences must have been fatal.—The Dowager Lady Geary, while driving near Hadlow, Kent, last week, had an escape from a serious accident by the horses of her carriage taking fright. They cleared two gates, dragging the carriage after them, when one at length fell, and her Ladyship was rescued from her perilous situation with no injury beyond a few slight bruises.—On the 29th ult., when Sir Richard Sutton was hunting at Greetham, near Oakham, his horse, whilst taking a fence, accidentally put his foot into a deep blind ditch, and threw the Baronet with great violence over his head. It was feared, from the severity of the fall, that Sir Richard had broken his thigh, but although one of the knees is severely injured, he is likely to resume his field sports before the end of the season.—During the thick fog which prevailed a few evenings since, the carriage of Lady Grenville, who was returning to Dropmore from a dinner party at Huntercombe-house, Bucks, was upset by being driven upon a steep bank, close to Burnham, about two miles from her residence. Such was the position in which the carriage was overturned that the footman and coachman found it impossible to extricate Lady Grenville from her perilous situation without additional assistance, which was procured from the village. Her Ladyship, who has attained a very advanced age, received several severe contusions from which she is still suffering.—The provincial papers state that a fish-bone has been so firmly fixed in Mr. Feargus O'Connor's throat since Thursday week that all efforts have failed to remove it. His medical attendant deems his situation so precarious that he has ordered him to abstain from all conversation.—The Cork papers state that on Thursday, the 21st, as the Earl of Mountcashel was returning from the mountains where he had been shooting, the horse took fright, and running down a hill the carriage in which he was seated came in contact with a stone fence at the side of the road, with such violence as to separate the two hind wheels from the body, and his Lordship was dashed out with considerable force. He was taken up insensible by some persons who were passing, and carried into an adjacent cottage. He was severely cut and bruised, and for the last week was confined to his bed suffering much pain, but is now out of danger.

Mortality of the Metropolis.—The number of deaths registered in the week ending Saturday, Dec. 23, was as follows:—West Districts, 126; North Districts, 185; Central Districts, 194; East Districts, 224; South Districts, 239; Total, 968 (males, 478; females, 490). Weekly average for the last five years, 903 (461 males, 442 females); and for the last five autumns, 908.

Provincial News.

Incendiary Fires.—In Bedfordshire, on Saturday week, at Newberry Farm, near Selsoe, in the occupation of Mr. Squire, a rick of barley destroyed; and nearly at the same time at Maulden, two miles distant, on the farm of Mr. Kempton, a barn containing a large quantity of corn destroyed.—In Essex, on Thursday, at Writtle, on the farm of Mr. R. Baker, a stack of wheat, the produce of 12 acres, destroyed; at Great Easton, on Wednesday evening, on the premises of Mr. Turner, of the Manor Farm, some out-buildings destroyed.—In Notts, on Sunday night, on the farm of Mr. Robinson, of Arnold, a straw-stack destroyed.—In Kent, on Saturday, on the farm of Messrs. Benton, at Barrow-hill, near Ashford, two wheat-stacks destroyed.—At Alford, on Friday, on the farm of Mr. Rowell, of Bilsby, the stack-yard and several stacks destroyed.—At North Grimstone, near Walton, on the 30th ult. a stack of straw in the stackyard on the farm of Mr. Johnson, destroyed.—On the 14th ult. a stack of wheat, the property of Mr. David Evans, of Llanidloes, destroyed.

Bedford.—The magistrates of this county and of Hertfordshire have determined on instituting legal proceedings against a man named Burke, of trotting notoriety, who engaged a fortnight since to trot his pony against the Bedford coach. The terms of the match were, that Burke should drive his pony in harness, and start from the Swan at Bedford at the same time with the coach, to proceed to the George and Blue Boar, Holborn, and return the same day with the coach to Bedford, and then to start the next morning from Bedford with the coach and to arrive in London first. The match commenced on Monday morning, the pony and the coach leaving Bedford together at a quarter past 8, and Burke drove up to the George and Blue Boar about 20 minutes before the arrival of the coach, the distance being 52 miles, performed in 5½ hours. After having been fed, the pony was brought out to start with the return coach for Bedford. The coach left town accompanied by the pony, and travelled together till within 20 miles of their destination, when the pony indicated great distress, but continued on to Shefford, 9 miles from Bedford, when it fell dead from exhaustion.—At the quarter sessions on Tuesday the report of the visiting justices was brought forward, in which a proper classification of prisoners and the establishment of separate cells of proper dimensions and under judicious regulations as to the intercourse of prisoners was recommended. After some discussion a committee of magistrates was appointed, with power to call in the aid of Major Jebb, with the view of carrying out the proposed alterations in prison discipline, and it was also resolved that a special session be held on the 1st March for the decision of the question.

Boston.—The annual general meeting of the Boston Agricultural Association was held on Wednesday, and was attended by a large body of its supporters. Mr. Gee, the President, took the chair. Petitions to both Houses of Parliament against any further reduction of the protective duties on British Agriculture, and calling upon Parliament to resist the efforts now making by the Anti-Corn Law League, were adopted; and it was resolved that the Peers and Members connected with Lincolnshire should be requested to support the petitions.

Bolton.—A meeting in favour of free trade was held in this town on Wednesday, at which about 500 persons were present. Mr. Gregson presided, and Col. Thompson, Mr. Cobden, and Mr. Moore, addressed the meeting at great length. The amount collected was 1,205*l.* 4*s.* 9*d.*

Bristol.—On Saturday morning the inhabitants of Clifton-road were alarmed at hearing a noise similar to the rumbling of thunder, which arose from the falling of one of the new villas erecting in Clifton-road. At the time of the accident there were six men employed on the building, five of whom escaped unhurt; but one was buried beneath the fallen mass, and killed. From the evidence given at the inquest it would appear that the accident was occasioned by the rottenness of the stones and other materials used in the lower part of the building. The house was built for sale, and was run up in the slop style. The Jury returned a verdict of "Accidental death," at the same time requesting that the depositions should be sent to the mayor and magistrates for them to take what steps they judged proper.—The steam-ship Great Britain is at length definitively appointed to proceed on her first voyage from England to New York on the 25th May next. Some conception of the vastness of her size may be formed from the fact that her burden is 3,500 tons and her engines 1000-horse power, whilst those of her sister ship the Great Western are respectively 1600 and 450. Captain Hosken the present commander of the Great Western will take the command of the Great Britain. It is a source of disappointment to the Bristol people, that although their city has all the honour of projecting and constructing the Great Britain, Liverpool will have the credit of first sending her to sea. It is understood that the Great Britain will visit the Thames in the course of a few weeks, in order to display her gigantic portions and internal fittings to the inhabitants of the metropolis.

Cambridge.—The Earl of Hardwicke has contradicted the paragraph originally inserted in a provincial journal, to the effect, that at a late rent-day dinner he had expressed his opinion that free-trade principles would ultimately triumph, but that such a result would not be so disastrous as generally anticipated. His Lordship states that he uttered no such sentiment.

Gloucester.—At the quarter sessions on Tuesday the new dietary introduced into the gaols throughout the county by order of the Home Secretary formed the subject of discussion. The subject was introduced by the chairman, who said that the dietary, although fixed by Sir James Graham after consulting the most eminent physicians and surgeons in the kingdom, and ordered to be introduced into all gaols and bridewells throughout the country as a great improvement on previous dietaries, had no sooner been introduced into the gaols of Gloucestershire than great complaints were heard of it from the prisoners. A presentment on the subject of the enlargement of the several gaols and bridewells, including the building of a considerable addition to the County Gaol and Penitentiary at Gloucester was then read and resolutions in conformity thereto were passed. The magistrates then proceeded to consider the recommendation of the Home Secretary after the late inquiry at Northleach to consolidate the Houses of Correction throughout the country, and establish a Model Prison on the plan of that at Pentonville. The chairman said he for one was not prepared to carry out the Government recommendation, which might be very well adapted for London and other large towns where the population was exceedingly numerous, but was not at all suited to the county of Gloucester and its rural districts where the population was very thinly scattered. He insisted that the various prisons throughout the county were indispensable, and ought not to be abolished. He also contended at great length that the prisoners throughout the county had been treated with kindness and humanity, and had no ground of complaint. Whatever might be the general government of the Model Prison, it was not at all suited to the habits of the prisoners in the various prisons in Gloucestershire, and the discipline of their new prisons was looked upon as exceedingly mild and humane and the punishment very light compared with that of the Model Prison in London. He concluded by moving that the recommendation of the Secretary of State be negatived, and the plan of a model prison for the county be rejected, and that other plans and estimates for the enlargement of their prison be submitted to the Secretary of State for his approbation. The chairman then explained the plan to the court by which additional accommodation would be afforded for nearly 500 prisoners. Although the expense would be great, it would be much less than the Government wished the Court to adopt, and at the same time the visiting magistrates would be enabled to carry out one portion of the recommendation of the Secretary of State, while the system of tread-wheel labour, of which the magistrates approved, would be continued. The Lord Lieutenant of the county (Earl Fitzhardinge) fully concurred in the sentiments of the chairman, and seconded the rejection of the Government plan, stating that he was fully satisfied with the present system of prison discipline throughout the county. An animated discussion followed, in which a number of magistrates expressed their opinions relative to Beale's case at Northleach and the prison discipline of Gloucester and that in operation at the Model Prison. Amongst other magistrates who took part in the discussion was Mr. Bengough, who wished to see the Government plan carried into full operation. He considered the Model Prison was a perfect and most admirable system, and the discipline extremely beneficial. It trained the prisoners to habits of industry, and taught them useful occupations, so as to enable them hereafter to earn an honest livelihood. The chairman in reply to several questions said Government could not force the plan upon them, and the only way they could compel the county to build a model prison was by Act of Parliament, which if the county members did their duty the Government could never obtain. The rejection of the Government plan was then carried by a large majority.

Huddersfield.—Lord Ashley's bill for the prohibition of women working in mines and pits came into operation in March last, since which time nothing of the kind has been heard of. Last week however the first infringement of that act that has been brought forward was heard before the magistrates at this place. Mr. J. W. Moorhouse, coalpit-owner of Wooldale, was summoned by George Haigh, a constable of Almondbury, for having on the 15th Nov. employed or suffered to be employed in Lidget-pit, as "hurriers," four girls under 17 years of age, who were dressed as boys and so completely disguised that it was difficult to distinguish them. The case was fully proved, and the poor girls were examined but were found to be so ignorant that they knew not how long they had worked in the pit; they knew nothing of the month of November; they had given over working six weeks since, but they recollected seeing the constable in the cabin; they worked there three days after that and were "hurriers." This being the evidence the magistrates convicted in the lowest penalty prescribed, viz., 5*l.* in each case, making 20*l.* and the expenses.

Ilford.—Thursday week a meeting of the select vestry of this parish was held for the purpose of taking into consideration the memorial lately presented to the Bishop of London and his Lordship's letters in reply. After some preliminary matter Capt. Gilmore moved a resolution that every attempt having been made in the most conciliatory manner to induce the vicar to return to the accustomed manner of performing divine service, but without effect, the churchwardens be requested to move the credence table and restore the reading desk and clerk's desk to their former state. The resolution having been seconded by Mr. Paulin, considerable discussion ensued, in the course of which a letter from the Bishop to the churchwardens was produced, in which his Lordship requested the churchwardens not to remove the credence table without further directions from him. The vicar admitted he had informed the Bishop that the opposition to the credence table proceeded from a "faction" and that it was not generally desired by the communicants, adding "I for one should like to see the Church and State separated to-morrow." A member of the vestry asked whether he had understood the rev. gentleman aright, when the vicar replied that he did not mean to use the word "to-morrow" literally, as all sudden changes were bad. He said that in the present state of things the union of the Church with the State was only an incumbrance to the Church, and that unless the Church had the power it possessed 300 years ago, when the liturgy was composed, he should be glad to see the union dissolved, and added that it would be done within the next

25 years. The rev. gentleman was repeatedly entreated by different members of the vestry for the sake of peace to give up the weekly offertory, a liberal contribution to the monthly collection on Sacrament Sunday being offered in lieu of it; but he refused to give way in the slightest degree, observing that he was "the vicar of the parish, and that it was the duty of the parishioners to obey him in spiritual matters." The resolution was then put and carried unanimously. It was also resolved unanimously "that the pew-opener, beadle, and other officers paid by the parish, be discontinued at the expiration of their year of office, and that in the meantime they be directed to discontinue carrying round the plates at the weekly offertory." In consequence of these resolutions the church on Sunday last was almost deserted.

Leeds.—A statement which excited a good deal of public attention recently appeared in the local papers, charging an alderman of this borough and a member of the watch committee, with not only being cognizant of the disturbances of August, 1842, previous to their commencement, but with having been actually instrumental in producing them. The statement was first made public by Mr. Hobson, publisher of the *Northern Star*, and a member of the Town Council, at a public meeting held in Leeds a short time ago, and on Monday the subject came under discussion in the Council, where Mr. Hobson reiterated his statement, stating that the remarks applied to Alderman Bateson. From the explanations of Mr. Hobson, Mr. Bateson and others, it appeared that the charge had been preferred by a person named Smith, who had been made a bankrupt by Alderman Bateson, and who, it was contended, could not be believed. After a great deal of altercation, the Council decided that the matter did not come within their jurisdiction.

Leicester.—At the general quarter sessions for this county held on Tuesday the question as to the propriety of affirming the presentment carried at the last session for the amalgamation of the County Gaol and House of Correction was brought forward and after a long discussion carried by a majority of 19 to 4.

Liverpool.—The particulars of the late fire received this week are more disastrous than at first anticipated. One man was killed by being buried under the ruins, and several others have been taken to the infirmary with serious injuries. The loss sustained, including the buildings, machinery, goods, &c., is estimated under 70,000*l.*, of which 32,000*l.* are insured.—The appointment of official assignee of the Liverpool District Court of Bankruptcy, vacant by the removal of John Follett, Esq., to London, has been conferred upon George Morgan, Esq., of Bristol.

Maidstone.—On Tuesday night Sir Walter Riddell, Bart., was returning to his residence at the palace, when on passing the mill-head of Messrs. Mercer and Parton's mills he met a man and woman, and immediately afterwards heard a splash in the water and a cry of distress. Sir Walter hastened to the spot, and seeing something on the surface of the water, which is at this spot about six feet deep, and runs with a rapid current under the mill, without hesitation he plunged in with all his clothes on, and succeeded in saving from a watery grave the woman whom he had passed just before.

North Wales.—We must not omit to mention among the incidents of Christmas, that Dr. Thackeray, whose plantations have acquired such well-earned celebrity, has this year, according to his annual custom, placed clothing to the value of 35*l.* at the disposal of the small parish of Nerquis, to be distributed as he thinks proper to his poor neighbours.

Northampton.—On Thursday last, a young man named Thomas Katterns, a weaver residing at Kettering in this county, voluntarily surrendered himself to the authorities, confessing the commission of an act of incendiarism perpetrated five years ago. He stated that the consciousness of the crime pressed so much upon his mind that he had come to the resolution of confessing all. A person who seems to have been in the secret, corroborated the account of Katterns, who was committed for trial.

Nottingham.—On Sunday afternoon several convicts made their escape from the county gaol in this town. Between 4 and 5 o'clock on the second turnkey going down into the felons' yard an attack was made upon him, the key taken out of his hand, and he was locked in the yard. Six convicts rushed up the steps and proceeded to the outer door, where, meeting with the head turnkey, they fell upon him, knocked him down, and forcing the key from his hand they unlocked the door and ran out. An alarm was given, but they all escaped. Three of them, Smith, Bowers, and Binns, were convicted of the burglary at Sutton Bonnington, at the house of the Rev. R. Meek, and were sentenced to transportation for life at the late assize. The fourth, Thomas Burton, was under sentence of transportation for 15 years for stealing ten hogs at Farnsfield. The fifth, William Thompson, was convicted at the late assize of burglary at Fiskerton, and sentenced to be transported for 10 years. The sixth, Thomas Green, was convicted of burglary at Fiskerton, and sentenced to transportation for life. The convicts all had the prison dress on, and were without hats.

Oldham.—On Tuesday evening a public meeting was held in the Town-hall in aid of the Anti-Corn-law League fund of 100,000*l.* Mr. Gillham, head constable, presided. The meeting was addressed by Col. Thompson, Mr. Cobden, and Mr. Moore, and subscriptions were announced to the amount of 866*l.*

Oxford.—The delegates in congregation met on Wednesday, when the Master of University College, the chairman, pronounced the judgment of the Court in the case of Hampden, appellant, *v.* Macmullen. That the amended libel was wrongly admitted, the delegates being of opinion that there were no allegations on the face of the libel on which any legal duty was grounded for the breach of which an action on the case for damages would lie; they therefore reversed the judgment of the assessor in the Court below and ordered the amended libel to be dismissed, Mr. Macmullen paying the costs of both parties. Mr. Cary on the part of Mr. Macmullen gave notice of further proceedings by an appeal to a higher Court—that of the delegates in convocation. The above decision is of course hostile to the Tractarian party.

Plymouth.—On Tuesday night the premises of Mr. Hicks, wine-merchant, Bilbury-street, were broken into, and cash to the amount of 70*l.* in notes and gold stolen therefrom. No one resides on the premises, which extend to Kennell-street, in the rear, where the burglars scaled a wall about 10 or 12 feet high, and having dropped into the yard, removed a pair of steps to the curtilage, and went through a first-floor window. No obstacle now prevented their gaining access to the office in front, and there they set to work to detach a ponderous cast-iron chest from its place, within one foot from the street-window. This must have employed them some time, as a quantity of bottles and barrels were removed to avoid increased noise. When it was detached, an iron poker was placed under a nest of shelves, previously supported by the chest, which was carried to a small cellar behind, covered with a horsecloth, and one side broken in by repeated blows. An iron inner partition prevented their obtaining their object by this opening, and they turned the chest and broke into it on the opposite side. The contents of the cash-box were then carefully assorted, all bills and unavailable papers left behind, and the cash only taken away. There is little doubt that the robbery was effected by a gang of experienced burglars who have lately visited this neighbourhood.

Portsmouth.—The Lords of the Admiralty are preparing, not only a new set of naval regulations and instructions, but also a general code of port orders, for which purpose a clerk from the Admiralty has recently visited each of the out-ports, and examined into the local orders. It is intended to deliver a copy of the port orders to every captain immediately he has commissioned a ship, so that the difficulty at present experienced by a captain on first joining his ship, arising from his uncertain knowledge of his first act of duty will be obviated, and officers be no longer called upon to copy three or four hundred written general orders, of which perhaps not one half are in force or of any utility.

Rochester.—On Monday the Rev. Henry Winter, chaplain to the Fortitude convict-ship, together with Mr. G. Bassett, army butcher, residing at Chatham, appeared before the magistrates in this city to answer informations charging them with disposing of a heifer on the 25th Nov. being unfit for food. Witnesses proved that the Rev. Mr. Winter resides on board the convict-ship off Chatham dock-yard, and occupies two farms in Chatham parish; that he has had several heifers which died of a disease called the "murrain," and had been sold to butchers; that the animals were in a state totally unfit for human food, and that on the 25th Nov. one of their carcasses was driven in Mr. Winter's cart to the house of Mr. Bassett. After hearing this evidence the Magistrates bound over the defendants in the sum of 40*l.* each to appear in a week, and adjourned the inquiry for the production of further witnesses.

Sudbury.—An inquest has been held in this town on the body of a boy named Joseph Clark, in the employ of Mr. Simon Viall of Middleton-hall a short distance from the town, who was said to have come to his death in consequence of blows and kicks inflicted by his master, a farmer occupying it is said 700 acres of land. The boy expired at his father's house in Sudbury on Sunday the 24th ult. The investigation was carried on for four days and at the conclusion on Friday the Jury returned the following verdict:—"The Jury after four days' careful investigation are unanimously of opinion that Joseph Clark deceased, on whom this inquest has been held, came by his death from a kick or blow given him by Simon Viall of Middleton-hall in the county of Essex, and that the Jury return a verdict of Manslaughter against the aforesaid Simon Viall."

Windsor.—The Commissioners of Woods and Forests have just purchased the whole of the extensive and valuable property belonging to the Keppel estate, which consists of 170 acres of the most valuable land in the borough. This purchase has been made preparatory to the carrying out of various extensive improvements which for years have been in contemplation. The parish of Windsor consists of 2460 acres, out of which there are no less including the Keppel property than 2170 acres belonging to the Crown, which leaves 290 acres only chargeable with the poor-rate.

Worcester.—The local papers have lately contained long accounts of a mysterious robbery at the seat of the Earl of Beauchamp. The police have thoroughly investigated the circumstances, but at present nothing has transpired to fix the theft upon the guilty party, though from the fact of a considerable quantity of wine having been stolen the opinion gains ground that the thief was one well acquainted with the interior of the mansion. The cash-box was found in a ditch between the chapel and the front lodge, 200 or 300 yards from the house. All the keys were in the box, and as the lock was uninjured it is supposed that his Lordship unintentionally left it unfastened, for the lock could not have been picked.

Railways.—The following are the returns for the past week:—Birmingham and Derby, 1,516*l.*; Birmingham and Gloucester, 1,899*l.*; Eastern Counties, 3,157*l.*; Edinburgh and Glasgow, 1,822*l.*; Great Western, 15,692*l.*; Grand Junction, 3,166*l.*; Glasgow, Paisley, and Ayr, 1,092*l.*; Great North of England, 1,668*l.*; Hull and Selby, 970*l.*; London and Birmingham, 18,267*l.*; South Western, 6,216*l.*; Blackwall, 667*l.*; Greenwich, 679*l.*; Brighton, 3,920*l.*; Croydon, 324*l.*; Liverpool and Manchester, 3,817*l.*; Manchester and Leeds, 1,634*l.*; Midland Counties, 2,881*l.*; Northern and Eastern, 1,876*l.*; North Midland, 4,976*l.*; South Eastern, 3,393*l.*; Sheffield and Manchester, 474*l.*; York and North Midland, 2,134*l.*—From a return made to the House of Commons last session, it appears that the railroads in England and Wales, 56 in number, paid in the year ending January 5, 1843, no less than 152,663*l.* 13*s.* 0¾*d.*, as passenger duty. The increase of railway traffic within the last ten years may be gathered from the fact, that in the year ending January, 1833, the whole sum paid to Government as passenger duty was 639*l.* 16*s.* 10*d.* The amount paid in the year ending January, 1842, was 148,204*l.* 13*s.* 10½*d.* In Scotland, in the year ending January last, 20 railroads paid 15,125*l.* 1*s.* 6½*d.*, being an increase of 3,468*l.* 0*s.* 11*d.* over the preceding year. The gross amount paid by all the railroads in the kingdom during the last year was 167,788*l.* 14*s.* 7¼*d.* The amount paid in the previous year was 159,861*l.* 14*s.* 6*d.*, showing an increase in 1843 of 7,927*l.* 0*s.* 1¼*d.* The ten railroads terminating in London paid 82,447*l.* 4*s.* 5*d.*: the three largest amounts being paid by the London and Birmingham, the Great Western, and the South Western, which paid respectively 25,940*l.* 14*s.* 1*d.*, 25,804*l.* 5*s.* 2*d.*, and 12,043*l.* 19*s.* 7*d.*, or more than two-fifths of the whole amount.—On Saturday a special general meeting of the South Western company was held to take into consideration the propriety of extending the line to Salisbury, Newbury, and Epsom. The report stated that the proposed line to Epsom by the construction of five miles of railway, touching at Ewell, would bring Epsom within 14 miles of Vauxhall, the cost being estimated at 51,000*l.*, the traffic at 5412*l.* per annum, of which a large amount would be derived from carrying visitors to the races. The proposed Salisbury Railway, from the Bishopstoke station, by Romsey, somewhat under 22 miles, might be completed for 230,000*l.* having the advantage of forming a good communication between Portsmouth and Southampton. The estimated revenue from traffic would be 25,000*l.*, of which 14,000*l.* would accrue from passengers, so that allowing 40 per cent. for working expenses, there would be 7 per cent. profit on the investment. A branch to Guildford was also contemplated but no proposals on that subject would be made at present. The report was received with satisfaction, and power was given to the directors to apply to Parliament for the construction of the Epsom and Salisbury branches.—A special meeting of the Manchester and Leeds Company was held last week at which the directors were empowered to make arrangements for the construction of branches to Bury, Bradford, and Huddersfield, and also to accede to the terms proposed for the union of the Manchester and Leeds with the Hull and Selby Company. The leading points of the contract are as follow:—that both Companies shall lease their respective lines to a new firm; that the new firm shall consist of a board of directors, constituted of the whole of the Manchester and Leeds directors, and of two directors of the Hull and Selby Company; and that this board shall conduct the business of the joint companies, using their lines, stations, and all their engines, and conducting the whole business; but that as respects capital, each company shall remain as it now is, a distinct individual company; that these two companies shall share in the net receipts of the associated company in proportions of 16⅔ per cent. to the Hull and Selby company and 83⅓ per cent. to the Manchester and Leeds company; that all future capital, including the capital expended in the Hunt's Bank extension and the Halifax branch, shall be provided by the two companies in the proportion of their shares in this associated company. So that each company will remain a distinct company on all points connected with capital, while the associated company will work the traffic, pay the expenses, manage all the business, and at the end of the year divide its receipts into two sums, which are to bear to each other the proportion of 16⅔ to 83⅓, and pay them over to the directors of each company, who are to dispose of such shares to their respective proprietors.—An order has just been issued from the War office intimating that arrangements have been entered into by Government with the Birmingham, Great Western, Brighton, Dover, Grand Junction, North Midland, Midland Counties, Northern and Eastern, Eastern Counties, Birmingham and Derby, Manchester and Birmingham, Birmingham and Gloucester, Manchester and Leeds, York and North Midland, Lancaster and Preston, Newcastle and Carlisle, and Great North of England railways, for the conveyance of the horses of field and staff officers and infantry, when proceeding by route with regiments and detachments on railways; and likewise for the conveyance of sick horses of cavalry regiments. The rates of conveyance are fixed as follow:—For any distance not exceeding 50 miles, 4*d.* per mile for each horse; for beyond 50, and not exceeding 100 miles, 3½*d.*: and exceeding 100 miles, 3*d.* The route or order of the commanding-officer of the regiment or detachment is to be produced at the railway station as the authority for the conveyance of the horses, and the written appointment of the principal veterinary surgeon in regard to the sick horses is to be annexed to the charge in the public account for such conveyance. The regulation will have effect from the commencement of this year.

IRELAND.

Dublin.—On Monday the Lord Mayor for the current year Mr. Timothy O'Brien, a staunch Repealer, was sworn into office with the usual formalities. After some preliminary proceedings the late Lord Mayor, Mr. George

Roe, addressed the assemoly at some length, chiefly in reference to the pending state trials. He said he looked upon them with the deepest anxiety; and after considering the subject in all its bearings, he had come to the conclusion that it would be for the benefit of the country —nay, of the United Kingdom at large—that these trials should not take place. He felt that they would produce excitement and agitation, and lead to all the evils consequent upon such a state. In the midst of such agitation as these trials would lead to, the country could not apply itself to the promotion of commerce or agriculture. He would tell the assembly that after being in communication with men of all parties since the prosecutions had commenced, he firmly believed it to be the general desire that the agitation of the country should be prevented by the abandonment of those trials. He felt extreme delicacy in saying anything that might be considered trenching upon the administration of the law which he felt to be sacred ground; but he considered that an expression of public feeling under all the circumstances would be calculated to serve the country. He would therefore move that the Corporation petition the Queen praying her Majesty to grant an amnesty for the past and to appoint a committee if necessary of the whole House of Commons to ascertain the causes of discontent which unhappily prevailed. This motion was seconded by Alderman Boyse and carried unanimously.—On Wednesday, being the day fixed for striking the special jury, the law advisers of the traversers applied for further time, and for a copy of the list drawn up by the Recorder. Mr. Mahony, Mr. Ford, and Mr. Cantwell, severally declared that repeated applications had been made to the sheriff, the clerks of the peace, and the Recorder, without effect. The High Sheriff (Mr. Latouche) said he was only anxious to do equal justice to both parties, and considering the responsibility of his position, he decided upon giving the list only on receiving the consent of both. He did not consider he was directed by the act to give the panel, but he had come to the decision of giving it to both, but not to one or the other. If, therefore, the parties applied to him he would give it to both. After some further conversation, it was finally arranged that a clerk should attend on the part of the Crown solicitor, at the office of the sub-sheriff, with Mr. Cantwell, one of the attorneys for the traversers, to make copies of the special jury list, which would be compared and certified by the High Sheriff, and Thursday at twelve o'clock was fixed for striking the special jury. In the course of the proceedings Mr. Latouche stated that he had a general jury book, and also a special jury list, in compliance with the act of Parliament, that it was from the latter the jury would be struck. After this decision nine clerks were set to work in the sheriff's office copying out the special panel, which consisted of 717 names. It is said there were about 450 Conservatives, and the remainder Liberal Protestants and Roman Catholics. On Thursday morning the striking of the Jury took place in the Queen's Bench Office. Several of the traversers were present with their counsel and agents. The press were excluded except one reporter on each side. The 717 jurors composing the panel being indicated by numbers or cards were counted, and put into the ballot-box. The drawing of the names was then proceeded with and after several objections which were made by the traversers, on the ground of non-residence, the following were drawn out. Those marked with a * were objected to by the traversers:—John Boaian, merchant; *George W. Boileau, druggist; *James Hamilton, wine-merchant; Laurence Gorman, grocer; *John Boileau, druggist; James P. Smith, law-student; *James C. Papworth, architect; *Captain Edward Roper; *Stephen Parker, pawnbroker; *William Ring, brazier; *James C. St. George, wine-merchant; *Edward Clarke, Esq; *Benjamin Eaton, builder; *J. Tuwaites, soda-water manufacturer; *Jas. Hamilton, ironmonger; *J. Irwin, Esq, M.D.; *F. Faulkner, grocer; *John Croker, merchant; James Fallon, Stoney Vatter; *Robinson Carolin, builder; *John Fry, coach-trimming manufacturer; *William Hardwick, merchant; John Fitzpatrick, grocer; *H. Flynn, pianoforte-maker; *H. Thompson, wine-mercht.; M. Runne, brazier; *A. Kyd, china-warehouseman; *N. M. Macdonald, wine-merchant; John Duncan, wine-cooper; *John Rigby, gun-maker; *Robert Hanna, wine-merchant; *John Wolves, merchant; *George Whittaker, Esq.; *Robert Chambers, W. T. Camlie, jeweller; *R. S. Stubbs, linen-draper; J. W. M'Cormick, Esq., merchant; *Wm. Sult, upholsterer; *John White, seedsman; *William M. Woodruffe, merchant; *George Mitchell, tobacconist; *James Waller, engraver; *John Carolin, builder; *George Fowler, merchant; John M'Gloin, grocer; Timothy Green, publican. The list was to be reduced yesterday to 24.—The opposition papers last week contained a statement that the Cabinet had resolved on the recal of Earl de Grey from the Viceroyalty of Ireland. The Ministerial Journals, however, say that "there is not one word of truth in the story, or even a shadow of foundation for it."—Sir George Hayter after engaging a suitable place in Dublin for the exhibition of his picture of the House of Commons has declined to do so, on the ground of the disturbed state of the country.—For several weeks the opening of the atmospheric line from Kingstown to Dalkey has been interdicted by the Lords of the Treasury, owing to the remonstrances of parties owning property on the line. Mr. Walker the engineer has arrived in Dublin, having received instructions from Government to hold an inquiry on the subject.—The commissioners of police have given notice that in future the luggage of all passengers coming from England must be examined to prevent the clandestine importation of arms.—The Repeal Association met as usual on Monday. Mr. J. O'Connell adverted to the speech delivered by the late Lord Mayor on that day on retiring from office; and on the part of the traversers disclaimed all anxiety for the intercession of the corporation or any other body of men with the Queen, in favour of the gentlemen against whom the state prosecutions had been commenced. The people's leaders had committed no crime; and much as they revered and respected her Majesty they could not therefore supplicate her prdon. Mr. Steele fully concurred in these sentiments. Mr. J. O'Connell read two letters from his father, expresing his gratification at the recent adhesion to the Repeal cause of Mr. Smith O'Brien, Mr. O'Neill, of Bunoen Castle, Col. Caulfield, and other gentlemen; and inclsing his subscription to the Repeal rent, and those of 5 grandchildren. After several letters had been read and remittances acknowledged, Mr. J. O'Connell spoke at some length on the subject of a recent article which had appeared in the "Edinburgh Review," and which he attributed to Mr. Trevelyan, who he said some time ago published some letters calumniating Ireland in the *Morning Chronicle*. He moved the insertion of extracts from the article on the minutes of the Association. The rent for the week was announced to be 289*l.* 2*s.* 2*d.*

Finnoe.—A poor man named James Ardill, who held the situation of ploughman to Mr. Joseph Falkiner, of Rodeen, near Finnoe, the scene of the late tragedy, was murdered last week when within a few doors of his own cabin and in the hearing of his family. He was overtaken by a party of men, who immediately fell upon and murdered him by striking him several blows on the head with weapons called "skull crackers," any one of which would have been quite sufficient to cause instant death. His wife and children on hearing his shrieks rushed to his assistance only in time to discover him a corpse. At the inquest, after the widow had given her evidence, the magistrate said that if her testimony was sufficient to answer the purpose of the inquest, he would not offer any other witness for examination. The foreman of the jury said "I did not like to ask the question if he had a dispute with any person. If I was upon an inquest in any other country I would do it; but it would not be safe for any person here to put the question. I would rather leave it for private examination." The Magistrate: "I would rather not send any more evidence." The Foreman: "Our verdict is—that this is a barbarous and brutal murder by some persons unknown."

SCOTLAND.

Edinburgh.—It is announced that Mr. M'Donald's scheme for the erection of 500 schools, in connection with the free church is making favourable progress. It has been resolved to raise 50,000*l.* for this purpose, and already 20,000*l.* of this sum has been obtained.—On Wednesday week the indictment for trial was served on Mrs. Gilmour in the prison in this city. The trial is to take place on the 12th instant.—The *Scotsman* states that an individual died here a short time since, who obtained an unenviable notoriety more than 20 years ago. This was the Hon. and Rev. Percy Joselyn, Bishop of Clogher, who was indicted for a crime committed in London in 1822, forfeited bail and fled, was degraded from his ecclesiastical dignity, and has never been heard of till now. He lived under the assumed name of Thomas Wilson, Salisbury-place, Edinburgh, to which he removed four years ago, having previously resided in Glasgow. His *incognito* was only known to one or two individuals in the neighbourhood, who kept the secret till after his death. The application for interment was made in the name of Thomas Wilson. There was a plate upon the coffin which he had got prepared some years before, but without any name upon it. It bore a Latin inscription, the sense of which was as follows:—"Here lie the remains of a great sinner, saved by grace, whose hope rests in the atoning sacrifice of the Lord Jesus Christ." The preparation of this inscription years before shows that he was deeply penitent. He was very anxious to conceal his true name, having got it carefully obliterated from his books and articles of furniture. He was buried at his own request in the most private manner at 7 in the morning.—The movement for the establishment of public baths for the working classes is going on prosperously. On Wednesday a meeting was held in the Music-hall for considering the subject, which was addressed by the Lord Provost, Lord Dunfermline, Dr. Alison, and other parties of influence. Lord Dunfermline pointed to his proposition of the working classes as clearly indicating a vast advance made by them, and as heralding still further improvement.—The Edinburgh papers have lately contained long accounts of a young lady who made her appearance at a lodging-house in Queensferry in male attire, and on being suspected stated that she was of Greek extraction; but that her father about three years ago, had come into possession of landed property in the south of Scotland, where they had lately been residing. She further stated that her friends had insisted upon her marrying an old gentleman of eighty, and that the ceremony had actually been performed that morning; but that she was so disgusted with the disparity of the match that she had seized an opportunity when left to herself, of disguising herself in the dress in which she had come to Queensferry, and effecting her elopement from her friends altogether. She refused, however, to give any names, or anything that might lead to the testing of the story. The police were ordered to watch her movements, and she removed to an hotel in this city. On Wednesday however she paid her bill and disappeared, and all trace of her has been lost. In the meantime, it is proved that one part of her story is untrue; for instead of coming from the south of Scotland, it is ascertained that she came to Edinburgh by the Berwick mail, from Darlington, and that the guard and coachman from Darlington to Berwick (who appear to have had their attention attracted to her by some eccentricities of manner) were of opinion that she had come from London to Darlington by railway on the night of Tuesday the 12th December. Her original residence is, therefore, shifted from the south of Scotland altogether; and may perhaps account for the circumstance that no inquiries have been made by any of her friends. It is the opinion of those who have seen her that the poor girl is insane.

Dumfries.—A meeting was held in the Council Chamber, Dumfries, on Wednesday, to form an association against the crows of Nithsdale. The attendance is said to have been great. Some farmers said it cost them 10*l.* yearly to herd their crops; others, that the crows did them 10*l.* of damage; others computed the damage at 10,000*l.* from crow depredations! A committee was appointed to wait upon the proprietors of rookeries, requesting them to check the increase of crows, and a subscription in aid of the object of the meeting was entered into.

Miscellaneous.

Plague of Locusts.—The following account appears in one of the Indian papers received by the overland mail:—"There has been a vast flight or flights of locusts, which have apparently laid waste a belt of country extending from the right bank of the Ganges across the Dooab, and penetrating over the Jumna into Gwalior. They committed dreadful ravages in the districts of Furukabad, Etawa on both banks of the Jumna, and at Dholpore in the Gwalior State; and it was feared later accounts would show much more damage to have been committed. The following are the particulars:—On the 16th of September about 5 P.M. they came over to Futtehghur, the principal city of the Furukabad district, and in an hour's time they had stripped every vestige of cultivation, *breaking down large branches of trees with their weight.* From Etawah a traveller going down the river Jumna writes on the 17th that the ravages committed have extended for miles. In passing over the boat, the noise is described as being like distant thunder. But a letter just received from Dhonore states that the flight passed over it on the 14th, that it came from the eastward, and after remaining twenty-eight hours took its departure in the same direction; so that there must have been more than one flight to have been simultaneously at Etawah and at Futteghur, distant nearly 100 miles. The destruction to the crops in that portion of the north-west provinces, through which in a month or two troops will be passing, is stated to be enormous. The revenue of course must be given up, and taken in connection with the state of affairs in the north-west, it must altogether be looked on as a most grievous calamity."

Stationery Provosts.—It is rather a curious coincidence that the Chief Magistrate of London, Edinburgh, Glasgow, and Perth, should at present all be members of the respectable fraternity of stationers.—*Caledonian Mercury.*

Strange Coincidences.—The *Courrier Français* states that some days since a statesman and academician, in the course of a conversation which took place in the library of the National Institute, observe that in the middle of each century for the last five hundred years some great social crisis had occurred in Europe. "In 1450," said he, "it was the art of printing which created a revolution. In 1550 it was Luther who shook the foundation of Catholicity. In 1650 it was Bacon and Descarts who demolished the infallibility of Aristotle. In 1750 it was philosophy which triumphed and prepared the revolution of 1789. We approach the year 1850, and it is evident society is preparing to undergo a fundamental renovation."

Classical Discoveries.—The *National* announces the return of M. Minoi de Minas from a scientific mission in Greece, Thessaly, and Constantinople, which lasted three years and was undertaken at the desire of the Minister of Public Instruction. Amongst the valuable manuscripts discovered and brought to France by M. Minas must be noticed Fables by Babryas, a fragment of the 20th book of Polybius, several extracts from Dexippus and Eusebius—two historians but little known to us, a fragment of the historian Pryseas, a treaty of the celebrated Gallo which was deficient in his collection, a new edition of Esop's Fables with a life of the fabulist, a Treatise on Greek Syntax by Gregory of Corinth, an unpublished Grammar of Theodosius of Alexandria, a history of the Conquest of China by the Tartars, and various other works, which have safely arrived at Paris.

Metallic Cement.—At the Society of Arts last week a paper was read by the Secretary on the new patent metallic cement, a composition of sand and of the refuse of copper commingled, and of a peculiarly hard and durable description. Specimens of its application to building purposes were exhibited, showing that it was susceptible of a fine marble polish, and of being made to imitate granite. It was stated by the chairman that this invention would find an abundant market in the mountains of Wales, where the refuse of copper was so great that the proprietors did not know what use to make of it. Fresco paintings worked upon the surface of this cement were likewise exhibited, the result of the method being that they may be preserved much longer by this process than by the usual method.

Law.

WINTER ASSIZES, OXFORD CIRCUIT, STAFFORD.—***Sarah Westwood*** was charged with having murdered her husband, John Westwood, by the administration of arsenic. It was proved that the prisoner had purchased the arsenic, and had administered gruel to her husband, in which some white powder had been mixed, and that he died soon afterwards. The surgeon stated that on a *post mortem* examination he analyzed the contents of

the stomach, and tested them with various tests. Every one clearly indicated arsenic. He could, independently, detect small grains of arsenic by the eye. With nitrate of silver he obtained the yellow precipitate. He used the black flux on charcoal, and reproduced metallic arsenic and all the other tests and re-agents. As he was going to Birmingham he took the stomach and contents to Messrs. Southall, analytical chemists there, and they perfectly satisfied themselves of the presence of a quantity of arsenic, of nearly half an ounce. The Jury found the prisoner Guilty, and she was sentenced to death.

Samuel Fellowes, Robert Purslow, John Perry, and *Daniel Webb* were charged with having murdered a girl, named Mary Lane Wild, by throwing her down a coal-pit near Wolverhampton. The girl had been brought up from the pit shortly after the violence had been committed, and before her death, which soon ensued, she identified the prisoners as the perpetrators of the outrage. The Jury returned a verdict of Acquittal on the capital charge. The prisoners were then indicted for the assault, convicted, and sentenced to 18 months' imprisonment, with hard labour.

Thomas Morgan and *Thomas Lewis* were indicted for having on the 7th Oct. last, with other persons, assembled at Dolauhirion-gate, in the parish of Llandingad, and destroyed the toll-house. After several witnesses had been examined, the case was suddenly brought to a close, the Judge being of opinion that the charge had not been supported, there being no evidence that the house had been pulled down by a "riotous and tumultuous" assemblage of people. The prisoners were consequently Acquitted.

John Jones, David Davies, William Walters, and *Thomas Morris,* were charged with a riot at Spudders Bridge on the 8th of Sept last, and with feloniously demolishing a toll-house. The Attorney General stated that, for the misdemeanor he should enter a *nol. prosequi* as to John Jones, David Davies, and William Walters. Thomas Morris the other prisoner, was then charged with the misdemeanor, and pleaded Guilty. The Attorney-General said, that from what he had heard, the prisoner was in part compelled to join in the riot, and he should be satisfied if he were to enter into his own recognizances to appear and receive the judgment of the Court whenever called upon, and be of good behaviour in the mean time. He was bound over in the sum of 50*l.* to appear, and was then discharged.

CHESTER CIRCUIT.—CHESTER.—(*The Mormonites or Latter Day Saints.*—*Jonathan Pegmon* a blacksmith, and *Thomas Cartwright* blacksmith, were indicted for the manslaughter of Sarah Cartwright the wife of the last-named prisoner, by drowning her in the brook at Monks Coppenhall, in this county. The Attorney-General for the Palatinate of Chester stated the case for the prosecution. The particulars were given in this Paper at the time; and it will be recollected that the prisoners, being Mormonites, were in the act of baptizing the deceased in the river by immersion, when they let her fall and she was drowned. The learned gentleman had just stated the case, and was as he supposed about to prove it, when it was discovered that neither the attorney nor the witnesses for the prosecution were present, although it was well known in Chester on the previous evening that this case would come on early in the morning. This discovery filled the judge and the entire court with surprise, such a thing having scarcely ever been known in a court of justice, especially when due notice had been given to the parties to attend. After waiting a long time to no effect the Judge directed that the prisoners should be arraigned upon the Coroner's inquisition, when no evidence being offered his Lordship, in directing an acquittal, observed that the Attorney-General had exercised a very proper discretion, for after the way in which the parties connected with the prosecution had acted, it would not be fair to try them again for the same offence. This was a failure of justice owing to the culpable neglect of the parties who ought to have attended on behalf of the prosecution. The Jury acquitted the prisoners. His Lordship then briefly addressed them, informing them that it had nothing to do with their religious tenets, but from the nature of the event which had happened, and the deep distress which one at least if not both must feel, he hoped they would exercise more caution in future. It was generally rumoured in the town that the witnesses in the case had purposely absented themselves, some of them being "Latter Day Saints."

The Burglary at High Legh.—*Thomas Riley, Richard Holbrooke,* and *Joseph Holbrooke,* were indicted for a burglary committed in the dwelling-house of Letitia Widders at High Legh on the night of the 14th October. The facts of the case, as proved by the evidence for the prosecution, were as follow:—Mrs. Widders is a farmer at High Legh, the only inmates of her house being herself and man-servant. They went to bed about 10 o'clock on the night in question, and in the course of about two hours were disturbed by a noise of persons breaking into the house. Mrs Widders immediately awoke her servant, who upon looking through a trap-door in the floor, saw four men in the buttery. The men had their face blackened and immediately upon seeing the servant near they pointed their pistols at him. One of the burglars called out to his comrades "Get your pistols ready." Upon hearing this Mrs Widers got her cash-box, and having placed it in a trunk pushed it under the bed. The box contained 42 sovs. and about 5*l.* in silver. She and her servant then ran down stairs to the front door and endeavoured to make their escape, but they found that the thieves had fastened the door on the outside. In the meantime the burglars forced open the pantry door, and rushing in upon Mrs. Widders and the servant presented their pistols at their breasts and asked whether they knew them. Upon Mrs. Widders saying that she did not the fellows demanded her money. She believed that she had any but the men replied that they knew her of old and they must have her money or they would blow her brains out. One of the men took up a sickle, which he placed in the fire, and having made it very hot flourished it over their heads, which so alarmed the servant that he said he had eight sovereigns which he would give them, and he went up stairs to the purpose of procuring the money when two of the burglars followed him, leaving the other two to guard Mrs. Widders. The men then came down stairs and broke open several drawers, and not finding any money they again threatened to take their lives and forced Mrs. Widders and her servant to accompany them up stairs. One of the burglars saw a box under the bed, and they immediately broke it open and ransacked it of its contents. One of them told Mrs. Widders and her servant that if they dared to make an alarm or go outside the door for two hours, they would leave two men at the door who would come in and blow their brains out, which injunction Mrs. Widders and the servant-man obeyed. At the expiration of the two hours the servant-man procured a messenger and sent information to the special high constable of the Bucklow Hundred, who immediately hastened to the spot and examined the premises. Mr. Irwin found that the front door had been tied by a strong piece of cord to a cart-tree, which was put across the door frame. The door of the adjoining house was tied in a similar way. He found that the burglars had effected an entrance at the back of the premises by taking out a leaden window-frame, and they had left behind them an iron chisel and a very formidable weapon like a hammer, of which he took possession. From certain circumstances Mr. Irwin was led to believe that some steam-loom weavers had committed the burglary, and he apprehended Richard and Jos. Holbrooke, and Ralph Kerfoot, and the latter making a confession to another officer, this led to the apprehension of Thomas Riley. The principal witness was Kerfoot the approver, whose testimony was corroborated in almost every particular by a number of other witnesses. Mr. Temple addressed the Jury on behalf of the prisoners, and Mr. Yardley addressed the Jury on behalf of Riley, commenting with much severity upon the conduct of Mr. Jones, the deputy constable of Warrington, who had placed two of the prisoners in the same cell, and had employed himself in listening to their conversation. The Jury returned a verdict of Guilty against all the prisoners. His Lordship in passing sentence, said there were other cases against the prisoners; and it was fortunate that in the present instance they had used no personal violence towards Mrs. Widders and her servant, for in all cases where gangs of burglars went to commit a robbery with their faces blackened, and used personal violence, he considered it his duty to pass the heaviest sentence of the law—transportation for life; in the present case he would not go to that extreme, but would sentence them to transportation for 18 years.

CENTRAL CRIMINAL COURT.—*Isabella Bryant,* who pleaded Guilty at the November Session to an indictment charging her with stealing some articles of dress and drapery belonging to the Trustees of the Infant Orphan Asylum at Wanstead, was brought up for judgment. It will be recollected that the prisoner was matron of the asylum and was on the occasion of her conviction strongly recommended to mercy. Mr. Commissioner Bullock addressed her, and sentenced her to six weeks' imprisonment in Newgate, to be computed from the date of her conviction. Her imprisonment consequently will expire on Monday next.

James Green, described as a labourer, but generally known as *Captain Hamilton,* was placed at the bar charged with unlawfully conspiring with other persons named Arthur Hodges and Charles Parker, not in custody, to represent himself with them as persons carrying on business as bankers and merchants in Austin-friars, and also pretending that he was a gentleman of property and respectability and worthy of credit, for the purpose of defrauding James Finden and several other persons, and fraudulently obtaining goods of the prosecutors by means of those false pretences. Mr. Price stated the case for the prosecution. He said that the mode adopted by the prisoner to obtain the goods of the various prosecutors was the same as that adopted by him in the first case, which would be presented to the notice of the jury, namely, that of Mr. Finden. In this case the prosecutor, who carries on business in High Holborn, had a cabriolet for sale, which he advertised. The prisoner called on him to purchase it, and having agreed upon the price, he referred him to Messrs. Hodges and Parker, whom he represented as bankers and merchants, in Austin-friars. The prosecutor called on Hodges and Parker, who gave such a character as was calculated to satisfy any one. Hodges and Parker had been in custody, but unfortunately the magistrates had liberated them on their recognizances, and they had not surrendered. One of them did appear in this Court last session, and was then let out again, having surrendered, and it now appeared he was not forthcoming. The offence was fully proved by numerous witnesses. The prisoner then addressed the Jury for his defence, and contended with considerable ingenuity that there was no proof whatever of conspiracy between him and the other persons mentioned. He then went into a history of the transactions between himself and Hodges and Parker. He said he had been engaged as a Parliamentary agent, and had his office in Essex-street. He had an account open with the Joint-stock Bank, and another with the bank of Messrs. Barnett, Hoare, and Co. in Lombard-street. He met Parker with whom he had been previously acquainted, and Parker told him he was in business with Hodges, and offered him such advantages that he was induced to remove his account from the other banks and open an account with them. He then proceeded to speak of the affairs of Parker and Hodges, by whose failure he said he had lost considerably. He said that Hodges had come in for a property of 6000*l.* since the failure, and arrangements were now in progress and partly completed for the paying off all the debts of the firm which scarcely amounted to 10,000*l.* As to himself he said he always intended to pay his debts, and would do so as soon as he was able. It was well known to all the world that he was the son of a banker in Yorkshire, and that he had married a lady who was an heiress, and brought him a very large fortune of 10,000*l.* He concluded by asserting his innocence of the fraudulent transaction. The Recorder summed up and the Jury found him Guilty. He was then sentenced to imprisonment in the county gaol for one year.

POLICE.—CLERKENWELL.—*Edward Armstrong,* who had been remanded last week on a charge of threatening to shoot the Queen, was brought up on Monday for final examination. It appeared that the prisoner had been apprenticed to a gardener, and had been in the employment of Lady Crofton, sister to the Duke of Richmond. Her Ladyship, he said, lived at "Mote Park," near Capeltown. Four years ago he left Lady Crofton's employment. When he came to England he was employed as gardener to the Duke of Richmond at Goodwood. He was in the Duke's employment a year and a half. He then went back to Capeltown, but returned to Liverpool, and got into the service of Mr. Woods, in whose employment he remained for two months. He was subsequently employed by two booksellers in Liverpool, and by a chymist. He had been taken to the Middlesex Hospital, where he was examined by the house surgeon, and other medical gentlemen, and they were of opinion that he was not insane, though they saw a vacancy about him. Mr. Wakefield surgeon to the House of Correction, said he had examined the prisoner and saw no ground whatever for thinking him insane. His answers to him were rational, and he believed him to be of sound mind. Dr. Taylor was of a similar opinion, having examined the prisoner carefully. A police constable stated that he accompanied the prisoner from the House of Correction to the Court. Among other things he said his friends were in America and that his object was to get there himself. Prisoner.—I deny that. Dr. Taylor had asked me about my companions at Liverpool, and if they were Irish. I should be sorry your Honour should think I have any dislike to the English people. I felt inclined to do something, and thought I would be driven to it by destitution. My head is affected and I have had fits. I felt I would not have proper control over myself.—Mr. Combe said he saw no reason whatever to think the prisoner was a person of unsound mind. He thought his real object was to get to America, and that he had trumped up this story for that purpose. He would hold the prisoner to bail in two sureties of 20*l.* each for one month, and in default thereof send him to the House of Correction. The requisite bail not being forthcoming, the prisoner, who evinced no surprise at the result, was sent to prison.

LAMBETH-STREET.—*Nehemiah Shakspeare,* a middle-aged man who had been upwards of seven years resident engineer at the Lambeth Waterworks and who while in that situation enjoyed a handsome salary, was charged by Mr. Johnston the principal in the firm of Johnston and Co., Gloucester-street, Commercial-road East, with having wilfully and maliciously caused the bursting of a steam-boiler on his premises on Tuesday morning last, by which the lives of 70 individuals were placed in the most imminent danger and property to a considerable amount destroyed. Mr. Johnston deposed that prisoner had been employed in setting up and preparing a steam-engine on the premises, which was completed about two months ago. When it was set up prisoner applied for the situation of engineer, and he at once engaged him at the wages of 28*s.* a week, to superintend and work the engine, and between three and four weeks he took charge of the engine and works. On Saturday last he spoke to the prisoner about a slide which he was preparing for the engine, and believing that he was longer in executing the job than was necessary, told him that if he did not wish to do it to say so at once and he would find somebody else to finish it. The prisoner made no particular observation at the time, but it was evident that his observations were anything but pleasing to him. They however had the effect of urging him on in the completion of the work, which he finished on the Monday. On Tuesday morning witness went into the engine-room, where the prisoner was at the time, and from what he had observed thought all things were right. The boiler of the engine was supplied from a well and the pump which supplied it was worked by the engine itself, so that with the most ordinary care there could not be any deficiency; and on the morning in question the prisoner himself acknowledged that the supply was not only regular but abundant. After leaving the engine-house he entered the warehouse immediately, adjoining it, and about ten minutes an immense volume of steam, soot, and other matter rushed through the door separating the warehouse from the engine-house and enveloped the place in perfect darkness. As soon as witness was able he groped his way to the door leading to the yard, and on getting out heard violent screams from a loft over the warehouse in which there were 50 boys employed. Some of the young men employed in the loft which was enveloped in darkness in the same way as the warehouse, had got out of the windows and let themselves drop down to the ground. As soon as all the persons on the premises, upwards of 70, were out, witness went to the engine room and found that the boiler, which weighed upwards of three tons and a half, had been blown completely from its setting to a distance of about thirty feet into the yard and rested on an elevation of six feet from the position from which it had been blown. In reply to questions from the magistrate, Mr. Johnston said that the loss sustained would amount to over 250*l.*; that his brother was injured on his head by the falling of a part of the engine-house, that two young men were also injured by falling from the windows, but neither of them very seriously. John Williams said he had been employed in assisting the prisoner in finishing the slide for the engine, and on Monday night he had occasion to get upon the top of the boiler, and finding that there was no water in it, he addressed the prisoner, saying "There's no water in the boiler," upon which he replied, "No, I should think not." On Tuesday morning witness was in the saw-house, when the prisoner came in there and went past him, and was returning when the explosion took place. At the time the prisoner exclaimed, "What's that!" and witness replied, "It's the boiler that's burst, and you must know it is." In reply to Mr. Johnston, witness said that on Monday the stoker tried the cocks in front of the boiler, and found there was no water on. The prisoner declared he could not account in any way for the accident, but was satisfied it was not for want of a good supply of water. He said that he was perfectly innocent of the charge, and that it was quite impossible he could have thought of anything so wicked, as he endangered his own life as much, if not more, than any other; and for his character's sake as an engineer, would not have wished the thing for 1,000*l.* Mr. Norton observed the case should undergo a much more minute investigation, and remanded the accused to a future day, consenting however in the meantime to take bail for his future appearance.

SPORTING.

TATTERSALL'S.—THURSDAY.—DERBY.—1000 to 40 agst Lord Maidstone's Cockamaroo (taken); 300 to 10 agst Colonel Peel's Ionian (taken); 1000 to 25 agst Mr. Bowes's Saddle-Bow (taken); 2250 to 50 agst Mr. Quin names Foig-a-ballah (taken); 400 to 10 agst Mr. Watt's Voltri (taken); 2000 to 30 agst Mr. Osborne's Mamsel Otz colt (taken).

GAZETTE OF THE WEEK.

BANKRUPTS.—J. WHEATLEY, Kennington-cross, Lambeth, livery stable-keeper—R. STEVENS, New Cut, Lambeth, dealer in China—H. F. TUBBS, Myddleton-street, Clerkenwell, painted baize manufacturer—D. NICHOLAS, Liverpool, hatter—W. WOOD and H. PORT, Burton-upon-Trent, Staffordshire, screw manufacturers—J. BAYLIS, Deritend, Warwickshire, victualler—R. SMITH, Tipton, Staffordshire, grocer—G. HOLLSWORTH, Northowram, Yorkshire, worsted spinner—W. FUTLER, coal merchant, Cotton-street, Poplar—J. M. E. STOKES, coal merchant, St. Alban's, Hertfordshire.—T. SANDAS shoemaker, Kent.—W. P. M. CROFT, victualler, Great Windmill-street

SCOTCH SEQUESTRATIONS.—R. EWING, Largs, Ayrshire, wright and joiner—T. FINLAYSON, Tain, malster and brewer—W. PATERSON and Co., Keir Bleachfield, Arbirlot, bleachers—W. D. LAPRAIK, Glasgow, wright and builder—R. and D. Ferguson, Dundee, sail-makers.

BIRTHS.—On the 29th ult., in Harley-street, the lady of Sir Denis Le Marchant, Bart., of a son—On the 17th ult., at Rome, the lady of A. Baines, Esq., jun., of a son—At Corfu, 25th Nov., the wife of Capt. Fitz-Herbert, of the Rifle Brigade, of a daughter—On the 3d inst., in Arlington-street, the Lady MARY STEPHENSON, of a son—On the 31st ult., the lady of J. YEARSLEY, Esq., Saville-row, of a son.

MARRIED.—On the 2d inst., at St. John's, Paddington, THOMAS EARDLEY WILMOT, eldest son of Sir T. W. BLOMFIELD, Bart., to GEORGIANA LOUISA, third daughter of Sir FREDERICK and Lady SARAH MAITLAND—At Axminster, on the 28th ult., the Rev. W. BRUCE, rector of St. Nicholas, third son of J. BRUCE PRYCE, Esq., of Duffryn, Glamorganshire, to MARY ELIZABETH, only daughter of the Rev. W. D. CONYBEARE, vicar of Axminster.

Lady KENSINGTON—On the 30th ult., at Lindfield, Sussex, after a life devoted to the best interests of mankind, W. ALLEN, F.R.S., in his 74th year—On the 30th ult., W. S. CLARKE, Esq., an East India Director, Esq. Bank, Leatherhead, in the 76th year of his age—On Thursday, the 28th ult., after giving birth to a son, the wife of Mr. EDWARD COOKE, and daughter of Mr. GEORGE LODDIGES, of Hackney.

WANTED, to take the Management of a Nursery in the Isle of Man, a steady, industrious Man, of business habits, who has served a regular apprenticeship, and has a thorough knowledge not only of the Forest-Tree and Greenhouse department, but a taste for and been accustomed to Ornamental and Landscape Gardening—forming out and planting New Plantations, &c. As there is a Seed-business connected with the concern, a person with a knowledge of that department will be preferred, as his services may be in part required at the Shop.—None need apply unless he can produce good and sufficient Testimonials of Character and Ability for the work. Apply to ALEXANDER SPITTALL, Whitehaven, Cumberland.

WANTED.—An Active Man, as Shopman, who perfectly understands the London Seed Trade; he will have to assist in the correspondence, and will not suit unless he has been in a London House. Unexceptionable references as to ability and integrity will be required.—Apply to Mr. J. G. WATTS, Seedsman, &c., 1 and 4, Eyre-street-hill, Hatton-Garden, London.

A VACANCY for a MEDICAL APPRENTICE exists at a Public Institution, in one of our largest commercial cities. The advantages afforded are—residence in the family of one of the Medical Officers, with liberty to attend the regular course of study preparatory to examination, and ample opportunities for practice.—Apply at the Office of this Paper.

WANT PLACES.—All Letters to be post-paid.

TO LANDED PROPRIETORS.—A young person of the highest respectability is desirous of obtaining a Situation as Agent to a Nobleman or Landed Proprietor. He has been four years with a gentleman who has extensive estates under his management, and is, therefore, well qualified to undertake the duties of such a situation. Apply to J. C. M., at the *Agricultural Gazette Office.*

AS GARDENER, where one or more men are kept.—A young Man, aged 35, who perfectly understands Forcing, Kitchen, Fruit, and Flower Gardening, and has a Practical knowledge of the cultivation of Plants; has no objection to take charge of land, and can have an unexceptionable character from the Gentleman he has lived with 4½ years.—Direct to W. Y., at Mr. PAMPLIN'S Nursery, Hornsey-road, Islington.

AS UNDER GARDENER.—Wanted by a young Man, 18 years of age, a Situation as Under Gardener in a respectable family. He can have a three years' character from his present employer.—Letters addressed to M. T., Post Office, Gainsborough, will have immediate attention.

AS BAILIFF.—A middle-aged married Man, without children, who is thoroughly acquainted with the Yorkshire system of farming, is desirous of an engagement to superintend or take the management of a farm. Satisfactory references can be given as to character, and his ability to manage either arable or pasture land, and the rearing and feeding of stock.—Address Mr. LAWRENCE STEPHENSON, 13, Mason-street, Hull.

SUPERB NEW DAHLIAS, to be sent out in May, 1844.—LADY GRAY (Harrison's), beautiful rosy lilac, cupped petals, full and rising centre, shows its blooms well above the foliage, good size, much larger and fuller than Miss Abbott, and fit for any stand. Gained the first prize at the York grand open show, Sept. 27th; also in the first stands of 12 at Bretton open show; also in the first stands of 6, 12, and 24, at the Bradford open show; and has been admired by all who have seen it. Height, 3 to 4 feet. Plants, 10s. 6d.

LORD HOWDEN (Harrison's), rosy bronze, beautifully shaded, size and shape of Le Grand Baudin; full and rising centre; shows its blooms well above the foliage. Gained the first-class prize at the Great North of England open Show; also gained the first prize in the shaded or edged class at Bradford open Show, Sept. 27th, as well as the premier prize; also in the first stands of 6, 12, and 24 at the same place, and was universally admired. Height, 4 to 5 feet. 10s. 6d.

J. HARRISON, in offering the above SEEDLING DAHLIAS, respectfully solicits early orders, as the stock is very limited.

York, Jan. 9, 1844.

DAHLIAS.

J. KEYNES, FLORIST, Salisbury.—"STANDARD OF PERFECTION," (Keynes,).—The finest self-coloured Dahlia in the world; gained the 1st class prizes at Stonehenge, Windsor, Kingston, Surrey Zoological Gardens, and Crown and Anchor, Stockwell; also the 1st prize specimens at Stonehenge Floricultural Society, Stockwell. "It is as round as any Dahlia in cultivation: as complete an unbroken circle as could be drawn with the compasses; and as globular in front as possible. It is symmetrical to a hair, and as double as a Ranunculus. It is so remarkable as to be instantly recognised among a thousand. Colour deep crimson. It is the flower of the season, and must be had."—*Gardeners' Gazette*, Oct. 14. "The best-grown flower we ever saw, without exception, every requisite to meet the taste of a connoisseur being complied with: good colour, a honeycomb, regularity of growth and disposition in the leaves, and above all, as complete a rotundity of shape as if it had been cast in a mould."—*Salisbury Herald*, Sept. 2nd, 1843. Plants in May, 1844, 10s. 6d. "Orange Superb," (Dodd's, first-rate show flower, 10s. 6d. "The specimen sent would grace any stand."—Glenny. "Emma Noke," (Dowding's, bluish white, extra fine, indispensable to a first-rate stand, 10s. 6d. Catalogues containing all the fine old varieties and new flowers for the season may be had on application.—Salisbury, Jan. 10, 1844.

A SUCCESSFUL METHOD OF GROWING THE LISIANTHUS RUSSELLIANUS.

JAMES CUTHILL has printed the whole account of his treatment of the above most splendid plant, which has often been exhibited at Chiswick, Regent-street, and the Royal South London Societies; his largest plant this year having 600 blossoms on it, and gained the Large Silver Medal at the Royal South London Exhibition. A packet of seed, with the printed directions, will be sent at the small price of 2s. 6d. Also, very healthy plants of the above, from 2s. and upwards. Also, CUTHILL's celebrated Early MELON; his Early improved Black Spine CUCUMBER, at 2s 6d each packet, or 6s. for the three packets.—Florist, Denmark-hill, Camberwell, London.

T. & C. LOCKHART & DUNCAN, SEEDSMEN AND FLORISTS, 156, Cheapside, London, have just published their List of Seeds and Ornamental Greenhouse and Hardy Plants, which they will forward, free by Post, on application. They have purchased some very superior Pink Seed of one of the first growers, which they are selling in packets at 2s. 6d. and 5s. each. As it rarely occurs that it is offered of such quality, and as the Stock is very limited, they respectfully request early orders. If sown in March, Pink Seed flowers the same season. Early Walcheren Broccoli Seed, 4s. per ounce, sent free by Post.

BUSHELL'S Light Seedling Dahlia "EMMA."—Ground roots of this Dahlia to be disposed of for 3l. per root, for cash. Colour, white, tipped with deep cherry, the petal-form and centre good; the largest, most constant and free in flowering of any Dahlia yet propagated, and has obtained several prizes. J. B. cut 48 blooms from 14 plants, which were exhibited at one of the Metropolitan Shows, the whole of which Mr. Neville pronounced fit to be placed in a stand of 12. "PET RIVAL."—Colour purple maroon, fine cupped petal, and free bloomer; ground roots, 2l.; pot do., 1l. J. B. warrants the above Dahlias to give satisfaction, or he will return the purchase-money.—12, Hall-place, Kennington-lane, Dec. 15.

FASTOLFF RASPBERRY.
YOUELL'S TOBOLSK RHUBARB.
TWO SEEDLING PICOTEES.
FINEST CARNATIONS AND PICOTEES.
ARAUCARIA IMBRICATA.

Now ready for sending out; for particulars of which see Advertisement of the 6th inst.

YOUELL & Co., Great Yarmouth Nursery, Jan. 11, 1844.

TO GENTLEMEN PLANTING.

J. AND J. FAIRBAIRN are induced from the uncertainty upon which they hold the Manor-street Nursery (situated contiguous to the Home Nursery, Clapham Rise, where attention will be given to all applications), to effect a Sale of the Stock at as early a period as possible, consequently beg to solicit the attention of Gentlemen and the trade to the large and remarkably healthy and well-grown stock, consisting of fine large Laurels, twice transplanted, of extra growth; Portugal Laurels, very handsome; Green Hollies, of various sizes; Evergreen Privets, fine Standard and Dwarf Roses in great variety, fine standard flowering Thorns, Almonds, Æsculus, Robinias, and other Ornamental Trees, and Evergreen and flowering Shrubs, with a large stock of fine standard and dwarf, trained and untrained Peaches, Nectarines, Apples, Pears, Plums, and Cherries, of the most approved kinds, and of growth rarely equalled; also, a large assortment of Forest Trees, consisting of Limes, Elms, Birch, Beech, Hornbeam, Spanish and Horse Chesnuts, Mountain Ash, Poplars, and Spruce, and Scotch Firs; also a large number of Gooseberries and Currants, of excellent growth, and of the best varieties in cultivation, to all of which J. & J. F. respectfully invite the inspection of Gentlemen and Nurserymen, flattering themselves that the general character of the Stock is such as to ensure unqualified satisfaction, and which they are disposed to offer at very moderate prices for cash.

J. & J. F. respectfully beg to call the attention of Gentlemen to their advertisement of Heaths, &c., which has lately appeared in the *Gardeners' Chronicle*. (Oct. 21 and 28.)

Nurseries, Clapham, near London, Jan. 5, 1844.

ROBERT COOPER begs to inform his Friends and the Public that he has published his CATALOGUE OF CHOICE FLOWER-SEEDS, &c. &c. for 1844, which he can with confidence recommend, most of them having been grown by himself at his Nursery. Catalogues forwarded by post, on application.—Sion Nursery, Croydon, 1st Jan., 1844.

DOUBLE ITALIAN TUBEROSE ROOTS.—The above have just been received from Italy in a sound and healthy condition, and are warranted DOUBLE, at A. COBBETT'S, late Mr. BARRONS', Italian Warehouse, 18, Pall Mall. Price 4s. per dozen. Also a choice collection of Orange and Lemon Plants, &c., varying from two to six feet high, with strong Grafts and Heads, from 8s. to 25s. each. Catalonian and Arabian Jasmines, &c. Lists with prices per Post, &c.

SPLENDID NEW DAHLIAS.

W. C. DRUMMOND begs leave to offer the two following Seedling Dahlias, raised in 1842 by T. M. Yeeles, Esq., Bathford, in dry roots, and which he can confidently recommend as being first-rate Show Flowers. Prince of Waterloo, (Drummond); bright shaded red, regularly cupped, fine centre, and great depth of petals; as to a proof of its quality a first prize at Chippenham, placed before Standard of Perfection (Keynes'); Lady Antrobus (Spary's); Lady St. Maur (Brown's); and first prize at Bath, the only two places ever showed at. Height 4 feet.—Per dry root, 3l.; Plants in May, 10s. 6d. each. Sir H. Pottinger (Drummond's); rich plum-colour, fine cupped petals, a good centre, and an excellent Show Flower. Height 4 feet.—Dry roots, 2l.; Plants in May, 10s. 6d.

W. C. D. will have no objection to make an exchange with anything new and good.—Weston-road Nursery, Bath, Jan. 13, 1844.

HOOSAINEE MELON SEED.

R. WHITE & Co. beg to inform their Friends and the Public, that their new Culinary and Flower-seeds are now ready for delivery, and include a few remaining packets of the above splendid variety of Melon, from the fruit exhibited by Mr. Fleming, at 5s. per packet. Also, true Walcheren Cauliflower Broccoli, at 3s. per oz. A new and very fine Vegetable Marrow, noticed by DR. LINDLEY as being superior to all others; together with every other truly desirable kind. Kitchen-garden Seeds in collections of all the best kinds, in sufficient quantity for a first-rate establishment, sent free to all parts, 3l. 3s. The same in smaller quantity, 2l. 2s. Complete collection suitable for smaller families, 1l. 1s. A fine Collection of Flower Seeds, comprising 60 distinct and choice kinds, 1l. 1s. Orders from unknown correspondents must contain remittance.

Poole Nursery, Jan. 13, 1844.

E. P. FRANCIS, NURSERYMAN, Hertford, begs leave to recommend to the Nobility, Gentry, and the trade in general, Snow's superb white winter BROCCOLI, in 2s. packets, containing half an ounce, which was advertised last season, and will be found to give general satisfaction this winter and the ensuing spring. Also, Snow's Hybrid Prolific Green-flesh MELON, of most excellent rich sweet flavour, warranted to produce two and three crops in a season, from the same plants; has taken six first prizes at the North Herts and South Beds Horticultural Exhibitions, weight from 2 to 3 lbs., sold in packets, 5s. each. Also, Snow's Superb Walcheren CAULIFLOWER, which is found to be late and hardy, never runs, and produces beautiful large compact white heads, and is very dwarf. Sold in Packets at 2s. each, containing half an ounce.

E. P. F. begs also to recommend a very superior kind of Grange's White BROCCOLI, which produces large compact heads in the months of January, February, and March. Sold in packets, 2s, containing half an ounce. The above, making four packets, if ordered together, may be had for 10s., at the Hertford Nurseries, or of Messrs. NOBLE, Seedsmen, 152, Fleet-street; Messrs. J. WRENCH & SON, London-Bridge, and Mr. FLANAGAN, opposite the Mansion House, London.

THE Advertisers have growing at their Nurseries, near Edinburgh, a fine Stock of Transplanted LARCH, from 1 foot to 4 feet high, which will be sold at very reasonable prices. Also, all other descriptions of Transplanted and Seedling FOREST TREES and SHRUBS. The articles will be delivered at London, Hull, and Newcastle, at very low rates of freight.—WRIGHT, SONS, and WRIGHT, Nurserymen, Edinburgh.

J. KERNAN has now received his entire Collection of New VEGETABLE and FLOWER-SEEDS, which includes every Novelty really desirous, recently introduced:—

With all the other new kinds.

Dulley's Early Scarlet Admirable Rhubarb; all the new Strawberry-Plants, true to their kinds.

Heartsease, Picotees, and Carnations, named; Rivers' New Edition of the Rose Amateurs' Guide, 6s.

Rivers' Catalogue of Fruits, with directions for Culture, by Root-pruning, 1s. 6d.

Paxton's Cottagers' Calendar, 3d., which Ladies and Gentlemen should present to Cottagers.

Seeds for Distribution to Cottagers at cost price.

Everything new in Flower-seeds, of which Catalogues will soon be ready.

4, Great Russell-street, Covent Garden.

EARLY PEAS, &c.—HENRY D. CORMACK, SEEDSMAN, &c., begs to inform the readers of the *Gardeners' Chronicle* that they can be supplied with the following Early and Prolific Varieties, viz.: Cormack's Prince Albert, British Queen, and Early Kent Peas; Taylor's Improved Windsor, and Johnson's Wonderful Bean; Manchester Red and Seymour's White Celery, Walker's Long and Hamilton's Cucumber, &c., with every other variety of Horticultural and Agricultural Seeds, at his Wholesale and Retail Seed-Warehouse, 106, Deansgate, Manchester.

SHILLING'S EARLY GROTTO PEA.

J. AND S. SHILLING have succeeded in raising the above PEA, the Early Frame Pea, impregnated with the Grotto or Oyster Marrow, which they, with confidence, recommend to the Public generally, being quite as early, and nearly double the size of any other Pea in cultivation. Quite hardy, will stand the winter well, and a good bearer; the pod large and long. They would particularly recommend it to the attention of Market Gardeners. Price 3s. per quart; 10s. per gallon; 17s. 6d. per peck; 30s. per half-bushel; 2l. 10s. per bushel. Agents:—Messrs. FIELD and CHILD, 119, Lower Thames-street, London; Messrs. W. and J. NOBLE, 152, Fleet street; Mr. KERNAN, 4, Great Russell-street, Covent Garden; Messrs. HURST and MCMULLEN, 61, Leadenhall-street; Messrs. GRAY, ADAMS, and HOGG, Kensington.—Northwarnborough Nursery, near Odiham, Hants, Jan. 5, 1844.

THE BRITISH QUEEN AND PRINCE ALBERT PEAS.

WM. JNO. CORMACK begs to call the attention of Noblemen, Gentlemen, and others, to the above two new Varieties, the merits of which are thus noticed in the *Gardeners' Chronicle*. "THE BRITISH QUEEN on light soils, is the best of all kinds, and will drive Knight's Tall Marrow out of the garden." "THE PRINCE ALBERT, which has been cultivated in the Garden of the Horticultural Society during the season, produced Peas fit for the table *ten days earlier* than any other variety sown at the same time." Both varieties may be had in packages at 3s. 6d. each, at W. J. C.'s wholesale Establishment, Newcross, or the Bedford Conservatory, Covent Garden.

THE WALCHEREN CAULIFLOWER.

MESSRS. MARNOCK AND MANLEY beg to offer the above valuable article, warranted genuine, at 4s. per ounce; sent by post or otherwise; with a Treatise on its management, so that it may be kept in succession, fit for Table, throughout the year. It produces beautiful, large, compact, Lily-white heads, of a most delicious flavour, perfectly hardy, requiring no hand-glasses; it not only produces a better quality, but a much larger quantity, on the same space of ground as the old kinds of Cauliflower. It will be quite indispensable both to large and small gardens, for no Gardener, after having once had it *true*, would wish to be without it. All kinds of Kitchen-Garden, Lawn Grass, choice Imported and other Flower-seeds, warranted to grow freely, and genuine.

N.B. Their Catalogues of Flower-seeds, comprising everything that is new and rare, are ready, and may be had on application.

Nursery, Hackney, Jan. 4, 1844.

MARTYNIA FRAGRANS.

W. E. RENDLE has been fortunate in saving a few pods of seed of this rare and beautifully-scented Annual, and is now prepared to send out packets, at 2s. 6d. each. Printed directions for sowing, &c. inclosed with each packet. A few can be spared to the Trade.

Union Road Nursery, Plymouth, January 2nd, 1844.

SHIRREFF'S TARE.—After having discovered and introduced the Hopetoun Oat and Hopetoun Wheat, which have become the standard grains in some of the best-cultivated districts in North Britain, the Subscriber, in calling attention to this Tare, trusts that it will be deemed superfluous to lengthen an Advertisement with testimonials in favour of the plant. From residing in East Lothian until the present year, no opportunity has been afforded him of testing by field-practice, if this Tare is fitted for winter cultivation; but after seven years' experience, he assures Agriculturists, that it is admirably adapted for spring sowing, and that it will be found a new and valuable addition to the products of the farm. This Tare has grains of a large size, and light green colour; the blossom is pure white; while in rapidity of growth, and in luxuriance and succulency of foliage, it is not surpassed by any variety of the species. This Tare can only be obtained of the Subscriber, and he offers it at 10s. a bushel, cash, delivered at Bristol or Gloucester. The seeds are now ready for delivery, and may be had of Messrs. Gibbs and Co.; and samples will be forwarded by post to intending purchasers.

PATRICK SHIRREFF.

Buckover, Thornbury, Gloucestershire, Jan. 11, 1844.

N.B.—Hopetoun Oats from seed direct from Scotland, at 25s. a quarter.

A SMALL QUANTITY OF CURIOUS MELON SEED, from the East, may be had in packets of 12 seeds, at 6s. each, by addressing, post-free, with remittance, or reference, to C. M., care of Mr. TAAFFE, stationer, Crawford-street, Portman-square.

GREAT FALL IN ONION SEED.

J. G. WAITE, SEED MERCHANT, 1 and 4, Eyre-street Hill, Hatton Garden, London, begs leave to inform the Trade that he has just received a further supply of the finest ONION SEED, in consequence of which addition to his former large stock, he is induced to offer the same at the following very reduced prices, viz.:—

	£ s.	
White Spanish Onion . .	16 16	per cwt.
Brown Port	14 0	,,
Deptford	14 14	,,
Brown Globe	15 0	,,
Blood Red	14 14	,,

And all other varieties at equally low prices.

J. G. W. has also a large collection of Agricultural, Horticultural and Floricultural Seeds, of superior quality, grown from genuine stocks, which he can sell equally cheap.

READING ONION SEED.—True Seed of this large, mild, white ONION, *of Reading Growth*, will produce a crop far preferable to any imported Onions. Retail price, 8s. per lb. A moderate reduction if taken in quantity.

J. SUTTON & SONS, in offering the above article respectfully recommend to the attention of Gentlemen and Gardeners their Advertisement of last week, the Collections there offered containing very superior sorts of new Garden Seeds at very moderate prices.

**** Parcels delivered free to any of the railway stations in London, or to any part of the Great Western Railway within 70 miles of London.—Reading Nursery, Berks, Jan. 12.

ARGUS LIFE ASSURANCE COMPANY, 39, Throgmorton-street, Bank.

Empowered by special Act of Parliament, 5 & 6 W. IV., c. 76.

Thomas Farncomb, Esq., Alderman, *Chairman*.
William Leaf, Esq., *Deputy Chairman*.

William Banbury, Esq.	Rupert Ingleby, Esq.
Edward Bates, Esq.	Thomas Kelly, Esq., Alderman.
Thomas Camplin, Esq.	Jeremiah Pilcher, Esq., Sheriff of London and Middlesex.
James Clift, Esq.	Lewis Pocock, Esq.
Rt. Hon. J. Humphery, M.P., Lord Mayor of London.	

Physician—Dr. Jeafferson, 2, Finsbury-square.
Surgeon—W. Coulson, Esq., 2, Frederick's-place, Old Jewry.
Consulting Actuary—Professor Hall, of King's College.

Advantages of the Argus Life Assurance Company.
Low Rates of Premiums.

In addition to the subscribed Capital of 300,000*l*., the Assured have the security of the Company's Income of nearly 60,000*l*. per annum, yearly increasing, and accumulating Assurance Fund invested in Government and other available Securities, of considerably larger amount than the estimated liabilities of the Company. The Rates of Premium are reduced to the lowest scale compatible with the safety of the Assured and the stability of the Company, thereby, in effect, giving to every Policy-holder an immediate and certain bonus without risk, in lieu of the deferred and frequently delusive prospect of a periodical division of profits.

Annual Premium to Assure £100.

Age.	For One Year.	For Seven Years.	Whole Term.
20	£0 17 8	£0 16 1	£1 11 10
30	1 1 6	1 2 7	2 0 7
40	1 5 0	1 6 9	2 14 10
50	1 14 1	1 19 10	4 0 11
60	3 2 4	3 17 0	6 0 10

One-third of whole-term Premiums may remain unpaid at 5 per cent. comp. int. as a debt upon the Policy for life, or may be paid off at any time without notice.

In Assurances for advances of money as security for debts, or as a provision for a family, when the least present outlay is desirable, the varied and comprehensive Tables of the Argus office will be found to be particularly favourable to the Assured.

A Board of Directors, with the Medical Officers, attend daily, at a quarter before 2 o'clock,

EDWARD BATES, Resident Director.

A Liberal Commission to Solicitors and Agents.

AUSTRALASIAN COLONIAL and GENERAL LIFE ASSURANCE and ANNUITY COMPANY, 126, Bishopsgate-street, Corner of Cornhill.

Capital £200,000, in 2000 Shares.

DIRECTORS.

E. Barnard, Esq., F.R.S.	Gideon Colquhoun, Esq.
Robert Brooks, Esq.	C. E. Mangles, Esq.
Henry Buckle, Esq.	Richard Onslow, Esq.
John Henry Capper, Esq.	William Walker, Esq.

BANKERS.—Union Bank of London.

COLONIAL BANKERS.—The Bank of Australasia (incorporated by Royal Charter, 1835), No. 2, Moorgate-street.

PHYSICIAN.—Patrick Fraser, Esq., M.D., No. 62, Guildford-st.

SECRETARY.—Edward Ryley, Esq.

ASSURANCES may be effected with this Company at unusually favourable rates, affording every variety of accommodation to the Assured. Participation in Profits, ascending and descending scales of premium, permission to retain one-third of the premium, which is charged as a debt against the policy, tables for the assurance of a sum payable in the event of death to the executors of the Assured, or to himself upon the attainment of the ages of 45, 50, or 60.

To EMIGRANTS to the AUSTRALASIAN COLONIES assured for the whole life, this Company offers the advantages of permission to proceed to, to reside in, and to return from those colonies without extra premium, and to pay their premiums there.

All questions relating to Assurance and Annuities, addressed to the Secretary, will receive immediate attention.

RENDLE'S TANK SYSTEM OF HEATING.

STEPHENSON AND CO., 61, Gracechurch-street, London, Inventors of the IMPROVED CONICAL and DOUBLE CYLINDRICAL BOILERS, having been much engaged in heating buildings upon the above system with Tanks of various materials, solicit the attention of scientific Horticulturists to an Iron Tank now fitting up on their premises, which offers most decided advantages over every other article hitherto employed for the same purpose. These tanks which are ornamental in appearance can be made from 10 to 100 feet long and of any width and depth, and can be connected or disconnected by any working Gardener without the slightest difficulty, thus affording the opportunity to persons in remote districts of employing this much approved method of heating without the assistance of Engineers. The Tanks can be applied to Boilers and Pipes already fixed, and from the present low price of Iron will be found cheaper than those of any other material. MR. RENDLE, of Plymouth, has kindly undertaken to receive orders and furnish information to any persons in his neighbourhood, and prices for any size will be forwarded upon application to S. and Co.

J. WEEKS & Co., ARCHITECTS, HORTICULTURAL BUILDERS, and HOT-WATER APPARATUS MANUFACTURERS, Gloucester place, King's-road, Chelsea.

HOT-WATER APPARATUS FOR HEATING HORTICULTURAL BUILDINGS, DWELLING-HOUSES, CHURCHES, and MANUFACTORIES, upon improved principles, and at very moderate charges, erected by DANIEL and EDWARD BAILEY, 272, HOLBORN.

D. and E. BAILEY having devoted much time to the consideration of this subject, and had much experience in the erection of apparatus for the above-mentioned purposes, have, by improvements suggested in their practice, rendered their mode of heating not only very efficient, but very simple, and have combined durability in the apparatus with economy in the charge. They have erected apparatus in England, Scotland, and Ireland, for many noblemen and gentlemen, and have had the honour to be employed by the Horticultural Society of London, in executing the works of their splendid Conservatory, lately erected at Chiswick.

D. and E. BAILEY also construct in metal all descriptions of Horticultural Buildings and Sashes, and invite noblemen, gentlemen, and the public to an inspection of their various drawings and models, at 272, Holborn, where they have the opportunity of exhibiting, amongst other metal works, an extremely complete and convenient kitchen apparatus, or range, adapted for the continued supply of hot water, and an arrangement of the oven more complete than has hitherto been brought before the public.

D. and E. BAILEY were the first to introduce metallic curvili near houses to horticulturists, and can refer to the Conservatory attached to the Pantheon as one of their works, besides many others in this country and on the Continent.

D. and E. BAILEY have prepared a quantity of the Galvanic Plant Protectors, which are now ready for immediate delivery; they beg to introduce to public notice a new Trough Pipe, for Orchidaceous or other Houses where vapour is constantly, or at intervals required, and which may be seen at their Manufactory.

HOTHOUSES, CONSERVATORIES, &c., made and fixed Complete in all parts of the Kingdom. One, two, and three-light Cucumber and Melon-Boxes and Lights of all sizes kept ready for immediate use, packed and sent to all parts of the Kingdom; warranted best material. Two-light Boxes and Lights complete, from 1*l*. 8*s*. Garden-Lights made and glazed from 1*s*. per foot, at JAS. WATTS' Sash Manufactory, Claremont-place, Old Kent-road. **** Reference given.

Nos. I. to XIII., (price One Shilling each); to be completed in Twenty Monthly Numbers,

THE LIFE AND ADVENTURES OF MARTIN CHUZZLEWIT.

By CHARLES DICKENS. With Illustrations by H. K. BROWNE.

CHAPMAN & HALL, 186, Strand.

DEDICATED TO THE QUEEN.

Now ready, to be continued on the 1st and 15th of every month, Part I. (with Five Plates) of

THE PEOPLE'S GALLERY OF ENGRAVINGS.

To contain four beautiful Plates on Steel, quarto size, for One Shilling, executed by the first-rate Engravers from Originals by Sir Thos. Lawrence, Turner, Stanfield, Prout, D. Roberts, Allom, Chalon, Hayter, Parris, Maclise, Stephanoff, Cattermole, Bartlett, Leitch, &c. Edited by the Rev. G. N. WRIGHT, M.A. With Selections from the Writings of L.E.L., Mrs. Ellis, Mary Howitt, Agnes Strickland, Bernard Barton, &c.

FISHER, SON, & Co., Newgate-street, London.

HODGSON'S BRITISH and FOREIGN LIBRARY.

No. 9, Great Marylebone-street.

Subscribers, whether resident in town or country, receive the immediate perusal of all the new works, with which this Library is very extensively supplied, and particular attention strictly devoted to the fulfilment of their wishes, on the following terms:—

The Year . . .	£5	5	0	. .	£7	7	0	. .	£10	10	0
Half Year . . .	3	3	0	. .	4	4	0	. .	6	6	0
Quarter . . .	1	16	0	. .	2	12	6	. .	3	13	6

A SPACIOUS READING-ROOM,

possessing superior advantages to clubs and public institutions. Terms for the Year, 3*l*. 3*s*.; Half-year, 2*l*. 2*s*.; Quarter, 1*l*. 8*s*.

AGRICULTURE AND GARDENING.

Orders for Standard and Periodical Works, upon the above important subjects, whether English or Foreign, promptly executed and forwarded to all parts of the United Kingdom, *carriage paid*, on amounts of Two Guineas and upwards.

THE CHURCH (SIXPENNY) MAGAZINE; a Monthly Remembrancer and Advocate for British Churchmen. The principles of the present Conductors are specified in the pages of now nearly two years. We belong to no party but the Church, and to no party in the Church; having no sympathy with those who would either unprotestantise or puritanise it. Attached to the Prayer-book, Articles, and Homilies in their literal and obvious teaching, we believe our Church to be Scripturally Evangelical, faithfully Protestant, and happily Reformed, and so primitively Catholic in its constitution, doctrine, and worship, as now established. Such are the Evangelical High-Church principles of our little Family Magazine.

Published by G. BELL, 186, Fleet-street; and may be procured through any Bookseller.

On January the 8th, 1844, will be published, handsomely printed in Demy 8vo., Part the First, Price 12s.,

SPECIES FILICUM; OR A SYNOPSIS OF ALL KNOWN FERNS. This first part contains GLEICHENIACEÆ, POLYPODIACEÆ in part, and PLATES I. to XX. By Sir WILLIAM JACKSON HOOKER, K.H., L.L.D., F.R.S., &c., &c., Vice President of the Linnean Society, and Director of the Royal Botanic Garden at Kew.

**** It is intended to publish Part the Second on the 1st March, 1844.

London: WILLIAM PAMPLIN, 45, Frith-street, Soho-square.

BYRON COMPLETE FOR FIFTEEN SHILLINGS!

A New and Cheaper Edition of

LORD BYRON'S POETICAL WORKS. With Portrait, and View of Newstead. One volume, royal 8vo., 15s.

JOHN MURRAY, Albemarle Street.

THE SECOND REPORT of the "NORTH-NORTHUMBERLAND COTTAGE IMPROVEMENT SOCIETY;" with Lithographic Drawings; price 2s.

Messrs. WHITTAKER and Co., London; and M. SMITH, Alnwick, where the First Report, containing 7 Lithographic Drawings, may also be had, at the same price.

NIMROD'S LAST WORK.—Profusely illustrated, price 12s.,

THE HORSE AND THE HOUND; their various Uses and Treatment; with Chapters on Horsemanship and Horse-dealing. By NIMROD.

A. & C. BLACK, Edinburgh; SIMPKIN, MARSHALL, & Co., WHITTAKER & Co., and HAMILTON, ADAMS, & Co., London.

Just published, 8vo, cloth, 6s.,

ON THE NATURE and TREATMENT of TIC DOULOUREUX, SCIATICA, and other NEURALGIC DISORDERS. By HENRY HUNT, M.D., Member of the Royal College of Physicians, London; Physician to the Royal Metropolitan Hospital for Children, &c. &c.

London: JOHN CHURCHILL, Princes-street, Soho.

This day is published, price 7s. 6d.,

A PORTRAIT of PROFESSOR LIEBIG, of Giessen. A line engraving by RAUCH, after a drawing by TRAUTSCHOLD. Lately published,

LIEBIG'S CHEMICAL LETTERS. 2d Edit. Fcap., 8vo, 4s. 6d.

LIEBIG'S AGRICULTURAL CHEMISTRY. 3d Edit. 8vo, 10s. 6d

LIEBIG'S ANIMAL CHEMISTRY. 2d Edit. 8vo. 9s. 6d.

" "	Linnean	. .	8 P.M.
Wednesday, Jan. 17	Society of Arts	. .	8 P.M.
" "	Microscopical	. .	8 P.M.
Wednesday, Jan. 24	Entomological	. .	8 P.M.

We have already expressed our intention to devote, during the present year, a few articles to the consideration of economical and efficient heating as applied to conservatories, with a view especially to the improvements which have been introduced in the course of the last three or four years. That period has been unusually fertile in projects—some good, and some indifferent, connected with every branch of the subject; with the production, as well as with the application, of heat; with the chemistry no less than the mechanics. We shall therefore commence our inquiries with the first of these, as being the first in order, and as being scarcely less interesting to the possessor of a conservatory than to the proprietor of a steam-engine. The waste of mere money by bad combustion may, it is true, be of less consequence to the former than to the latter; but the nuisance arising from smoke and deleterious vapours, considered as a matter of taste and comfort, is not less objectionable in an ornamental garden than in a manufacturing town.

With reference, then, to the economical production of heat, or in other words, to the construction of a furnace which shall effectually consume all the consumable constituents of the fuel, the public have, it is to be feared, been repeatedly misled; 1st, by promises of performing something which is perhaps impossible; and 2dly, by experiments made under circumstances of care and vigilance, which are inconsistent with the ordinary and indispensable routine of actual business. While, therefore, some chimerical perfection has been toiled after in vain, the parties most interested have become dispirited by repeated ill success, and have been deterred from attempting to secure the moderate degrees of amelioration which we believe to be practicable and easily obtainable. The often-promised excellence has so often failed to be forthcoming, that the most imperfect and wasteful contrivances have been submitted to in despair.

It has been assumed by one very large class of the furnace-improvers, that the cardinal defect of all the old arrangements consists in the failure to supply at the right time and in the right place a sufficient, yet not more than sufficient, quantity of air. By another and almost equally large class, it has been taken for granted that the mischief has arisen from the circumstance that the cold fuel, being usually placed above the hotter portions, the early products of the distillation of the coal issue from a comparatively cold stratum, and therefore escape unburnt for want of sufficient heat to inflame them.

The fact is, most probably, that there is some truth in both these statements; but not so much in either as their advocates contend for. And both of them are doubtless wrong in taking it for proved that all the gaseous products of the coal, as liberated by ordinary distillation, are combustible when duly supplied with the respective specifics of the candidates—namely, air on the one hand, and heat upon the other.

That this is not the case, we think must be obvious to all who have amused themselves (and who in this country has not?) by watching the play of the gases as they escape from the coal in a common fire. Occasionally a jet will be observed issuing from a fissure in a half-ignited nodule (we presume this word to be the foundation of the parlour phrase, "nice *nobbly* coals"). Such a jet will be projected out in front of the fire; therefore, into a pure atmosphere, and within the region of highly-elevated temperature. It nevertheless continues in the state of white smoke, and will resist all endeavours made to inflame it by the application of a lighted match. At length, however, it will suddenly take fire, without any change in the circumstances of air or heat; but solely, as is evident, because the products of the distillation have gradually changed: the emitted gas has been altered in its chemical character, and has become susceptible of that inflammation which it previously refused. This is a point which, it appears to us, the furnace-physicians have not sufficiently noted: and it leads us to doubt of that perfect combustion which has been aimed at and rather rashly undertaken. Here, at least, seems to be a case where neither heat nor air could produce inflammation in a distinctly-visible gaseous matter, and to which none of the prevalent schemes apply any remedy—of which, indeed, they take no notice.

Nevertheless, we have every reason to believe that there is in every furnace, at some period of its operation, an inadequate supply of air, or of temperature, and sometimes of both. The advocates of fresh air laugh at those who demand additional heat, and ask whether they are aware that heat, although it will burn their fingers, will not burn smoke, or anything else—using the word *burning* in the sense of *consuming*, by new chemical combinations. These parties, however, laugh rather too soon, and not, we suspect, with quite sufficient reason, as the following common fact will show:—when coals are heaped in excess on an ordinary fire, a dense mass of smoke rises from the upper surface, which, like the jet before alluded to, will for some time resist inflammation, whatever heat be applied to it. After a certain period, however, it becomes inflammable, yet fails to inflame, because no sufficient heat finds a road to it from the overloaded fire. If in this state a lighted paper be thrown on the top of the coals, the whole surface becomes a blaze, showing clearly that the gaseous matters were previously escaping unburnt for want of heat alone.

On the other hand, it must be admitted that this is not the only defect; the imperfect combustion does, in many cases, arise from the inadequate supply of air, and occasionally from an improper mode of supply, even when the quantity is abundant: sometimes, perhaps, even from an excess of air; but these are intricate questions, which we must postpone to another paper.—*A.*

It must not be supposed, from the statement last week quoted from Mr. Barnes's Treatise on Pine-growing, that he starves his plants with poor hungry soil; that, indeed, would be a strange way of obtaining results like his. On the contrary, he uses manure, and a good deal of it. His charcoal is a sort of manure, and moreover he employs liquid manure, in the form it always should have; not the filthy mud with which some gardens are rendered offensive both to the eye and other senses, but the clear bright essence of the material. "Of course," Mr. Barnes says, "I do not supply it so strong to small weak plants as I do to strong large ones, and I always give it in a clear state, never by any means when thick and muddy, but clear and pure, as I would like a cup of coffee or a glass of ale. Is it not absurd to take pains to get the earth pure, and to admit pure air, and then to apply impure muddy water, thus stopping the pores of the earth? and there too where a mole, mouse, worm, or other insect, is sought for, and expelled as an enemy, instead of being encouraged as a friend. Practice has taught me that thick impure water, supplied largely to any plant under artificial treatment, proves often very injurious out of doors; where the worm is not destroyed it acts differently; at the same time, my choice is always to apply it both in doors and out in a clear state, as I am well convinced of its superiority." Upon this matter we may possibly have something to say another day.

Then, with regard to *bottom-heat;* can anything possibly be so absurd as to run the common risk of burning off the roots of the plants by a too high terrestrial temperature? To be sure, this may seem of little consequence to those who cut off the roots if they are not killed in some other way; but Mr. Barnes knows better. He is aware of the great importance of preserving the roots, and accordingly his directions about bottom-heat are worthy of being inscribed in letters of gold.

"You may have the best of soil and water, but without bottom-heat is very particularly and punctually attended to, great disappointments will ensue: *there is more injury done by bottom-heat than by all the other causes put together;* and, to my thinking, this was, in the first instance the means of giving them the character of being annually-rooted plants. Of one thing I am certain, that by misapplication it has often been the means of depriving them of their roots, not only annually, but almost every time their fermenting bed got renewed; which sudden checks are the principal cause of their producing such abundance of rubbish of suckers, and diminutive bits of fruit. *To prevent those unnatural checks* and disappointments my method is, to plunge the pot they are growing in not more than two-thirds of its depth, with an inverted pot for each plant to stand on (any ill-shaped old pots, or such as have a piece broken out of the side, or are cracked, &c., are always put by for this purpose), the fermenting material being always kept tolerably loose about them. Should I think the bottom likely to heat strongly, I merely give the pots a move back and front with a strong stake, which causes them to stand clear, with a cavity all round, to allow the heat and air to circulate freely; and when settled I loosen the whole bed up between the pots with a small hand-fork, and strong pointed stake, for the same purpose, just as I hoe and fork amongst crops in the Kitchen-garden. I have observed people plunge their Pine-plants down into a strong bottom-heat, and fancying, perhaps, after a time, that they were too hot, set to work and move them: and others I have observed pour a quantity of water round them; *my maxim is, prevent those occurrences;* for it generally proves like the old proverb of locking the stable after the horse has been stolen. Of what utility can a good preparation of pure soil and water be, if it is to be soured and spoilt by an unnatural bottom-heat? My own practice is *never to allow more than from* 70 *to* 80° *near the pot containing the roots.*"

Keep your plants constantly and steadily growing. No disrootings; no starving to-day and cramming to-morrow; no doing good by fits and starts; but a constant, steady, uninterrupted quick growth,—that is what the Pine wants. Mr. Barnes shifts from 24s to 8s and then to 2s.

"Sudden checks, such as burning the roots, overwatering, extensive fluctuations in top-heat, &c., are the means of causing numberless rubbishly suckers to be thrown up, more particularly from old stunted plants, which is a very great disadvantage to the swelling and flavour of the fruit if they are allowed to stay on the plant; and if they are not taken off with great care, there will be so many wounds left on the stem of the plant, that the sap which should assist in swelling the fruit, oozes from the stem in the shape of gum, and the remedy becomes as bad as the evil."

And now, after these and other excellent remarks, full of practical value in other things beside Pine-growing, we trust that we shall have no more idle cavilling about want of means and want of space and want of time, and all sorts of other wants, as impediments to growing Queen Pines to the weight of 6 lbs. avoirdupois. We shall set down all such pretences as only a new phraseology for want of skill. For what does Mr. Barnes use which all Pine-growers do not possess? The poorest soil, manure-water, large pots, charcoal, care, skill, and attention. But enough for to-day. We shall take an early opportunity of returning to the subject, which is a long way from being exhausted.*

A correspondent is shocked at a paragraph in a Leading Article of last week, on the subject of Ward's Cases, as he well may be. He cannot be so much shocked as we are. Speaking of dew formed on the inside of the glasses in these contrivances, there is the following paragraph:—"As to the deposit of dew upon the glasses, we may observe that since this is owing to the *in*side of the case being colder than the air that *surrounds* it, the only course to take is either to warm the *in*ternal air by some means, or to open a door in the case for a short time."

How a statement so entirely at variance with fact could have escaped observation can only be understood by those who are aware of the errors that arise from illegible writing, and of the confusion that is inseparably connected with the publication of the first Number of a new Newspaper. We hope no one will imagine that the sentence was written as it has been printed. What the author of the paragraph actually wrote was no doubt this:—"As to the deposit of dew upon the glasses we may observe that since this is owing to the *out*side of the case being colder than the air that *it surrounds*, the only course to take is either to warm the *ex*ternal air by some means, or to open a door in the case for a short time."

Fortunately, this misprint is not likely to have misled any one, because all gardeners know how the facts stand, by their experience with frames and greenhouses, even if they should not be acquainted with the A B C of Natural Philosophy. We hardly need add that the object of opening a door in a Ward's case is to equalize the temperature of the inside and outside, the result of which is the non-formation of dew.

THE SEEDS OF GARDENING.—No. II.

(*Continued from page* 4.)

The flinty coating of many foreign Legumes will preserve the living germ for an indefinite period, and withstand scalding water, and even several rounds of the grindstone, to reduce the envelopes sufficiently to admit the air and water necessary to germinate the infant plant.

* We had written thus far, when we received a letter, reproaching us for not having reprinted the whole of Mr. Barnes's article, as it appeared in the "Gardeners' Magazine" of Jan. 1; and pointing to another Gardening newspaper as authority for doing so. Our answer is very brief. The "Gardeners' Magazine" and the papers in it are the property of Mrs. Loudon: to transfer that property to our own columns is to dip our hand into our neighbour's pocket and empty its contents into our own—a convenient mode of getting rich, but not a very honest one. We are not plunderers of the widow and orphan; and we are sure that our correspondent will see, upon reflection, that his first view of this matter was a mistaken one, and that the obligations we owe to

I mention this to show that Nature has herself hinted to us the necessity of encasing the seeds that we would preserve.

The seeds of Coniferæ, encased in their resinous integuments, are beautiful illustrations of seed keeping, sound seeds being found in cones attached to the spray on which they grew, three or four years after the blossom that produced them had been dead. The seed-pods of the common Gorse and the Rhododendron are frequently sealed up from the foul weather of winter, and only open to scatter their seeds to the spring sunbeam; the Gorse and Rhododendron are therefore notorious examples of neglected plants, for though some may object to the Yew-tree as being an in-dweller with the grave, and perhaps not free from poison if eaten to excess by men or domestic animals, yet no such excuse can be urged against the Rhododendron, still less against the Gorse, for it is by far the best cover for game of any British plant we possess, and yields a canopy of green and gold to the landscape, food and shelter to the wild fowl, and forage for cattle; and surely the Rhododendron might stand in all its loveliness. Wherever the wild Heath grows, there, be assured, the soil is suitable, for all Ericaceæ may follow where Calluna has been, as far as soil is concerned; and as a moderate-sized bush of Rhododendron produces at least 1000 perfect seeds annually, wonder not if fair and friendly hands go forth to sow; and thus British moorlands, proverbially brown, may yet, ere an age expire, put on a rosy hue. Nature has taught Rhododendrons to open their blossoms in early summer, to ensure impregnation, and perfect seed, and again to burst their seed-pods in early spring, to secure a favourable seed time; therefore, if they are once put in possession of our heaths and moorlands, their posterity will be provided for, and Britain's hills adorned; for they will soon propagate themselves by myriads on every moss and moor. They do so here, and at Chatsworth in situations high and bleak, hitherto considered unfavourable to American plants, thereby proving practically the working of the plan I propose—of inoculating, as it were, by patches, the mountain's brow and wide extending moor with seeds of native and exotic evergreens, and thus bringing them piecemeal into ornamental and valuable cultivation, for I am tired of seeing square miles of "the land we live in" yielding only besom-timber.

But I hasten to the main subject, namely, the saving, preserving, and distributing of seeds with some fixed system, and according to some general plan. In the saving of seeds, I would not have gardeners to be seedsmen; yet, to a certain limited extent, is this branch forced upon us, meet it how we may. A drying-room, hot room, or something very nearly resembling a slow Corn-kiln, is essentially necessary in every garden, not only for seeds, but also for all other articles requiring drought, or liable to injury from damp, such as the nets and bunting for wall-trees, and the like; garden-mats, glazed lights, in wet weather, or when washed previous to painting; and last, though not the least necessary, the proper drying of pot-herbs—a process seldom, if ever, properly done. To prove this, it is only necessary to examine English-dried Basil, Mint, Marjoram, or the like, in bundles, leaves, and stems, or perhaps with the leaves wanting, exhibiting only a bundle of dry or mouldy stalks, dusty or damp, as the apartment chanced to be where they were stowed. Compare these, I pray you, with Chinese dried herbs! And be it known, that English herbs will dry as neatly as Chinese tea in a hot room, such as is used here and in many other places for the seasoning of green timber. Camomile flowers and the leaves of pot-herbs may in this manner be dried of a fine green colour in 48 hours; and, if canistered immediately, will keep fresh and fragrant for years. The sun is highly injurious to the drying of herbs, as it bleaches them; and as for using canisters to keep herb-leaves in, I will produce precedents by thousands, for all wise matrons must agree that canisters must be had to preserve the flavour of fine tea, and so of other leaves and flowers; in short the saving of seeds in such a manner as shall preserve in the highest degree their vital energies, requires, in our humid clime, the aid of artificial drought, and when they are dried and dressed bright and clean they must be encased in something impermeable to moisture, in a word they must be kiln-dried to ripen them off, and canistered to keep them. Scarcely any article that we possess, unless it be as obdurate as the nether-millstone, can for any length of time remain unchanged in its nature and consistency, if exposed to the jarring elements that agitate our ever-varying atmosphere: hence the imperative necessity of having seeds, and indeed everything else, isolated from the air itself, as well as the other elements, if we wish to preserve them *in statu quo*, and I have not the least doubt that if seeds were soldered air-tight in cases, after being perfectly ripe and hard dry, and excluded from the ordinary changes on the earth's surface, by being entombed deep in its bowels, they would rise and resume the place and the line of their ancestors if carefully sowed in season time, though they may have reposed a century under ground; for one grand cause of seeds not keeping is their imperfections and encumbrances. Take a powerful microscope and examine seeds six months after harvest, and you will find their coatings clammy from original or occasional damp, and eggs of devouring insects sticking to their husk, ready to begin as soon as it is warm enough to devour the core of the seed on which they have fixed their dwelling. —*A. Forsyth, Alton Towers.*

(To be continued.)

TANK HEATING.

THE subjoined is a plan of a Pine-pit recently erected at Trentham, in which the tank system of bottom-heating and that of hot-water pipes for top-heat are combined; and for keeping a sufficient and steady heat, with a small consumption of fuel, nothing can be more satisfactory. The pit is 77 feet long, and 12 feet wide inside, and is heated by what is called a saddle-boiler. Under the bed are four tanks, *a a a a*, into which the water is delivered from the boiler, by a four-inch pipe at *b b*, and after pursuing the course indicated by the arrows is again received by another pipe, the end of which is shown at *c*. The advantage of two deliveries is that the water, not having so far to go, does not get so cold before it is returned to the boiler, and the heat is more regular in all parts of the house. The depth of water in the tanks is about 3 inches. The tanks are made of brickwork, coated with Roman cement. They are arched over with brickwork also, which we find cheaper than covering them with slates, and by leaving interstices between the bricks of which the arch is composed, the steam is allowed to escape, and penetrating the stratum of rubble above, to keep the tan in a proper state of moisture. The same boiler also supplies a range of four-inch pipe, which goes round the pit, as shown at *e* in the section. There are cavities in the wall, to permit the steam from below to pass to the top of the pit. The aperture to these can be closed at pleasure, thus insuring a perfect command over the moisture of the atmosphere. *g* is a chamber which formerly contained a flue belonging to the house that occupied the place of the one I am now describing. This chamber has been left with the view of its being useful for filling with hot dung, either for the purpose of assisting to maintain the heat of the house, or for destroying insects, thus anticipating Mr. Beaton's remarks of the week before last. The tanks and pipes cannot both be

worked at the same time, but they are fitted with stop-cocks, so that either can be worked at pleasure: and a few hours in the middle of the day, when the pipes are not wanted, is found amply sufficient to keep up the bottom-heat, as the mass of material, when once heated, retains its heat for a considerable time. I am keeping a register of the heat indicated by the thermometer out-of-doors, in the pit, and in the bed, taken every morning at daybreak—and of the quantity of coals consumed each day; and when the weather is sufficiently severe to test the efficiency of the apparatus, I will send it, if you think it will be interesting to your readers.—*G. Fleming, Trentham.*

THE ACCUMULATIVE SYSTEM OF CULTIVATION.—No. I.

AT page 756 of 1843 an instance is given of the benefit of a proper mechanical texture of soil in the cultivation of Schizanthus retusus, and evidence was produced to show that the proportions of material to be employed in potting are, to a great extent, regulated by its property of maintaining a uniform circulation of moisture during the whole growth of a plant, all other conditions being equal. In the same paper mention is also made of the success attending an application of manure (as a substitute for leaf-mould) in a partial state of decomposition, to such plants as are capable of deriving nourishment from nutritive material in a gross form; and the following instance is cited of high culture being attained by a treatment, which, at that period (1832), was deemed impracticable.

Having two store pots of seedling Balsams, which had remained for some time exposed upon the front platform of a greenhouse, and the season (the end of June) being too advanced to obtain seed from them under ordinary management, it occurred to the writer, that having dispensed with the process of shifting in the growth of Schizanthus, the same operation might also be avoided in the present case. To obtain healthy plants for the experiment, they were pricked off singly in 60 sized pots, and placed on the elevated front of a small greenhouse, where, with repeated syringing, and as high a temperature from sun-heat as the situation would admit, a vigorous circulation of sap was obtained. The following compost was used:—finely-pulverized vegetable mould, having the appearance of coarse black garden soil—to which was added an equal portion of half-decomposed, dry, friable manure in flakes, the latter *only* being passed, as far as it could be reduced, through a sieve of little more than two-eighths of an inch in the wire. 12 sized pots were prepared with a bottom drainage of one large slightly hollow potsherd, or two large flat potsherds, laid over the cavity half way, each upon the other's edge; upon these, as sub-drainage, were added two to three inches of large coarse flakes of similar manure (dried by exposure to the air) closely pressed. The plants were potted firmly in this well-incorporated material. An experienced gardener observing the process of potting, remarked that the writer would "rue that," meaning that the soil would prove incapable of sustaining the plants against a high temperature, and the variations of atmosphere to which they might be subject.

They were thus placed upon a tile platform and stage of a greenhouse, admitting a tolerable elevation and full exposure to light. There being no front lights, the position was well adapted for close treatment. In this situation they were subjected to as hot and humid an atmosphere as the weather would permit. Great attention was paid to giving air in the fore part of the day, for two, three, or four hours; and equal care was observed throughout the whole period of growth in maintaining a desirable temperature, by closing the house immediately on the indication of a change in the external atmosphere, as the only means of securing the highest possible degree of heat under the most unfavourable influences; and, on all occasions, when the intensity of sunlight would allow it, the house was closed (during the first and intermediate stages of growth), with a temperature varying from 70° to 90°, with requisite waterings and syringings over the whole house. By these means, a uniform and accumulated growth was obtained, to the surprise of those who anticipated opposite results. The emission of roots upon the stems, the uniform bloom, and the exuberant foliage, afforded ample proof that larger proportions of soil might have been applied with equal success. Gardeners inquired how many shifts these plants had received, and when their first growth was made; and when they were told that the position in which the plants then stood was the only one from the first shift, those cultivators could not understand the principles on which the experiment was founded, nor admit the progressive action and power of decomposed vegetable matter, when applied in a modified state, and acted upon by an intense atmospheric and solar agency. In this instance, they could not perceive that, in obtaining a simultaneous and uninterrupted growth, the means employed were equal to the effect; and that, in transferring the plants in a young and excitable state to large masses of soil, that the materials "were of a texture and quality adapted to their growth, and so mechanically arranged as to enable their tender organs to assimilate their food without being exposed to excess of moisture."* In fact, this first attempt to supersede the ordinary operations of shifting by the higher and more powerful agencies of Nature was misunderstood, and that important principle, that "atmospheric and solar agency should be so modified as to balance the power of absorption to which plants are exposed,"† and *vice versâ*, was entirely overlooked. By using portions of soil in a partially dried state, it was rendered applicable to the different stages of growth: 1st, mechanically, by its greater porosity; 2dly, nutritiously, by the gradual decomposition of organic remains in proportion to the power of absorption required for perfect growth. The foregoing instance of cultivation involves the following principles:—

1st.—For the attainment of perfect growth in plants, "it is indispensable that the supply of fluid by the roots should be continued and uninterrupted."‡

2d.—The accumulative vigour of all plants is exactly in proportion to the progressive agency of the cause to which they are first subjected.—*W. Wood.*

BEES.—No. II.

(Continued from page 5.)

Almost all the hives that are used about London are wider at the top than at the bottom, in order to prevent the combs from falling down; but if they were an inch or two wider at the bottom than the top or crown, the Bees would gather more honey, the process of taking out the combs would be facilitated, and the hives would not become awry so often. In the centre of the crown of each hive there ought to be a hole six inches in diameter, covered with a movable lid. To this lid a bit of comb (that working Bees are bred in) ought to be sealed, or sealed to a tally, and then pinned to the lid, to induce the Bees to make the combs run from front to back. Four or five sticks or stakes must cross from side to side of the hive, to which the Bees fasten the combs. Where sticks are thus used the Bees have passage-holes or by-ways in every comb at every stick. These by-ways are not in combs when sticks are not used. The door of the hive should be five inches wide, and nearly one inch high. The boards on which hives are placed should not be fastened to single pedestals, but be movable with the hives. That part of the board which projects in front, which the Bees arise off and alight on, ought to be eight inches broad and the same long; for if the Bees are gathering honey fast, coming home heavily loaded, they often miss the alighting-board, if it is small, and do not rise for a considerable space of time. "When a pheasant rises to fly," says Rennie, "it may be observed, first to fill its body with air by taking several deep inspirations, at the same time often rising on tip-toe, hopping a short space, and puffing out and balancing its body to feel whether it be light enough to rise." Though a pigeon does not thus hop previous to taking flight, yet it, like the pheasant, cannot go off at full speed without taking an inspiration or two. Bees, like the pheasant, generally run a short space before they

* "Paxton's Magazine," June. Page 110.
† Chronicle, p. 734.
‡ Lindley's "Principles of Horticulture," 302.

rise; but when the alighting-board is small, the Bees stand, like the pigeon, and take two or three inspirations, and in doing so obstruct the passage. The distance at which hives are placed from the ground, in most cases, is too great, for Bees sometimes miss even large boards, and experience a rueful shock when they reach the ground. Hives, then, ought to be placed within six inches of the ground, with an elastic turf under the alighting-board. That Bees are more healthy at a distance from the ground is but an idle dream of philosophers. Each hive ought to be placed on three posts or stones. That rain may run off the alighting board let the front post be a little lower than the two others.

Though Bees, when placed in a shaded corner, thrive pretty well, yet they thrive better where the sun shines on the apiary the greater part of the day; for Bees, as every good observer must know, fly faster, and are able to carry heavier burdens in sunshiny than in dull and cloudy weather. Hence, where the hives are much shaded, the Bees are apt to come to the ground before they reach them. At any rate, the Apiary should not be so closely encircled by trees as to cause the Bees to rise off the resting-board at an angle of more than 20 degrees. It may be well to remark that the excrement of Bees stains linen, and on account of this a Bee-yard ought not to be in the immediate vicinity of a drying-ground.

The Swarming of Bees.—Let us here see what takes place when Bees swarm. It must be borne in mind that a first swarm does, and a second does not leave the hive from want of room. Sometimes (generally about three days), before a first swarm is thrown, the Bees set one or more eggs in royal cells. It is not correct to say that "the swarm is led off by the queen," for she does not know whither it goes, though she follows, or rather goes with, it. About two-thirds of the Bees and the old queen form the first swarm. Though eggs are set often more and sometimes less than three days before the swarm quits the hive, yet let us suppose that in the royal cells were deposited eggs on the third day previous to swarming, and on the eleventh day after the queen's will be matured. The one that is matured first may be heard calling "off, off," in her cell. Her calling or piping being unanswered, she marches out of her cradle, and commences to call, as "peep, peep," or rather "paar, paar." Another queen is matured, and calls "off, off," which sounds seem to astonish the hatched queen, now monarch of the hive. She runs up and down the hive, crying "paar, paar;" that is, in our language, "Here am I—Where are you? death or victory." Perhaps one or more queens are matured, which call "off, off," in their cells. Having thus called for three nights a second swarm issues; that is to say, nearly the half of the Bees with the hatched queen leave the hive. While the swarm is in the act of leaving the hive, one of the queens bursts the lid of her cell, goes to the outside, runs and flies about the door for the space of a few moments, and then goes into the hive, fully expecting to be "crowned queen over all." If two should have left their cells one is put to death; but if the calling is continued a third swarm will issue on the second or third day after the second swarm issued forth. It is worthy of remark, that two queens go sometimes with the second swarm, but one of course is destroyed. If one queen only is going with the swarm, and sees or is seen by the other queen running about the mouth of the hive, a fatal contest takes place. When the queen of the colony, or swarm, or cast, is killed all the Bees return. If the following day be fine, the queens of both stock and colony come out, generally about 1 o'clock, to be fecundified. The Drones seem to be quite well aware that the young queens are about to appear, for a great part of them fly in front of the hives, "throwing their eyes around," and keeping as watchful as possible. When the queens come out they are pursued by all the Drones that see them, caught in the air, and brought to the ground, where, I believe, a union takes place. Sometimes the queens do not return; whether they fall in water, lose their way home, or mistake the hives, I am unable to say. As soon as the Bees are aware that their queens are duly impregnated, they begin to destroy the Drones. I learn from the "Honey Bee" that Bevan, Huber, Butler, and Reaumur believe, or have believed, "that the destruction of the Drones is effected by the stings of the workers." This is not the case, for the Drones are hungered to death. It is true that the Bees attempt to worry them, but they cannot do it. The Drones are banished from the combs to the boards, where, from want of food, they become so weak that they can scarcely fly. Some are unable to rise off the alighting-board, but the greater part die at a distance from home being unable to return. On an evening, about a week after the Bees have commenced to haul and maul the Drones, you may destroy almost all the Drones in one general carnage, and thereby promote the welfare of the community. This may be done simply by lifting the hives off the boards on which the Drones are sitting, and killing them with the hand, foot, or another board.—*A. Pettigrew, Wrotham Park, Middlesex.*

(To be continued.)

Home Correspondence.

The Pseud-Acacia.—Admitting, as I readily do, the durable nature of the wood of the Pseud-Acacia, or Locust-tree, and allowing that as a gate or rail-post it may even out-last one made of sound Oak or the heart-wood of the Larch; still I think your correspondent, "A. P., Cheam," estimates its value at much too high a rate, and is giving advice to inexperienced planters, which, if generally followed, they would have reason afterwards deeply to regret; as many of those have had occasion to do who some years ago gave implicit credence to Mr. Cobbett's praises and recommendations of this same tree. As regards the growth of the Locust, which "A. P." describes as being very rapid, I would observe that this precocious growth is restricted to the first 16 or 18 years of its existence, and that afterwards its advance is at a very slow rate; indeed, so much so, that I would venture to predict that the Oaks planted by "A. P." at the same time as his Acacias, though only, as he says, half the size of the latter when twenty years old, will, by the expiration of a like period, be greatly ahead of and nearly double the size of his favourite Locusts, provided his Oaks are fairly dealt with and proper attention be given to their management in regard to thinning, &c. Again, the Acacia, even when full grown, or say when 50 or 60 years old, rarely reaches dimensions to fit it for general building purposes or where a scantling of tolerable size is required. In North America, its native country, in the rich alluvial soils to which it is usually restricted, its average diameter when at maturity seldom exceeds a foot. In this country and climate, even under the most favourable circumstances, it can scarcely be expected that its growth should exceed that of the tree in its native habitats. Besides, though "A. P." would insinuate the contrary, it will only flourish in deep rich soil; and in addition to a rich soil requires from the succulent and spreading nature of its roots, an abundance of room. If inserted in mixed plantations, in spite of its rapid growth for the first few years, it soon gets overtopped, hampered, and destroyed by its neighbours; and this happens before it acquires a size sufficient to make a remunerative return. As an intermediate occupant, therefore, it cannot enter into competition with the Larch, which grows even quicker, requires much less room, with the further advantages of a long and straight stem, and which in point of durability, under similar circumstances, is but little inferior to the Locust itself. Upon clays, cold, wet, and tilly soils, it never reaches a useful size, but in a few years becomes stunted and decays at heart. The brittle nature of its branches is also (though "A. P." seems unwilling to allow it) another great disadvantage under which it labours, as it is almost sure to be much torn and injured by the winds, except in situations well sheltered from their effects: this is against its being planted extensively, even as an ornamental tree, to which, both as regards its elegant foliage and perfumed flowers, it undoubtedly has superior claims. The liking that hares and rabbits have to the bark and young shoots of the Acacia, is also, I may add, another objection to its extensive cultivation; as where they abound it is impossible to save the plants except by some artificial protection, which, under such circumstances, would become a serious inconvenience. The tree-nails adverted to by "A. P.," I may remark, are not ship timbers, but the wooden pins with which the planks are fastened to the frame of the vessel. Those made of the Locust are found to be of first-rate quality, and are imported into England and other parts of Europe in great quantities, and at a moderate rate, from North America.—*P. J. Selby.*

Nuts.—Mr. Borrow, in his "Bible in Spain," mentions a small town near this coast entirely devoted to the cultivation, for exportation, of the Filbert. Are Filberts ever imported from Spain, or is it a mistake of Mr. Borrow's? and is it the large Spanish Nut which is grown in that country, and which is so largely imported into England?—*Totty.* [We believe that there are only two sorts of Nuts imported from Spain; a soft or Spanish Hazel from the neighbourhood of Gijon, and the Barcelona from that of Tarragona. It is probably the latter that Mr. Borrow alludes to.]

Pine Apples.—Mr. Beaton's objections to the plan of planting out Pines, on account of their fruit ripening all at one time, may, I imagine, be easily surmounted. Most gardeners agree that larger and more robust plants can be obtained in a much less time when they are planted out than when they are under pot culture. The plants also are in a more favourable position for assimilating to themselves the food necessary for the production of large fruit. I have no doubt that all apparent obstacles in the way of planting out Pines will by and by disappear. Those who are afraid of the fruit all becoming ripe at one time would do well to lift the fruiting plants from the pit and put them into large pots; they might start them into fruit at any convenient time. Mr. Glendinning says, "by planting out Pines we can have them six feet high, but this is not what we want." If Mr. Glendinning can produce plants six feet high, and otherwise proportionately well grown, and lift them and fruit them in large pots, as above mentioned, they will no doubt mature larger fruit than if they had been subjected all through to the general routine of pot culture. After the plants have fruited they may be turned out of the pots, and planted out into the soil in the bed. Only one sucker should be encouraged, and in 12 months it will be sufficiently strong to be fruited.—*C. Ewing, Bodorgan Hall, Anglesea.*

The Amherstia nobilis.—The plant of this at Chatsworth having excited the interest of some of your correspondents, I inclose an extract from a work published in 1829, describing its situation and appearance when first noticed by an European in 1826. The soil in which I saw it grow is what, in Scotland, would be called a carse. I understood the tree to be confined to the Province of Martaban, and not to exist in any other part of the Birmese dominions. The locality is between the 16° and 17° of north latitude, and about 3° north of the limit within which the Durio and Mangosteen flourish; plants, the successful culture of which would seem, like the Vine and Olive in Europe and Northern Asia, to mark a botanical or at least an agricultural region. My friend Dr. Wallich readily found the two trees which are mentioned in the following extract, but he also discovered other specimens; all, however, within the same province.—*J. Crawfurd.* "At half-past two o'clock, the tide aiding us all the while, we reached Koquin, distant by computation twenty-five miles from Martaban. The scenery in this neighbourhood was grand and beautiful, the banks of the river high, and the country to all appearance peculiarly fertile. Close to the left bank of the river was to be seen a range of mountains, steep, bare, and craggy, rising to the apparent height of 1500 feet. Almost immediately on the right bank, and where the river makes an acute angle, a number of detached conical hills rose almost perpendicularly from the plain; all these last are of a grey compact limestone. We visited the largest, which contains a spacious cave dedicated to the worship of Gautama, and which, besides having its roof rudely but curiously carved, contains several hundred images of that deity; a good number of them of pure white marble from the quarries of Ava. Around the hill is a garden belonging to a neighbouring monastery. The only plant in it which struck us as remarkable, was a tree about twenty feet high, abounding in long and pendulous panicles of rich Geranium-coloured blossoms, and long and elegant lance-shaped leaves; it is of the class and order Diadelphia Decandria, and too beautiful an object to be passed unobserved even by the uninitiated in botany. Handfuls of the flowers as offerings in the cave before the images of Gautama." *

Standard Currant-trees.—As a matter of fancy, I have for some years grown Currants as standards; and observing the constant crop that clusters round the head, and the little room they require, I potted about this time last year several three-year-old trees, and placed them on the back stage of a greenhouse; they bloomed and set their fruit well, and ripened about five or six weeks earlier than the out-door fruit. They were trained with small heads, and with the ripe fruit were remarkably showy. They are very easy to manage. The cuttings should not be shortened back, but disbudded to the top bud, repeating the disbudding till it reaches the required height. A plant three years from the cutting yielded in my greenhouse about three pints of fruit.—*M.*

Ward's Cases.—In your observations on Ward's Cases in a late *Chronicle* you mentioned that one objection to them is the dimness arising from the condensation of the moisture on the inside of the glass. This reminds me of a fact which I once met with in a scientific periodical, where it was stated by a correspondent that, having a window in which a single pane was fixed in a metal frame, the rest of the sash being of wood, he observed in winter, that while all the panes fixed in the wooden sash were frosted, that one surrounded by the metal frame remained clear from dimness. The only satisfactory explanation given referred it to the different conducting powers of the wood, glass, and metal; the latter being a better conductor of heat than the glass, because the channel of transmission, in equalising the temperature outside and inside the window, thus received the deposition of the redundant moisture in preference to the glass which it surrounded; and, in like manner, the glass being a better conductor than the wood, received the deposition of moisture in preference to the latter which surrounded it. The panes fixed in wood became frosted, while the one in metal remained clear and dry. If this solution be correct, it points out a method of obviating the deposit of moisture on the inside of the glass of Ward's Cases, without having occasion for a door or other opening. The instances appear to be analogous. The moisture held in suspension at a higher temperature begins to be deposited as that temperature becomes reduced. If the glass itself be the channel of communication through which the reduction of temperature takes place, the deposit will be on the glass; but if the glass be fixed in a frame of metal, bearing a proper proportion to the extent of glass, the function will be removed from the glass to the metal, and the former will remain dry and clear.—*J. H.*

The Constitutions of Plants.—The popular opinion that plants become naturalized, that is, adapt themselves to our climate, is a great error, and productive of much loss. The Dahlia, Heliotrope, Marvel of Peru, Potatoes, &c., are just as susceptible of frost now as when first introduced. When we hear of plants becoming hardy, as it is termed, it will generally be found that it is our ignorance, in not being sufficiently acquainted with their local habitat, an instance of which may be adduced. The Aucuba japonica, coming from a hot climate, was treated accordingly, by being placed in a stove, forgetting that the altitude of a country has great influence. The winter in Japan is very severe; India in general is very hot in the plains, whilst in the mountainous parts it is very cold! therefore, the Berberis, and other plants introduced from Nepal, are quite hardy. I could give several other instances, but sufficient has been given to enable us to arrive at the conclusion that plants retain their original constitutions unchanged.—*J. R.*

Cut Wood to have Wood.—I have no ordinary satisfaction in acceding to your wishes of laying before you the result of my planting in North Wales, as I am thoroughly persuaded that the mode of pruning which I have adopted has increased the bulk and improved the quality of the trees which have been subjected to annual pruning. I began planting as far back as 1804, in a most mountainous district, and a soil most ungrateful. As soon as the trees were removed from the nursery, I commenced pruning them, cutting two, three, or four branches, which I have continued annually, with a strong knife, close to the stem, beginning invariably at the top of the plant and descending, so as to leave the leader without a rival and balancing the

* "I showed the dry specimens of this plant to my friend Dr. Wallich, on his arrival at Rangoon, about four months afterwards, and he soon ascertained that it constituted a new genus. He afterwards examined it in person on the spot, transferred it to the Botanical Garden at Calcutta, and described it under the name of Amherstia nobilis in compliment to the Countess of Amherst."—*Crawfurd's Embassy to the Court of Ava*, 1826.

tree as well as I could. My woodman, as well as his assistants, have persevered in this system at all seasons of the year, and the same tree once or oftener in the year, according to circumstances. As compared with others of the same age in similar situations they fully demonstrate the advantages of judicious pruning; for I do believe that more woods and hedge-row trees have been injured by pruning at distant and uncertain periods than by neglect: hence pruning, by superficial observers, has been unreasonably condemned as injurious to the growth of trees. I will call your attention more particularly to the plantations which I made in the year 1814. They have been pruned and thinned annually since that period, by taking off from 3 to 5 branches, as before described, and the result has been that the sap which the cut branches would have exhausted has given vigour and increased strength to the trunk, as is evident from the healthy appearances of the trees as well as their augmented size. I have planted those trees which the soil most loves—Oak, Larch, Ash, Sycamore, and Elm; and I often lament that gentlemen put into the ground plants without any discrimination of kind or size, consulting the nurseryman, whose object is to sell those plants which encumber his grounds. In a late Number you state, "In 26 years, Oaks, Larch, and Ash are to be found 20 feet high:" you should have added—"up to the first branch." Further—"Dr. Thackeray is represented to be continually trimming his trees up by removing the side-branches"—it should have been removing "all large or luxuriant" side-branches.—*W. M. Thackeray, Chester.*

Colour of Carnations affected by Compost.—It has been said that salts of iron tend to heighten the colour of flowers; Johnson's Almanack says, "increase the intensity of red flowers." In describing the Carnations at Messrs. Norman's, last season, the *Chronicle* observes, that Hufton's Patriarch is too thin, but that the colours are "intense." So I found them. My compost consisted of old mould from a vegetable garden, two parts—old horsedung one part, and a little charcoal. I had grown two pairs of this flower the year before, but one was sickly, and the other run—*i. e.*, the red was lost However, I layered the run pair, and last season the layers bloomed clean and were fine plants. The flowers were evidently attractive, for a florist visited the garden without pausing before them; the white was remarkably clear, and the colours brilliant. Towards the close of the season, I chanced to visit a garden, the situation of which surpasses mine as much as the owner excels me in every quality that can constitute a florist. Here I saw several plants of Patriarch planted in a border of rich reddish-coloured soil (turned up about two years ago), but the white was quite flushed, the colours looked muddled and confused, and my friend said he was greatly disappointed with the flower, and should not grow it any more. The plants were much stronger than mine, which were in 12-sized pots. My compost had laid two winters, and was well blended; the rough stones were riddled out, and the charcoal added at potting. I could not succeed in impregnating Patriarch, although a thin flower. The style is long, thin, and in three divisions. The Pink called Barratt's Conqueror has a similar style. I never could get seed from it, though I had plenty of pollen from different varieties to cross it with, and took care to keep it dry. Bees do not seem to impregnate these flowers. In a garden where several hives were kept in the midst of a large stock of Carnations there was frequently no seed-flowers of Pinks, which were carefully impregnated and marked, produced seed, but no others on the same plant.—*J.*

Planting.—I think your Paper has increased in interest since you have taken up the subject of planting and pruning, and that parties entertaining different views on those subjects have placed them before the public through the medium of your Paper, so as to excite inquiry. So long as such discussions are carried on in the spirit which has at present shown itself, good may be expected to result from them. I have read the papers on the subject of planting and pruning, particularly on the 23d Dec., and I expect much good may result from the various opinions there given, and from the candour of the Editorial passages; but in one of those letters, "Quercus," I think, is advised to see what has occurred in the plantations at Nerquis, near Chester. Now the distance from London to Chester being not more than ten hours' travel, I had hoped he would have availed himself of this suggestion, and ascertained by his own inspection the correctness of the statements in regard to these woods, and whether the system pursued there ought to be followed or rejected. I consider the permanent adorning of mountains and valleys with timber an object of such vast importance to the public, that no individual should continue to write for the eye of the public adverse to any system, the value of which he has an opportunity of examining in person, until he has done so.—*Sub Arbore Felix, County Kerry.*

Excrescenses on Timber.—I observe that your correspondent, W. Billington, (p. 909,) calls the attention of the readers of the *Gardeners' Chronicle* to some Oak trees in Porkington Park, near Oswestry, which he says are infested with excrescences of great thickness, and he then goes on to say that it appears that the timber in all such trees is shaky and of little value, and that it is curled at these excrescences by the young shoots apparently growing on dead or decaying timber; and he ends by inquiring into the cause of this. Having paid some attention to these excrescences for some years, I will endeavour to reply to his observations as they arise: first, as to the value; so far are these trees from being worthless that they are ten times as valuable as if they were plain; these excrescences when cut into veneers being most beautifully mottled and figured; and so highly are they valued by those cabinet-makers who can work them, (they are very few,) that I have known a tree of this sort sell for 100*l.* to a Leeds upholsterer. It is true that, owing to their conformation, and the long time required for seasoning all kinds of Oak-timber, they are very difficult to manage; and after having paid attention to the subject for 20 years, I do not know that I am competent to give good advice upon it. The best plan appears to be to let the tree lay in the log at least four or five years before cutting it into planks, and these planks ought to lay for two or three years before being cut into veneers; for if cut into veneers soon after the tree is felled, the shrinking of the wood and the various contortions which its mode of growth has a tendency to give it, pucker and draw, and twist them in so many directions, that the veneer is often shaken to fragments, not because the tree was originally so, but because it has been seasoned improperly. This peculiarity, and the very great difficulty there is in laying the veneers, detract much from the value of curled Oak, but it is (or was, at least some years ago) so fashionable a wood, that a good tree was worth a large sum of money notwithstanding. All curled trees, of whatever kind of wood, are valuable for this reason, if sound, and the curl has nothing to do with unsoundness, *per se*. I have myself some furniture made of the curled Elm, which I consider even more beautiful than the curled Oak, and it does not require half so long a time to get it into season. Whatever may be the cause or cure, it has certainly nothing to do with unsoundness; as I know many trees curled all round, which are growing as vigorously as any of their neighbours, and on felling curled trees I find they have the usual quantity of sap-wood upon them, but quite as much curled as the heart. This is very evident in the Elm, where the heart-wood is a fine brown, whilst the sap is white; and so far is it from being owing to the decay of the tree, that I have trees now growing not thicker than my thumb, in which this peculiarity is very evident. It appears to me that the cause is a tendency which the tree has to throw out roots from every part of its stem; and many kinds of Apples can, for this reason, be grown from cuttings as easily as so many Willows. I think it has little to do with soil, but is a constitutional peculiarity connected with variety; as in raising Crab-stocks for grafting, nurserymen will find individual plants showing this peculiarity, whilst the generality of them, although raised from the seed of the same tree, and growing in the same soil, show no such tendency. Many kinds of English timber trees are more or less affected in this way; those showing it most frequently are the Oak, Elm, Alder, Maple, Yew, Beech, Apple, Cherry, and occasionally the Ash, but I never saw a Pear-tree so affected. The celebrated Cayabuco-wood (Amboyna wood) of the East, is a production of the same kind. Recurring again to value, it is worth while ascertaining whether the twistings and contortions which detract so much from the value and beauty of curled Oak could not be remedied by injecting the tree with some extraneous matter which would fill up the pores, and prevent shrinking. According to the plan of M. Boucherie, mentioned in the *Chronicle*, at p. 911, if this could be accomplished successfully, this curled wood would be extremely valuable, as it far exceeds any other wood in beauty, the curled Elms and Yews being probably in the first class. But this is a matter of opinion, many preferring the Oak, perhaps on account of the extravagant price at which articles of furniture of this wood sell for when well made. A person of my acquaintance contrived to get some wood from one of the old Yews, near Fountains Abbey, which are said to have sheltered the monks before the abbey was built; this tree had been blown down by a strong wind, and proved to be most beautifully curled, but from its great age was too far decayed to be valuable, otherwise than as a relic of old times. In confirmation of what is said at p. 911 about the injury of coal-tar to timber, allow me to add the following fact:—A gentleman in Yorkshire had his trees much damaged by the deer in his park, and to prevent them barking them any more, he had the stems painted with coal-tar—it is true, the deer no longer attacked them, but most of them were killed by the application.—*T. G., Clitheroe.*

Cucumbers.—In reply to "Veritas," I beg to say that the Cucumbers exhibited by me at Regent-street, on the 5th of December last, were both spined, but one was ribbed and the other was smooth. My plants, both last season and also this, were propagated from cuttings; they were taken from one plant true to its kind, and the two plants subjected to experiment were grown in the same sort of soil and received the same treatment as respects heat and moisture. If, therefore, the stimulants used did not cause the difference, to what can it be attributed? "Veritas" says, "I conclude the real cause of the difference was a sporting of the variety." I am aware that Cucumbers have a tendency to sport, but this, in this instance, certainly was not the case. Hydrangea cannot be said to sport, although it is known that three different shades of colour may be produced by cultivating one in Norwood loam, another in a good Hazel loam, and a third in black fen bog, destitute of sand, and watered with a solution of alum and saltpetre. In a similar way are Dahlias, in different localities, affected by different soils.—*James Stewart.*

Canker in Auriculas.—I am sorry that Dr. Horner should think I had not attended to his Treatise on the Auricula. I have read it many times. Two things of importance I found in it: one, the time of potting; the other, the insertion of half-decayed leaves. The latter was not quite new to me. I had often seen Auriculas potted with the decayed leaves, vegetable mould, &c. from old fences; but the florists who used this compost often had unsound plants, arising most likely from bad drainage, or drip, or other causes. My own plants were very healthy, though not luxuriant. They were potted in sandy peat with some cowdung. I have the same Auriculas now that I had nine years ago. Latterly I have made up a compost for them in the month of July or August by stacking sods and weeds with layers of long dung. This soon becomes very hot; and when in the course of time it is sufficiently reduced and incorporated, I take two parts of it, one part old cowdung, and half a part sharp white sand. I have used half-decayed Auricula-leaves, rags, and Fern, gathered green and laid in a heap to ferment, and sometimes I have dropped in some Lichens from the rocks and trees, with the black mould adhering to them. Every plant seems to like Fern-leaves and rags. The cankered plants which I had this year were some that I bought in spring, ready potted. On turning them out, I found a want of drainage; in some of them merely a single crock over the hole. Then they had been placed on the ground—worms had entered, and reduced the soil to a mud-paste. I never place my Auriculas on the ground, but I have seen it done by florists of some repute; and they have told me that I starved my plants by shelving them. It is true the soil in their frames was hard-rammed or trodden. I never tried the plan of sawing out the shelves to admit air to the roots, but I once happened to have some pots that were nearly cylindrical, and deep enough to allow of 4 or 5 inches of crocks. However, the plants did not thrive in them. They will grow well enough in square boxes, not too deep. I turned out into a dry poor border an Auricula of the white-edged class about 15 months ago. In winter it was partly covered during rain and frost with a pot; when I took it up, the tap-root was 4 inches long, and quite sound. I had top-dressed this plant on one side with rich compost, and on the other with charcoal earth mixed with old manure; and the fibres on this side were much whiter and healthier-looking than on the other. But charcoal-earth used as topdressing soon becomes mossy. It has been used for many years by some florists in the West Riding for an ingredient in layering, compost, piping, &c., and I believe with advantage.—*R. F.*

Mr. Loudon.—Though I am exceedingly grateful to the writers of the two letters relative to my affairs, which appeared in the *Chronicle* of Dec. 30th, I do not think it would be just to the memory of my late husband to permit the assertion that he left his family in a destitute state, to remain unexplained. He died possessed of the copyrights of 13 works, the profits from which have been so considerable that in little more than five years they have reduced a debt of 10,000*l.* to 2,400*l.* It is true that this latter sum, which is a very large one, is still owing, and that we appear at present to have no means of paying it but by the sacrifice of the copyrights; but should the same kindly feeling be extended to us that was shown to Mr. Loudon during the fortnight before his death, the debt will soon be paid, and the copyrights will remain for the benefit of the family. The appeal addressed by Mr. Loudon to the public appeared December 1st, and between that day and December 14th, the day of his lamented death, books to the amount of upwards of 300*l.*, were most liberally purchased by a number of the nobility and gentry, whose names would have appeared in the *Gardeners' Chronicle* ere this, had it not been for the melancholy event which has taken place. At present I do not know what my friends will consider best to be done; but I can only say that if any plan can be devised by which the public patronage can be obtained so as to enable us to preserve the copyrights alluded to, I shall be most truly thankful.—*J. W. Loudon, Bayswater, Jan. 3, 1844.*

Societies.

AGRICULTURAL SOCIETY OF CALCUTTA.

AT the general meeting of the Agricultural Society, 18th October, amongst other proceedings, a memorandum from the overseer of the Society's garden mentioned that about 20,000 Canes, consisting of the Otaheite, Singapore, Bourbon, and China varieties, were ready for cutting; and it was agreed that these Canes should be advertised for distribution at the same charge as that of former years, viz., one anna for each Cane. The secretary mentioned that he had submitted Mr. Sconce's sample of Tea, grown and manufactured at Chittagong, from leaves of Assam plants, to Mr. Charles Terry, and that gentleman had made the following report thereon:—"I have examined the sample of Tea you sent me, the produce of Chittagong. It is a superior Tea in flavour, also in strength, and is of the Pekoe class. Had it been well manufactured, it would command a good price in the English market." A letter from Mr. Stikeman, secretary to the East India and China Association, stated that, by the intervention of Dr. Royle, some nuts of the Cacao had been procured for the Society from the West Indies; and a letter from Capt. Marquard communicated the transfer of the greater portion of the Chocolate-trees in his garden at Chittagong to that of the Society. On the 8th Nov., in consequence of the paucity of applications for Sugar-cane, the charge was reduced to one-half.—*Indian Mail.*

COUNTRY SHOWS.

Ipswich Cucumber Society, Jan. 3.—This was the annual meeting, and on this occasion a very handsome supply of game was sent for dinner by the President, the Right Hon. Lord Rendlesham, M.P. After the usual loyal toasts, the following were some of the Horticultural:—"The health of Lord Rendlesham, P. B. Long, Esq., and the Vice Presidents," &c. &c. "Dr. Lindley, and success to the *Gardeners' Chronicle and Agricultural Gazette.*" "To the memory of the late J. C. Loudon, Esq. (whose zeal and talent as an author, on Gardening and other subjects connected with rural and domestic economy, has justly won the golden opinions of scientific men, both at home and abroad); and may the leaders of the gardening republic henceforth prove themselves as worthy of our esteem." "To Mr. Beaton, well known from his writings in the Calendars of the *Gardeners' Chronicle.*" Also, "Success to all Cucumber Societies,

and may they soon make known their Show days for 1844." After a discussion on Cucumbers, the new system of cultivating Pines, the cure of scale, and Rendle's Tank system, on which the meeting could not understand how the necessary *top-heat* was procured, the evening was spent in the greatest harmony and conviviality.—*Thomas Wild, Hon. Secretary.*

Lancaster Practical Horticultural Society.—On New Year's Day the report of the progress of the Society for the past year was read by G. Bevan, Esq., from which it appeared that nearly 300 prizes in the various classes of Fruit, Flowers, and Vegetables, were distributed to the gardeners who were competitors at the three exhibitions in 1843. The late treasurer, Mr. Bevan, has been obliged, by other avocations, to resign the treasurership and management of the exhibitions, which has been so successfully conducted by him during the past three years. Mr. W. Wilson has been elected in his room.

NOTICES OF NEW PLANTS WHICH ARE EITHER USEFUL OR ORNAMENTAL.

PHASEOLUS CARACALLA. The Snail-flower. (*Stove Perennial.*) Leguminosæ. Diadelphia Decandria.—None but a Botanist would, at first sight, detect any resemblance between the flowers of this extraordinary plant and those of the common Kidney-bean. And yet they both belong to the same genus. Many curious instances exist in the vegetable kingdom, in which observers have found some real or fancied similarity to objects in the animal world: and the one before us is by no means the least noticeable. In the spiral form of the folded flowers, ere they are expanded, there is assuredly something not unlike the anatomy of the snail. And though the thing with which the flower is thus compared by no means augments its interest, from association, nothing but the figure of the snail, and not its repulsive character, is thought of while we admire this singular and really delightful production. Having been one of the first exotics cultivated in this country, it has lost much of its attraction in modern times. Indeed, it is rarely seen in collections of stove plants: we learn, however, that it has recently acquired the name of Glycine or Wistaria Harrisonii, and in that way is being put forth as a novelty. The species is a deciduous stove-twiner, native of the East Indies, bearing long racemes of large flowers, which are of a purple and yellowish hue. They have a very graceful appearance, depending from the slender branches. The plant can be cultivated with difficulty in a slightly enriched loamy soil; but it is said to be liable to the attacks of the red spider, from which it may be kept free by syringing, and by placing it in a moist atmosphere. It is a good plant for training up the rafters of a house, where its fine racemes of bloom will be shown advantageously. It is a rare and highly ornamental plant, with very fragrant flowers, and of difficult management. In many parts of the south of Europe and the north of Africa it is grown for culinary purposes; the pods, we presume, being the parts used. The Portuguese, who introduced the species from South America, named it Caracalla, in consequence of its hooded flower. It is one of that rare class of plants which combine the ornamental with the curious.—*Paxton's Magazine of Botany.*

TACSONIA PINNATISTIPULA. Mrs. Marryatt's Tacsonia, or Passion flower. (*Greenhouse Climber.*) Passifloreæ. Monadelphia Pentandria.—This truly handsome plant is not cultivated so much as it deserves to be in the greenhouses and conservatories of this country, considering how long it has existed in our collections, and how readily it may be increased by cuttings. It is a native of Chili, and was introduced by Mrs. Marryatt, of Wimbledon House, about the year 1830. Nor do we think the trial has fairly been made in the open air, to ascertain whether it could not at least be made to flourish during the summer months, by protecting the roots in winter. The native climate of this Passion-flower is not so warm as that of our Passiflora cærulea. With us, in the Royal Botanic Gardens, it is trained to the back-wall of a cool greenhouse, where it flowers in the summer months.—*Curtis's Botanical Magazine.*

ONCIDIUM BICOLOR. Two-coloured Oncidium. (*Stove Epiphyte.*) Orchidaceæ. Gynandria Monandria.—This charming species of Oncidium, one of the rarest of its genus, was obtained by Messrs. Loddiges from the Spanish Main, and is 1243 of their catalogue. It flowered with them in September, 1842. Among other peculiarities of the species may be mentioned its very thin pseudo-bulbs and three-lobed crest of the labellum, the front lobe of which projects forward, while the laterals are at right angles to it and slightly toothed. It has, moreover, a very large lip, which although deep clear yellow on the upper side, is almost white underneath, as also happens in some of the Chive-leaved species. Its nearest affinity is with O. bifolium.—*Botanical Register.*

BOSSIÆA FALCIFOLIA. **Few-leaved Bossiæa.** (*Greenhouse Shrub.*) Leguminosæ. Diadelphia Decandria.—This New Holland bush, which has been raised several times from Swan River seeds, is one of those plants whose appearance depends chiefly upon the way in which it is managed. Under ordinary circumstances it is a straggling, naked, inelegant species; but when kept dwarf, and in very good health, it forms a pretty compact bush, gaily sprinkled with yellow and crimson blossoms. It was originally raised from seeds by Robert Mangles, Esq., of Sunning Hill; and in July, 1841, it was named and defined in this work by Mr. Bentham. Afterwards, in December, 1842, it was figured in the "Botanical Magazine" under the name of B. virgata, Sir William Hooker not being aware that it had been already published. It is a greenhouse shrub, and will best succeed if potted in rough peat mixed with a little loam and sand. When potted, the stem should never be immersed in the soil, but rather a little elevated, which will preserve the plant from damping off in winter. In summer an ample supply of water should be given, and air at all times. In winter it should be exposed as much as possible to the light, and always receive air when the weather will permit. Fire heat should never be applied, except to keep off frost. It may be propagated from seeds or cuttings.—*Botanical Register.*

GARDEN MEMORANDA.

Lee Hall, Little Woolton, near Liverpool. — The Orangery at this place contains an excellent collection of the best sorts of the genus Citrus. The greater part of the plants are growing in pits, and furnish a striking example of the superiority of this system over that of growing them in pots or boxes. The golden fruits of this genus, reposing among the lively green leaves that under good cultivation the tribe always carries, has an interesting effect at this time of the year, when there are but few flowers to enliven the Conservatory or other ornamental plant-houses. Were it only for its beauty, to say nothing of its usefulness, this tribe merits attention. One half of the back wall of the Orangery is covered by a plant of Psidium Cattleyanum, bearing excellent fruit; the other half by a plant of the common Shaddock, also bearing some fine fruit. Passing into a Pine stove to the west of the Orangery, the visitor is delighted at the beautiful appearance of the Oranges, Citrons, &c., trained over the back path. A border a little more than a foot in breadth is partitioned off from the back of the bark pit, running its whole length and depth. In this border the Oranges, Citrons, &c., are planted; and in this situation the plants have the advantage of a little bottom-heat, as the partition is but the thickness of a brick set on edge. The branches are trained on a wire trellis over the back path, and bear an abundance of fine fruit every year. At one end of the arch a Shaddock bearing very large fruit is a conspicuous object. The back path of a Pine stove on the east side of the Orangery is covered with Oranges, &c., similar to that in the house already mentioned, and growing with equal luxuriance. Adjoining this stove is a house about 70 feet in length and 24 in breadth, which the gardener, Mr. Piggot, informed me is intended almost entirely for Conservatory climbers. The greater part of them will be planted out in the borders inside the house, and will doubtless have a fine effect. At present the house is principally occupied by Orange-trees, Amaryllidaceæ, and select bulbous plants of various genera. The Greenhouse contains principally a stock of young plants, which are designed to render it gay during summer. In the centre of another range of stoves is a small house devoted to the cultivation of Musa Cavendishii. The central pit is filled with earth, in which the plants are luxuriating. One of these plants is carrying a very large bunch of fruit. Mr. Oakhill, the proprietor, has paid great attention to the culture of all kinds of bulbous plants; and the many fine specimens among them bear ample evidence of good treatment. The Amaryllises at present in flower are chiefly hybrids, between vittata and Johnsonii, some of them exceeding either of their parents in beauty, and all of them very showy. For a Conservatory Amaryllidaceæ possess so many good points in their character that they cannot be too strongly recommended. The greater part of them produce large gorgeous flowers; they are easy to cultivate; may be made, when well managed, to flower at any season; and take up little room. The varieties, by hybridising, may be multiplied almost to infinity. The collection of Orchidaceæ here is but small, Mr. Oakhill having only recently commenced growing them. Numbers have lately been received from the Organ Mountains in Brazil, some of which appear new, but have not yet flowered; amongst them is a pretty little Odontoglossum in flower, which I have not seen elsewhere. A large plant of the old Phaius grandifolius, with 12 or 14 spikes of flowers, and Bletia Shepherdii, with Neottia speciosa and Rodriguezia recurva, are all finely in flower. Ardisia crenulata and Euphorbia jacquiniflora are, as is usually the case when well treated, now very showy; the latter plant occupied a small square pit in the corner of a bark bed, and is thriving well. The Pines, which occupy six of the central pits in the like number of houses, are looking very well and some of them are carrying fine fruit. There are no houses entirely devoted to Vines, they are planted in borders in front of the Pine stoves, and trained up the rafters over the Pines. —*J. W. Jones.*

Miscellaneous.

The Elæagnus reflexa, of Japan.—This plant was introduced from Belgium, into the Garden of Plants, at Paris, in 1837. It flowered for the first time in the open air in 1841, but more abundantly in October, 1842. It is a very branchy shrub, the largest plant of which is now three yards high. The leaves are alternate, and evergreen. The little bunches of flowers are solitary at the axil of the leaves, and there are three or six flowers together in a cluster, which is about half an inch long. This shrub is worthy the attention of Horticulturists, as it can endure the rigour of our winters, notwithstanding that it is always growing. In this it resembles our Alaternuses and Phyllireas; but it is certainly to be preferred on account of its elegant foliage and odoriferous flowers, which are as sweet as those of the Bohemian Olive, but less penetrating. It can be easily propagated by cuttings put under a bell-glass, and kept in a mild, damp atmosphere. Hitherto it has been grown in peat, in a shady situation. It would fruit, perhaps, in a proper soil, if that could be made.—*Rev. Hort.* [This is apparently the Elæagnus parviflora, mentioned at p. and figured in the "Botanic Register" for 1843, tab. 51.]

Poisonous Nature of Hemlock and Oleander.—A case of poisoning with Hemlock (*Conium maculatum*), occurred lately in consequence of the ignorance of a cook-maid, who had mistaken the above plant for Chervil, and as such employed it in a salad, all who partook of which became seriously ill. It may be remarked that the Hemlock would not have produced so bad an effect if it had been employed in soup, or in any preparation requiring fire-heat. The poisonous principles of the Hemlock (*coneine*) is volatile, and disappears by boiling. The cook-maid declared that she had employed this plant some days previously for soup; and she persisted in saying that it was the same as that which caused the illness when used in salad. A few years ago, a child died from having eaten one morning a quantity of Oleander flowers. The child was seized with violent colic, and whilst the cause of its indisposition was unknown, the symptoms soon assumed an alarming character, that of a burning fever, under which the child sunk at the end of two days. With reference to this last case we may mention the following, related by Professor Richard. In 1809, when the French troops were lying before Madrid, some of the soldiers went a marauding, every one bringing back such provisions as could be found. One soldier formed the unfortunate idea of cutting the branches of the Oleander for spits and skewers for the meat when roasting. This tree, it may be observed, is very common in Spain, where it attains considerable dimensions. The wood having been stripped of its bark, and brought in contact with the meat, was productive of most direful consequences, for of twelve soldiers who ate of the roast seven died, and the other five were dangerously ill. An order of the day was issued next morning, interdicting the cutting of the Oleander. This plant belongs to the Apocinaceous family, of which nearly all the plants are deleterious, and contain a white acrid juice, more or less thick, and produce eruptions if applied to the skin. M. Pépin states that during the wars of Italy, an instance of poisoning occurred in consequence of soldiers employing branches of the common Laurel (*Cerasus Laurocerasus*) for roasting their meat.—*Revue Horticole.*||

Experiments on various Flowering Plants, with Guano and Nitrate of Soda. By J. E. TESCHEMACHER.—Small parcels of the new manure Guano having been very generally circulated in this vicinity, it is right to put those in possession of it on their guard against using it too freely, many plants in England and some here having been killed for want of proper care in the application of it. Guano is an extremely powerful and warm manure, and if applied in large quantities, or in lumps, destroys the roots. For Pelargoniums, Roses, and all hardy, strong-growing plants, one teaspoonful to a quart of earth, or about 1 part in 100, is sufficient; it should be pulverised and well mixed with the earth in which a plant is to be repotted. When it is not convenient to repot, the earth may be gently stirred on the surface of the pot one or two inches deep, and the Guano pulverised, then mixed in; the plants should be kept well watered. Besides Pelargoniums and Roses, I have tried it on the Myrtaceous family, on Ericas, Fuchsias, and Camellias; its effects on these are equally surprising. I have been also trying experiments on various plants with nitrate of soda; in every case I placed two plants, of the same species and of nearly the same size, close together; one of them was watered three times a week with a very weak solution of this salt, the other was under the usual management. The effect of the nitrate of soda has now become very evident, the plants watered with it are larger and earlier in bloom than the others; it appears, however, to me, probable that these effects will be rather evanescent, and the plants will always require this stimulant. I observe in the English publications, that this constant necessity for the stimulant is urged against all these new manures, but surely there is no strength in this argument. All manures become exhausted, and the farmer has always to apply the stimulant of his manure-heap to make his land bear. From some experiments I have made, I think that Guano will prove a manure of much greater permanence than any that is now in use, particularly in soils deficient in phosphate of lime.—*Hovey's Magazine of Horticulture.*

Adulteration of Sugar.—A supply of crushed sugar arrived in Perth, a few days ago, with all the appearance of adulteration. Samples have been submitted to chemical tests, but hitherto, we understand, without detecting the peculiar ingredients of admixture. To appearance it is some mucilage or starchy substance, giving the sugar a peculiar clammy moisture, as well as smell. Suspicions of adulteration have been entertained here for some time, not only in crushed, but in lump sugar. A large quantity of the latter having been dissolved previous to being boiled with fruit for jelly, was found to contain a large portion of glutinous or starchy matter, but the exact ingredient could not be ascertained.—*Perth Courier.* [*We* never saw or heard of such an adulteration of loaf or crushed sugar, and rather doubt it; brown sugar is often, and to a great extent, adulterated with various cheap substances like that described, but we do not understand how loaf-sugar could be so adulterated.]

CALENDAR OF OPERATIONS

For the ensuing Week.

I.—HOTHOUSES, CONSERVATORIES, &c.

Stoves.—If the paths, stages, plants, &c., are kept clean, and the heating apparatus is in a good working condition, there will be little necessity for giving much air, at this season, to stove plants at rest and in dull weather. Formerly, currents of air were thought so indispensable to plants at all times, that increased fires were made purposely to rise the temperature higher than was necessary, in order to keep up these currents.

Conservatory.—A great step towards the proper management of stove plants in winter was made when those in flower at this season were found to do well enough in a temperature averaging 45° in the conservatory. Euphorbia jacquiniflora is the best stove plant we have for winter, and the flowers are even more brilliant in the conservatory than in the stove. Among the forced flowers the Narcissi, Hyacinths, early Tulips, with some of the different Roses, are now the most prominent; Sweetbriar is always welcome in winter, and no place should be without Mignonette in pots and boxes. Polygala chamaebuxis, a very dwarf old plant, is excellent for forcing, and will keep a long time in flower in any dark corner where little else would thrive; it requires abundance of water.

Greenhouse.—There are frequent failures from careless watering of greenhouse plants in winter, not by too much, but the contrary; the best criterion is to have all the soil in the pot of equal dampness throughout, and something between wet and dry. Keep these and all other plants free from dead leaves and insects, and neatly tied up to stakes, or trained, according to the habit of the plants.

Forcing Pits.—These are now crowded with Roses, Lilacs, both the common and Persian, Sweetbriar, Cinerarias, Hyacinths, Tulips, Narcissi, Jonquils, Anna Boleyn Pinks, Gardenias, Rondeletia speciosa, Franciscea Hopeana and latifolia, Acacia of sorts, Crotalarias, Pelargoniums, Chinese and other Azaleas, with Rhododendrons, Andromedas, &c. These may be syringed once a day, and smoked occasionally, and a temperature of from 55° to 65° should be maintained.—*D. B.*

II.—FLOWER-GARDEN AND SHRUBBERIES.

Out-door Department.

The remarks of last week in this department are still applicable. As the weather is mild, the planting of shrubs and trees may be proceeded with, as may also the pruning, where pruning is necessary. This is a good time to lay new turf, or repair turf edgings.

Reserve Garden.—All the spare ground in this department, if not already dug, should be laid up into frost-ridges; and where the ground is heavy, a good dressing of leaf-mould and sand, 2 or 3 inches thick, will do much to improve it. Take advantage of frosty weather to get in a quantity of sand to plunge half-hardy plants into when hardening off for the flower garden.

Pits and Frames.—Take advantage of the first leisure hour to "take stock" of the plants for bedding out in these structures; and if you have not sufficient stock of some kinds, introduce a few plants into heat to produce cuttings to propagate from.—*W. P. A.*

III.—FLORISTS' FLOWERS.

Directions for the management of this department of Flora's kingdom have been given in various shapes in almost every work on Floriculture that has hitherto been published, so that any one attempting a similar directory may very easily be charged with plagiarism, and accused of re-issuing other Florists' opinions. The writer of the accompanying memoranda will not, however, be deterred from recording his opinions because they may happen to coincide with some other writer's previously published. They will be the result of many years' experience, added to observations made during the current year.

Auriculas require great attention just now. If healthy, they will withstand intense frost with impunity; care must be taken to remove decayed leaves, stripping them downward to avoid wounding the stem. The surface soil should be kept stirred, and the plants be allowed all the air possible; bearing in mind that drip or too much moisture at this season is their bane.

Polyanthuses must have all trusses of flowers removed as they show themselves, if good blooms are to be expected at the proper season of exhibition.

Tulips are peeping. Cover on frosty nights with mats on hoops placed across the bed. If sand is put on them it must be white or Calais sand, as I have known parties who covered with pit sand, impregnated with iron, which had a most deleterious effect on the foliage afterwards.

Carnations must have all air possible; if they are well established, and of a fine glaucous hue they require but little attention in comparison with those that have been potted late. If in frames, bricks ought to be put at each corner, raising the wood-work at least four inches from the ground, to secure good ventilation.

Ranunculus beds, which ought to have been prepared in autumn, may have a dressing of old cow manure and decayed leaves forked in lightly, preparatory to planting in February.

Examine *Pink* beds, and where the pipings have been raised by the frost or worms, they must be carefully fastened.

In bad weather labels ought to be made, handglasses mended, loaden layer pegs straightened, Carnation sticks made, &c.—*W. W.*

IV.—PINERIES, VINERIES, &c.

Pinery.—If the bottom-heat falls below 80° in the fruiting-pit, it should be revived by loosening the tan or leaves between the pots with a fork, and adding a few inches of fresh tan. If a stock of leaves have not already been collected, no time should be lost, when it is favourable weather, they should be collected into a heap and covered, so as to keep them dry. A supply of tan should always be in readiness, and kept dry. By keeping a supply of everything required in readiness, and in a fit state for use, the plants receive less check at the time of shifting.

Vinery.—In the earliest house, if the principal buds are broken, and showing fruit, let the heat by night be 60°, raising it to 70° or 75° by day, and by sun heat to 85°. Except in cases where wood is wanting, stop the shoots on which fruit is showing at one joint above the fruit. Rub off all useless shoots as they appear. Proceed gently with the Vines just breaking, taking care not to let the heat exceed 55° by night, until all the principal buds are broken, and keep the shoots always moist.

Peach-house.—From the time the blossoms begin to expand, avoid syringing till the fruit is set. During the time the trees are in bloom, maintain a steady heat of 57° by night, and admit fresh air every day if the weather will admit it. If the sun raises the thermometer as high as 75° with the sashes or ventilators open, it will assist the setting of the fruit.

Fig-house.—Now is a good time to commence forcing the Figs, as they continue bearing from the end of May till September or October; begin with a temperature of from 45° to 50° by night, with a moist atmosphere.

Strawberries.—Besides those recommended to be placed in a forcing-pit last week, it will be well to take some into a cool Vinery or Peach-house, and place them on the shelves or on the floor. They will be coming on to succeed those already in the pit, when the latter are removed to swell off their crop on the shelves of the Vinery.—*G. F.*

V.—HARDY FRUIT AND KITCHEN GARDEN.

Figs.—Should be protected, if not already done. The method most generally practicable is to unnail the trees, tie them closely together, wind a little straw among the branches, and cover neatly with mats. Pruning and nailing may be proceeded with in favourable weather, except in the case of Peaches and Apricots.

Filbert trees.—Regulate their heads and remove suckers.

Peas and Beans.—Defend forward crops from slugs, by quick lime and coal-ashes, or send a boy to strew tender leaves of Cabbage on the ground, and to examine them every morning. Protect intended crops from mice, by sowing chopped Furze along with them. The awns or chaff of Barley are useful for the same purpose.

Endive and Chicory.—The former may be blanched, and the latter grown and blanched beautifully, in any dark place commanding a temperature of from 50 to 55°.

Potatoes.—Be getting ready some fermenting materials for forwarding the earliest crops in pits or boxes. We have had young ones for some time, obtained from old tubers, placed in alternate layers with earth in a shed, in the end of August.

Mushroom Beds.—The principal things to be guarded against, (especially with out-door beds) are too much heat and too much wet. Where a constant supply all the year is wanted, a series of slight beds, rapidly succeeding each other, will answer the purpose better than one or two large ones. Horse droppings mixed with a good quantity of litter answer best for shelves, but when many are required it will not do to be very particular in choosing the material, provided it is capable of producing a mild heat, but we must regulate future operations according to the material. We will again advert to this subject.

Asparagus, Seakale, and Rhubarb.—See that beds producing do not get too hot after the late frost.—*R. F.*

VI.—ARBORICULTURE

Old Woods.—Continue the felling of trees not required for the bark. When Oak timber is required to endure for "ages to come" it is undoubtedly best to fell it in winter with the bark on, and before the trees begin naturally to decay. Resinous trees, for durability, should be felled just before the buds and leaves expand, when the sap is in motion. Fill up vacant spaces with young plants suitable to the soil, locality, and demand. Take great care to preserve any maiden plants of proper kinds springing up naturally, and let them be properly trained.

Coppice.—Proceed with cutting the undergrowth and poles, for the uses specified last week, and guard against a vigorous after-growth. Continue to clean out and make fresh drains where required; also, clean out old water-courses, and fill up open spaces with young plants suitable to the soil, locality, and demand for the produce; keep this circumstance always in view when planting for Coppice. The Prunus padus, Bird Cherry, or Hagberry of the North of England, is an excellent Coppice-wood for all the purposes of the Hazel; I am surprised it is not cultivated in the midland and southern counties. Defer planting in wet coppice till March or April.

Young Plantations.—Continue here the directions given last week. In thinning young plantations, where they have been planted promiscuously with various kinds of trees, leave them in irregular groups, or masses, either large or small, according to the extent of the plantations, each kind by themselves, as it will be seen about this time which plants thrive best in the different parts.

Hedge-rows.—Continue to plant young trees, and take care of those that have sprung up naturally there, as directed last week. Be sure to have good stocky plants for the purpose; not drawn-up, weak ones, out of the interior of close woods and crowded nurseries, but with plenty of side-branches to balance them. Avoid planting Ash in arable land.

Nursery Work.—Go on with the work specified last week, and in procuring seeds for sowing, and plants for planting out in rows for future use, get some of the Hagberry or Bird Cherry, if you can; it is easily raised by cuttings or layers, as well as seeds; it likes moist ground. It is not only valuable as a Coppice-wood, but very ornamental in hedges or woods. I am strongly of opinion it is a very valuable hard wood when it arrives at a good size, but my experience is not sufficient to speak with confidence to its quality as timber.—*W. B.*

VII.—COTTAGERS' GARDENS.

At this season, when there is little to be done in the way of cropping, everything around the cottage should be made clean and neat; all vegetable refuse may be collected into a heap, to rot for manure—nothing of this kind should be lost. Vacant ground, if any, may be turned up rough, to be fully exposed to the action of the weather; this is especially necessary for strong soils, in order that the frost may separate their parts and render them more friable. When manure is applied, a little at a time, and as often as an opportunity and the nature of the crops will allow, is better than when the ground is over-loaded with dung.

Vegetables.—If a sowing of Peas and Beans have not yet been made, no time should be lost in getting them in while the weather continues favourable.

Fruit.—Continue to prune any fruit-trees if not done last week, taking care, however, to keep the spurs short and close, otherwise they soon become long and give the trees an unsightly appearance.

Flowers.—Remove everything unsightly from the flower-plot. Nothing looks worse than to see decayed stems of plants standing at this season, as is too often the case. Bulbs, if any, that have made their appearance above ground, should be protected in the event of frosty weather, but not unless, as this has a tendency to make them weak and tender.—*Mc. H.*

State of the Weather near London for the week ending Jan 11, 1844, as observed at the Horticultural Garden, Chiswick.

Jan		Mean Age	Barometer Max.	Barometer Min.	Thermometer Max.	Thermometer Min.	Thermometer Mean	Wind.	Rain.

The highest temperature during the above period occurred on the 15th, 1834—thermometer 59°; and the lowest on the night of the 19th and morning of the 20th, 1838—thermometer 4½° below zero.

Notices to Correspondents.

MR. PAXTON'S COTTAGER'S CALENDAR.—At the earnest solicitation of many of our Subscribers, we have determined on again reprinting Mr. Paxton's "Cottager's Calendar," in the form of a small volume, for general distribution, price 3*d.* each copy. It may be ordered of all booksellers. Gentlemen wishing to *distribute copies* among their cottage tenantry, may have them *delivered in any part of London*, by remitting a post-office order to this office, at the rate of 5*s.* for every 25 copies.

COMMUNICATIONS from the following CORRESPONDENTS are in type, and are only waiting till room can be found for them:—*J. Parton, J. Snow, Herts, J. Wighton, C. G. Thompson, A Practical Man, P. Mackenzie, Tatty.*

BOOKS.—*A. Z.*—You will not get any good periodical on Gardening generally, with coloured plates, which costs less than 2*s.* a month.——*A. Subscriber.*—There is no book on the diseases of plants. We shall try to supply the deficiency.

CALCEOLARIAS.—*J. B.*—When you mention clay in the centre of your pots, and that you have kept your plants dry, you fully explain the history of your misfortunes. There is a good paper on the management of Calceolarias at p. 341, vol. 1841.

CAMELLIAS.—*E. B. W.*—Both the spotting and yellowness of your leaves, which nevertheless are very healthy, are owing to the action of strong light collected in a focus by some concave panes of glass in your roof. The whiteness found in leaves otherwise is usually owing to a cold wet bottom.

CACTUS SPECIOSISSIMUS.—*A Subscriber.*—The cause of your Cactus becoming discoloured and cankered, is, no doubt, owing to its being kept too cold and damp, as the plant has been kept in a greenhouse, where the temperature varies from 40° to 50°, and where plenty of air has been admitted; the dampness very probably arises from the atmosphere, the plants being otherwise kept almost dry. The disease is not at all infectious; the healthy plants likewise becoming infected, no doubt, is the result of the same cause. The fact of the disease attacking the most healthy branches is perfectly consistent, as they, being more succulent, would be readiest to suffer from dampness. The diseased parts may be cut off, and the plant should be placed in a warmer situation. To make the plant bloom freely, continue to withhold water until March or April, when the blossom buds will begin to appear; water may then be more liberally supplied.‡

CARROTS.—*Leeds.*—The White Carrot is not, in our opinion, so good for the table as the Red varieties.

CHRYSANTHEMUMS.—*A Waterford Subscriber.*—The kinds to select to save seed from are the semi-double varieties; they should be kept in a dry place, and have their heads preserved from damp. So much having been advanced in our columns respecting root pruning in former volumes, we are unwilling at present to resume the subject.‡

CUCUMBERS, &c.—*J. Hall.*—One of the best Melons is the Beechwood. There are now so many varieties of Cucumber, that it is difficult to say which is the best; possibly Weedon's "Black Spine" will suit you. The soil best adapted for growing them in is a very rich strong loam. A frame, covered with calico prepared with Whitney's composition, will answer very well for growing Cucumbers in during the summer time, but it is not possible to force them in such a frame.‡

FRUIT-TREES.—*A Subscriber.*—Your Apricot-trees, that have been planted 10 or 11 years, will be most likely brought into a bearing state by taking them up, trenching the border, mixing the soil with chopped turf if such can be obtained, and then replanting the trees, spreading the roots near the surface. A top-dressing of Lime will tend to prevent mildew, often the most formidable of all evils as regards the Apricot-tree.‡

FUCHSIA-SEED.—*A Reader, M.*—You may sow your Fuchsia-seed about the latter end of February or beginning of March; if it is sown sooner without the aid of a greenhouse, the young plants would be likely to damp off. The seed may be sown in pans filled with light sandy loam; if you have a gentle hotbed they might be placed on it; but they should be removed as soon as the seeds begin to germinate, as Fuchsias are rather impatient of artificial heat.‡

GREENHOUSE PLANTS.—*G. F.*—Probably your plants are undrained; examine the pots and see to the crocks. Probably the house is too damp, and wants ventilation. Kill the green-fly with gas-water as directed at p. 449 if they are hardwooded; or with tobacco-smoke if soft plants. The smoke of turf will do no harm, but it is better excluded from your greenhouses.

HEATING.—*Leeds.*—As your tenancy is short, it is not worth while to build brick pits; and, as a make-shift, you had better be satisfied with a common hot-bed.——*M. O. B.*—We see nothing to object to in your plan; but it is unnecessary to provide any means of giving a hotbed dry heat, because it is never required, unless you are going to grow bulbs of some sort in it.——*A Friend.*—We like your plan, and will have it engraved. It is always difficult to find a good boiler for a very little work. Perhaps a very nice boiler, by Burbidge and Healy, with an evaporating top, would be the best and cheapest under your circumstances. We should be tempted to try it.

INSECTS.—*G. S. T.*—The Coccus Vitis only affects the stem and branches of the Vine, and it may be eradicated by stripping off and burning the old bark in the winter, and washing the denuded parts with soap and water, or perhaps lime and water; but if the tortoise-bug give an unsightly appearance to the leaves and fruit, we conclude it must be a species with which we are unacquainted, and will thank our Correspondent to transmit some, per post, in a pill-box, together with an injured leaf or two, directed to Mr. Curtis. *R.*

LARCHES.—*J.* wishes to plant a small belt on a light poor soil on a chalky bottom—would Mr. Prideaux Selby recommend Larch or Beech as most likely to grow up quickly and repay itself?

LEMONS.—*G. F.*—Take your Lemons out of their tubs, shake off all the old soil, and repot them in coarse turfy loam, mixed with one-third charcoal, steeped in guano-water, or strong liquid manure of some sort. Give them plenty of pot-room, cut them in, start them in a good bottom-heat if you can, and they will soon lose their yellow looks. Manure cannot do them any good till they begin to grow.

MUSHROOMS.—Vide Calendar, Jan. 20 of the present year.

NAMES OF FRUIT.—*R. P.*—Your Pear is the Beurré Rance.

NAMES OF PLANTS.—*T. G., Clitheroe.*—The seeds appear to belong to some Asclepiadaceous plant.——*J. L. S.*—As your specimen is not in flower, it is hard to say whether it is Aristea pusilla or not; it probably is ——Δ. Flemingia strobilifera.——*J. M. K.*—Scolopendrium officinarum; not Kennedya at all; uncertain what.——*A. M.*—Barleria flava.

PEAS.—*J. P. S.*—Your Peas may be protected in the event of frosty weather with Spruce branches.‡

PELARGONIUMS.—*Jonathan.*—Your young plants of Pelargoniums in a pit, that are in a growing state and forming flower-buds, may be shifted now; they should not, however, be allowed to become too luxuriant at this season, or they will not stand covering in case of frost. The foliage should be kept as dry as possible, and everything avoided that would tend to create dampness.‡

PINES.—*Philonas.*—Your plants ought to have a bottom-heat of from 80° to 84°, with a top-heat in proportion, when fruiting. Read Mr. Glendinning's Treatise.

PORTABLE HOT-BED.—*G. W.*—This is not made in England, but may be had through the Paris Nurserymen. The account was taken from the "Revue Horticole."

POTATOES.—*Y. X.*—A good mealy Potato is the "Bread-fruit." A light rich soil will suit it best. The usual practice of placing the set upon the dung and then covering it in digging, produces the largest, but not the best-flavoured, Potatoes; they will be found drier and more floury if the dung is thoroughly mixed with the soil in digging, and the set simply planted in the furrow. A larger quantity of dung should, however, be put nearer the place which the row is to occupy than over the rest of the ground. The sets may be placed about nine inches apart in the row; the rows should be 20 inches distant, and the depth of the sets about seven inches.‡

RHODODENDRONS, MOSS-ROSES, AZALEAS, &c.—*W. R.*—You may easily have these in flower by the end of March, but much depends upon the means you use for forcing such plants; whether you use bottom-heat and a high temperature at top, or merely keep them in a warm greenhouse; about a month (at that season) will be about the time required to bring them into bloom. But you must remember that the slower you force such plants the better; they are particularly apt to flower when first put into the forcing-house.¶

ROSES.—*S. W.*—Subscription received. Answer next week.

SOIL.—*Leeds.*—The black mould from the heart of old trees would not be injurious to plants, but its advantage to them is uncertain: its action is something like that of finely-sifted peat.

SUGAR-CANE.—*M. D.*—There is no book such as you require, on the cultivation of the Sugar-cane. It must be remembered that Sugar is only one of the substances formed by the Cane, and the quantity which is formed will depend on the general health and vigour of the plant. When the Canes are manured you supply them with what is required by them, in the formation of several other substances besides sugar, and consequently increase the vigour of the plants. The ammonia and earthy phosphates in guano are useful to all crops when applied in proper proportions, particularly on poor soils; they render the plants more vigorous, and consequently increase the formation of gum, sugar, starch, gluten, etc. *E.*

TANK-HEATING.—*Amateur.*—We think we have not expressed any positive opinion that brick and cement tanks would prove too damp for greenhouses; we have only said that we fear they may prove so. If the body of the tank were sunk so low that the top, which is covered with slate or flags, is just level with the floor of the greenhouse, the liability to dampness (which chiefly penetrates through the sides) would, no doubt, be diminished; but then the tank would not give out the same heat to the house as if the sides were raised a foot or so above the level of the floor, as is usually the case: a great part of the heat that radiates from the sides would be absorbed by the floor. It is true, that in tanks the hottest current of water always floats to the top, and no doubt, therefore, the greater portion of heat escapes from the surface of the covering of the tank; nevertheless, by degrees, the water all becomes warm, and then heat will pass through the sides.

MISCELLANEOUS.—*J. J.*—If you will send us a specimen of the substance you call the Star-shot we will endeavour to tell you what it is.——*Mentor.*—To comply with your suggestion would be to extend these notices to a most inconvenient length; we often, indeed, fear already that our readers are weary of them. Besides it would not be worth while, except in special cases, and then we do it as part of our system, if we can find room. The same reason, namely, the inconvenience of letting them occupy more space, prevents our putting them in larger type.——*Ruricola.*—The canker in Cucumbers is produced by cold either at the bottom or top, or both. Mildew is owing to sudden chills and a low temperature. The most useful green-fleshed Melon is the Beechwood. For the manner of dealing with Thrips, see p. 619, 1843.——*Jas. Drummond.*—We should be glad to receive the notices you speak of; and perhaps the matter already printed may be used again.——*R. P.*—We find nothing in your paper of importance enough to publish it.——*Zeta.*—The *last edition* of Dr. Lindley's "Theory of Horticulture" was published in 1840.——*A. L.*—Don't you know the husks of Maize when you see them? they are what form the packing of the Orange chests opened in Covent Garden Market.

*** As usual many communications have been received too late for answering this week.

DRAINING.—JOHN DAVIS, Mathematical Instrument Maker, Derby, begs to direct the attention of Agriculturists to a very efficient and simple Level he has just constructed, adapted especially for Draining. The private Farmer or the professional Draiuer will alike find in it all that is desired. The Instrument is fitted in a case, and sent to any part of the country for 3l. 3s.

SLATE WORKS, ISLEWORTH, MIDDLESEX.

EDWARD BECK informs Horticulturists generally that the Cisterns, Tanks, Shelves, Stages, Conservatory Plant-boxes, Edgings for Garden paths, &c., manufactured by him in Slate, may be seen in use at Worton Cottage, upon Application to the Gardener (Sundays excepted).

The Agricultural Gazette.

SATURDAY, JANUARY 13, 1844.

WITHIN the last few years, many experiments have been performed on the subject of the SHEDDING OF SHEEP, and their results have been so successful, that on some farms this way of managing the fatting sheep stock is now generally adopted.

Mr. Childers was among the first to direct attention to this subject. He has published the results of his experience in Vol. i., Part 2., of the English Agricultural Society's Journal. It is there stated that two lots, twenty in each, of Leicester wether hogs were selected, as similar in quality as possible. One lot was placed under shelter in a yard, and the other was folded in the field. They received the same kind of food, viz., cut Turnips *ad libitum*, half-a-pound of Linseed-cake, half-a-pint of Barley per sheep per day, a little hay, and a constant supply of salt. At first they consumed nearly the same quantities of food, eating each day about 19 lbs. of Turnips per sheep; but, after the third week, "there was a falling off in the consumption of the hogs in the shed of 3 stone of Turnips a-day," *i. e.*, 2 lbs. apiece; "and in the ninth week there was a falling off of 2 stone more. Of Linseed-cake there was also a falling off of 3 lbs. a-day," *i. e.*, nearly one-third of the quantity given. "The hogs in the field consumed the same quantity of food from first to last.

"The result of the experiment is as follows:—

20 Shed Hogs weighed	Increase.	20 Field Hogs weighed	Increase.
	st. lbs.		st. lbs.
January 1st . 183 3	—	184 4	—
February 1st . 205 0	21 11	199 8	15 4
March 1st . . 215 10	10 10	208 2	8 8
April 1st . . . 239 9	23 13	220 12	12 10
Total Increase . . .	56 6	—	36 8

Consequently, the sheep in the shed, though they consumed nearly one-fifth less food, made above one-third greater progress." This result is confirmed by our own experience. Of three lots of sheep, one entirely covered in, another under a shed in the yard, and the third entirely exposed, all of them having one pint of Oats per sheep per diem, the first consumed, on an average, between Nov. 18, 1842, and March 9, 1843, 8 lbs. of cut Turnips and other roots per diem, and increased in live weight during that time 23½ lbs. per sheep; the second consumed 11 lbs. of the same food, and increased 25 lbs. in weight; the third consumed 17 lbs. of cut Turnips, &c. apiece each day, and increased in live weight 23 lbs. during the period. The several lots, it thus appears, did not differ so much in their growth as in the case reported by Mr. Childers, but there was a much greater difference in the quantity of food eaten by them; so great a difference, indeed, that were this result to be generally expected from a similar treatment, which, however, we by no means wish to infer, twice as many sheep might be kept in a fatting condition on the same quantity of food under perfect shelter, as under entire exposure.

We notice this subject now, as it is one to which the attention of the farmer may be usefully directed at the present time of the year.

In exposed situations, during wintry weather, sheep on Turnips do not increase in weight—they often lose, as the experience of many can testify; and if the expense of carting the roots home and the manure back to the land, which is involved in the plan of house-feeding, be balanced by the additional value of the manure so obtained, as it probably is when the field is not very distant, then a saving of food and an increase in the production of mutton is the clear difference between shed-feeding and folding of sheep, in favour of the former. But there may be other differences between the two plans, as in point of healthfulness, &c., and to these we shall hereafter allude; meanwhile we may describe a very cheap and easily-erected form of shed with yard attached, which may be put up in the field, and thus very much reduce the expense of carting. The annexed woodcut is taken from part of a shed now in use containing 200 sheep. The cost of erecting the framework was 10*s.* per 100 feet in length, and the thatch, which in this case was reed from a neighbouring pond, was laid on and tied down by two men in half a day; the labour of erecting 100 feet of shed sufficient for sheltering 100 sheep thus costing 12*s.* in all. To this must be added the cost of the materials of its construction, viz.:—

	£	s.	d.
100 Larch poles about 12 feet long . . .	—	—	—
6 dozen hurdles for the yards (see woodcut) .	—	—	—
	£—	—	—

These materials will last several years, and they may be taken apart out of the way at spring, and put up again every autumn at a cost of little more than one penny for each sheep to be sheltered by it. No charge is made for straw for thatch; it is the produce of the farm, and returns to the land, as it would were it used otherwise. The mode of erection is this:—Two Larch poles about 12 feet long, and crossing at their extremities, where they are nailed together, are thrust firmly into the ground at a distance of 15 feet; they thus form one with another rather more than a right angle (see Fig. 2).

A series of such couples arranged, as in fig. 1, at distances of 10 feet, form the skeleton of the future roof. A ridge pole is then placed so as to connect these couples; it lies in the forks made by their extremities crossing, and is nailed there. Four other side-pieces parallel to this, the lowest one being placed so far down the couples as to be within the height of a hurdle from the ground, are then nailed on each side, and the skeleton roof is completed. The thatch is now merely *laid on*, and two other poles, (see fig. 1), being laid above it, and tied through the thatch to the couples below it, hold it fast. Hurdles are now placed around and within, so as to form a series of little yards, 10 feet wide by 25 feet in length, of which nine are under the roof, and these being littered with straw are ready for the reception of 10 sheep a-piece. The outside hurdles should be wattled, so as to afford more shelter. The subjoined wood-cut represents one part of the shed completed, and the other part in its skeleton state.

Fig. 1.

Fig. 2.

LET us take up another of the subjects suggested by the Prospectus of this Paper.

"No one man can be competent to deal with the multifarious questions affecting Husbandry, and the duty of the Editor of such a Paper as the *Agricultural Gazette* is to make known the knowledge of all. It is to practical farmers that the Proprietors trust for the means of carrying out their views, and not to the talents of any individual."

We are anxious to impress upon our readers the importance of a *widely-spread* Agricultural correspondence.

The many natural and other agents which affect the farmer vary, both in quantity and in kind, in the different districts of our country, to such an extent that the argument of any one who reasons merely from what he sees around him is rarely applicable to any other than his own immediate neighbourhood; so that a "Code of Agriculture" of universal application could be compiled only by a company of men, among whom every district of the kingdom should find its representative. Hence it appears to us, that a body of statements, each accompanied by the conditions under which it is correct, such as from a widely-extended system of Agricultural correspondence would ultimately accumulate, is the only source from which *any one* might, without fear, draw information for his own guidance as a farmer.

The produce of the land depends on four things: viz., the character of the soil, the nature of the climate, the skill and judgment of the farmer, and the amount per acre of his invested capital; of all of which it may be said, not only that the kingdom generally contains them in most various degrees, but that a district of only a few square miles cannot be named over which one of them is constant. And, obviously, that which is the best system of management, under one condition of these important agents, is not necessarily the best under any other condition; the same skill and sound judgment on the part of the farmer, which would sanction one mode of farming under one series of circumstances, would approve of another altogether different when those circumstances had changed. Many systems of farming may thus exist in a country, and do exist in this one, each very different from the others, and yet each justified by the circumstances under which it is placed. And the opinions of any Agricultural correspondent, however safely built upon facts, are not necessarily of general application, because that which is fact in his neighbourhood may not be fact elsewhere. Hence the importance—and, indeed, to an Agricultural Journal, aiming at usefulness, the necessity—of having a numerous staff of intelligent and practical correspondents widely spread over the kingdom.

And here, by the way, we may remark that it is a very common practice to compare, or rather to contrast, the farming of certain distinguished districts in the East and North of England, and in Scotland, with that of certain other districts in the South and West of the kingdom; but, though in such comparisons the results of farming may be accurately stated, yet it is manifest that no inference can justly be drawn from them as to the skill of the farmer, unless, at the same time, all that light be thrown on the question which would be afforded by a description of the soil and of the climate, and by a statement of the farming capital invested. So entirely, indeed, does the question—what is good farming depend for its answer upon these three circumstances, that we believe it will be found that the plan of farming which long experience has sanctioned in any district, however bad it may appear to others, is generally justified by the circumstances of the case. And, in saying this, we are quoting the opinion of Mr. Smith, of Deanston, who, perhaps, more than any other, struck boldly out from the beaten path when he commenced farming. Let us not, however, be understood to recommend that, in such districts, the mode of farming should remain unaltered, justified though it may thus be. Its faults may be remedied, and Mr. Smith's example may safely be followed, if the obstacles to improvement be first removed. The texture of a soil, its dependence upon a variable climate, and the amount per acre of the tenant's capital, are, to a great extent, all under control. The last depends, of course, upon the extent of the holdings; and the two former depend greatly upon the wetness of the soil, which may be removed by drainage. And when a farm has been improved in all these particulars, the same sound judgment which was before fearful of changing the mode of its cultivation will now recommend the adoption of another and superior plan. All that we wished to infer was, that a full statement of the Agricultural statistics of the districts referred to would put a stop to many of those comparisons which are drawn between them in order to prove want of skill against the farmers of some of them; for it would show that the differences in their Agriculture are often owing to the peculiar circumstances in which each is placed; and this would be beneficial, for it would tend to remove prejudices and jealousies from between those who, mutual interest certainly says, ought to be none other than good friends.

We hope, therefore, that our readers, in their correspondence with us, and with one another through us, upon the activity and practical nature of which we hang all our hopes of usefulness, will not only state their opinions, but the facts which justify them; and not only the facts, but the circumstances under which they have occurred.

There are many subjects upon which light would be thrown by an accumulated correspondence conducted thus. The differences existing between many districts

of the kingdom, as regards the results of farming, would receive their explanation, and such an explanation, probably, as, if acted upon, would greatly increase the Agricultural produce of the kingdom. The extent and nature of the influence exerted by climate, and by the other agents which affect farmers generally, would also be pointed out. And here we may express our satisfaction at seeing that the English Agricultural Society has offered a premium for the best Essay upon 'The Influence of Climate on Agriculture.' A detailed and statistical statement upon this subject would be a most valuable guide for—and, as we have already stated, a most useful restraint upon—future Agricultural writers.

We conclude, with the hope that, during the perusal of this article, our readers have kept in view, and self-applied the inference from our remarks, which we again repeat: It is essential to the usefulness of any Agricultural periodical, which is intended, not for local, but for general circulation, that it be supported by a widely spread correspondence among practical men; it is essential to the usefulness of any such correspondence that it should not only embody facts, but state the circumstances also under which these facts occurred.

CULTIVATION OF ITALIAN RYE-GRASS, AND MODE OF CROPPING A STRONG CLAY FARM.

HAVING grown Italian Rye-Grass extensively and regularly upon different kinds of soil for many years, I am not incompetent to furnish some particulars respecting it, which may be of general utility.

The soils best adapted for it are deep alluvial and strong loams, and it succeeds well upon most descriptions of land. On those, however, which are light or stony, especially if upon Oolite, Chalk, or Limestone, and on any well adapted for the growth of Sainfoin, the crops of Wheat, after Italian Rye-Grass, are frequently defective, which probably might not be the case were the surface skimmed off by an extra share when ploughing the land; but it is not advisable to sow any considerable quantity of such land with Wheat after this Grass.

The produce is usually greater than that from any other description of artificial Grass, and the quality of the food is excellent for all kinds of stock; they prefer it to almost any other pasturage. When the seed is sown with spring Corn, the land should be stocked immediately after harvest, and the produce eaten off closely before November, avoiding treading tenacious soils in wet seasons. Very early in spring, the growth, after such treatment, if the land be in proper condition, is surprisingly rapid, so that those who have a crop of Italian Rye-Grass in their regular rotation of cropping always possess good and abundant keep for sheep after their Turnips are consumed, that being generally the most trying season for breeding and store stock. The produce should be well eaten off within a few weeks, and the land should be without stock for about the same time, alternating in this way during the spring, summer, and autumn. By such treatment, two fields of Italian Rye-Grass (one of the first and the other of the second year) will keep a much greater number of cattle and sheep, and in better condition, than the same quantity of land producing any other artificial Grass of the first and second year. It should never, when pastured, be suffered to run into seed, that being most injurious both to the quality of the produce and to the land also.

When intended to be mown, Italian Rye-Grass should be well eaten off after the preceding harvest, and not stocked in spring. The seed should be ripe when the crop is cut, and it should be taken up into sheaves immediately after the scythe, and set up ten or twelve together until sufficiently dry for being clean threshed. This should be done on a cloth in the field, with flails, or the heaviest and most valuable part of the seed would be lost. It should be put into sacks, carried into a barn and riddled, and spread and turned frequently, until perfectly dry, and should then be winnowed with a gentle blast, by which means the seed is of more than double the value of what is often sold; and with such treatment the produce has averaged more than four quarters per acre, and of the weight of about 10 stones per quarter. Half the quantity of this, that is requisite of foreign (or of ordinary English) seed weighing less than 7 stones per quarter, will yield greater produce. At the time of threshing, the crop should be spread and turned; and when stacked in good condition, it makes nutritious fodder, which is eaten by horses and cattle greedily.

When artificial Grasses or Clovers have failed from drought, or from abundant crops of Corn, they may always be most effectually renewed by sowing Italian Rye-Grass, which is very hardy, on the failing portions of a field after the first rain succeeding harvest; and this is a material advantage, as it insures a regular rotation of crops.

The following is the present state of this farm, with reference to Italian Rye-Grass and the crops succeeding it, the land being a strong loam upon tenacious clay, well underdrained with tiles. Three fields are regularly fallowed yearly after Wheat, well manured, and sown with Swedes or Turnips, the chief part of which are carted off for being consumed in fold-yards, and thus an unusual quantity of most valuable manure is made, both solid and liquid.

One field was sown with an imperial bushel of Italian Rye-Grass, 10 lbs. of white Clover, and 1 lb. of Parsley per acre, along with Barley, last spring, and will be pastured next year.

One field was sown as above, to be mown next year for seed and fodder, and after being manured according to usual practice, it will produce valuable after-math.

One field was sown with 10 lbs. of red Clover, a peck of Italian Rye-Grass, and 1 lb. of Parsley, for mowing for horses and cattle, and the second crop principally for sheep.

One field of Italian Rye-Grass and white Clover, after being pastured one year, remains for second year's pasture.

One field of Italian Rye-Grass and white Clover, after being mown for seed and fodder last year, and the after-math grazed, remains for second year's pasture.

Two fields of Italian Rye-Grass, one having been pastured two years, and the other having been pastured since the crop of seed and fodder in 1842, will soon be ploughed deep, and with a skim-share for Oats.

Two fields which produced Oats last year after Italian Rye-Grass, and one field which was sown with red Clover, and Italian Rye-Grass last year are now growing Wheat.

Three fields, now Swedes and Turnips, will be sown with Barley, Italian Rye-Grass, and Clovers, in spring.

The whole of the above have now a good appearance, and the same system has been practised for several years with increasing advantage.

The arable land of the farm consists of 16 fields as above: viz., two courses of six and one of four in alternate rotation, and the same field is sown with Red Clover, for being mown, only once in 16 years. I also grow Italian Rye-Grass, with white Clover for pasture, and with red Clover for being mown, on two other farms regularly, and have long ceased to sow any other variety of Rye-Grass.

Objections have been made to Italian Rye Grass besides that mentioned at first, it being alleged that the land, after the succeeding crop of Corn, is frequently foul with Couch and other inferior Grasses; this is the natural result when genuine seed has not been sown, or when the land has not been properly cleansed. My land, after the first and second crops immediately succeeding Italian Rye-Grass, is generally as clean as though the crop had been sown after fallow; and I have never failed of having abundant crops of Corn, and these of good quality, after Italian Rye-Grass. I shall be happy to show my crops to any of your readers, or to give further particulars with reference to this communication.—*John Parkinson, Ley Fields, Newark, Notts.*

AGRICULTURAL EXPERIMENTS.

(Continued from p. 11).

Erratum, p. 11, col. *a*, line 21, from the bottom, *for* 106*l.* 15*s.* 10*d*, *read* 6*l.* 15*s.* 10*d.*

I NOW proceed to describe some experiments upon Corn, which, however, were not of a decisive character, for they were tried either only in single proportions or on different soils, and therefore, though the results are extremely discouraging, it does not follow that the manures are bad and not worth further trial. Other proportions, or, indeed, the same, under other circumstances, may still be found advantageous. The mode in which these results were ascertained was as follows:—six perches of land were selected from each manured portion, and the produce both of Straw and Corn was carefully measured and weighed, and from these data compared with the produce of an unmanured adjoining portion of equal extent; the profit and loss per acre was computed, after deducting the cost of the manure. It is necessary to enter into these minute details, for the purpose of showing what reliance may be placed upon the accuracy of the experiments. One conclusion, at least, may be safely drawn from those experiments, and that is, that in Agriculture, as in all other natural sciences, some phenomena will occur which we must be content not to understand. Accurate analysis, perhaps, might assist in solving the problem, why the same quantities of the same manure applied to similar soils under similar circumstances shou'd produce such very dissimilar effects; but for that purpose the soils must be analysed at the time of sowing, for their constitution will be inevitably changed by the growth of the crop, and by the accidents of cultivation. And on general principles it would be hard to account for the Guano being more beneficial to a more fertile soil, than to one that is less fertile, and harder still to say why, when 3cwt. increases the produce of Corn by four bushels, 2cwt. diminishes it by more than half that amount. Nitrate of soda presents another instance of irregular action, for 1cwt. seems to have injured the crop; less Corn grew where it was used, and much less straw; but when one-fourth more was added the injury was not increased, but the produce was in a remarkable degree; amounting to 8 bushels of Corn and 23 trusses of straw more than on the unmanured part of the same field; the quality of the land, however, was very inferior to that on which the other experiment was tried. Sulphate of ammonia, the only other manure that repaid its cost, exhibited no such anomalies; it is true it was tried in only one proportion on two sorts of Corn, but in both instances a small quantity produced good effects, especially upon the Barley, and better may be anticipated from larger measures of it, for some experiments which I have tried on a smaller scale, for the purpose of testing more accurately the power of the manure, seem to show that when applied to Corn its success is—not as on grass—nearly in an inverse ratio to the quantity employed, but in some proportion to the increase of quantity—not, indeed, in any definite proportion, but so that the increase of produce is on an ascending scale. Three small portions of spring-sown Wheat were watered with a solution of 1 lb. of sulphate of ammonia in 8 gallons of water, which is at the rate of much more than 60 lbs. to the acre. The first was watered once, the second twice, the third three times, with an interval of about 10 days between each watering. It was intended to give additional doses to the remainder, but the Corn grew so rank, that it was feared it would die of plethora, and the thickness of the herbage intercepting the liquid intended for the roots, it began to grow rusty, and the deep green verdure being disfigured with brown spots, it seemed to be a complete failure. Nevertheless, the ears shot up vigorously, and were not laid like some of the adjoining corn by heavy thunder-showers, and at harvest 12 ears being taken from one end of each row, the Wheat they contained was weighed, and the results were as follows:—

Watered once the weight was	.	686 grains.
,, twice ,,	. .	1330 ,,
,, thrice ,,	. .	1438 ,,

In the first case the average number of stalks upon each root was six; in the others, eight. Compared with the unmanured, a bushel of it would weigh about 1 lb. more. A similar ascending scale of value is more strikingly exemplified in some experiments on Indian Corn. In all of them several of the ears were very defective, and not half clothed with grain. It is, therefore, as in the last instance, not to the positive quantities that I wish to call your attention, but to their relative productiveness, as compared one with another.

These experiments supply no evidence of the maximum that may be used with advantage, and for their better confirmation they ought to be repeated and varied and tried in other seasons and on other soils; but upon the whole there is reason to conclude that this will be one of the most valuable among the artificial manures; and if any reliance can be placed upon Liebig's discoveries, that is no more than may be reasonably expected from a salt combining in itself two such important ingredients in the vegetable economy as sulphur and ammonia.—*L. Vernon Harcourt.*

ON MINERAL & INORGANIC MANURES.—No. II.

BY PROFESSOR CHARLES SPRENGEL.

(Translated from the German.)

So many proofs can be adduced for the assertion that the success of plants depends chiefly on the mineral substances of the soil, that it is only prejudice which can make us for a moment doubt of it. I will state some of the arguments in favour of my assertion. In all (or, at least, most) plants belonging to the tribe of Clovers we find a great amount of phosphoric and sulphuric acid, chlorine, soda, potash, lime, and magnesia; and we know well that they will only succeed when the furrow-slice and the subsoil abound in these substances. Red Clover is often very difficult to be reared, but succeeds at once if the soil be manured with marl. If we examine the latter, we shall find that it either contains all the mineral substances required for the growth of Clover, or that it contains those in which the soil was deficient, and for the want of which Clover could not succeed. If Flax be submitted to chemical analysis, we find that it contains much magnesia; and if we plant it in a soil which is deficient in this mineral substance, it will either not succeed at all, or turn out so badly, as scarcely to pay the expense of seed and labour. After the same soil has been manured with marl, the Flax in most cases will perfectly succeed; and if we subject the marl to chemical analysis, we shall find it to be a sort which is most conspicuous for its great amount of magnesia. A manure of wood-ashes will at once elicit on all sour meadows, covered with moss, a variety of Clover and Vetches, and although the ashes may not contain nearly so much potash and lime as to neutralise even the twentieth part of the acid contained in the soil, the above plants will still grow most luxu-

rtantly, for the ashes will supply them with the mineral substances they want, which the soil does not contain, viz., gypsum, phosphate of lime, potash, common salt, and magnesia. Oats contain more potash than all other Cereals, and thus we see that they will succeed after a manure of either fresh or even extracted wood-ashes, which latter generally contain a good deal of potash, or at least silicate of potash. Rape is very rich in potash, soda, chlorine, and sulphuric and phosphoric acids, on which account it requires a plentiful supply of good dung, which contains a greater amount of these substances than most of the mineral manures. It is, however, also improved by a simultaneous manure of marl (as shown by every day's experience), by which it appears the more clear, that the dung does not entirely supply its want of mineral substances. Dung will supply Rape abundantly with nitrogen, which this plant is so much in need of, but even this can be effected by some mineral substances, viz., by any of the nitric or ammoniacal salts, as proved to me by experiment. Beech-trees will not succeed in sandy soils, whilst Pine will succeed there very well, and for this reason; the former tree contains much potash, soda, magnesia, &c., substances which therefore are required for its growth; whilst Firs require but very little of these substances, and consequently will succeed in sandy soils, which in the main do not possess these mineral substances to any considerable amount. The Fumitory (Fumaria) contains a great deal of potash, on which account we always find this shallow-rooted plant in localities whose surface is rich in that substance. The Nettle, the Mugwort, Colt's-foot, the Thistle, and the Burr, are also rich in potash, but their roots penetrate deep into the soil, and thus we find them in places where the subsoil contains much potash. The so-called Salt plants, (Salicornia, Salsola, &c.) succeed only in soils superabundantly rich in common salt, and we find in them a greater amount of potash than in any other plants. The Rush (Juncus), appears always in a soil rich in potash and manganese, and it is a proof of its requiring much of these substances for its nourishment, that they enter largely into its chemical composition. The chemical analysis of the Lupine has convinced me that it contains much iron and phosphoric acid, and I find also that it succeeds best in localities whose subsoil is rich in these mineral substances. If we manure a sour moorland with a mixture of sulphate of potash, gypsum, phosphate of lime, and magnesia, common salt and fine quartz gravel—(substances which do not neutralise the acidity of the soil), we shall find that the plants afterwards grown on it will prosper, and this proves that these are the mineral substances which nourish the plants, and we shall also find these substances entering into their chemical composition. If mineral substances acted merely as solvents of the humus, or merely as stimulants of the vegetative process, they would be equally useful to all plants; but the contrary is the fact; gypsum, for instance, will improve Leguminous plants, whilst nitric salts will have no effect at all on them. The above examples, and many others which I could cite, prove, I think, most evidently, that besides carbon, hydrogen, oxygen, and nitrogen, mineral substances also are required for the growth of plants.

The following general remarks are yet to be added, relating to the manuring with mineral substances. Every mineral substance which is contained in a plant is necessary as a manure for that plant, in so far, namely, as it is not contained in the soil in a sufficient quantity. No mineral substance, however, is required by plants in large quantity; and because only a very small quantity is found in some of them, the opinion has arisen that they are but adventitious ingredients, not essential component parts of plants. One of the reasons why the application of mineral substances has not produced the expected result, is, that sufficient notice has not been taken that plants do not require, nay, cannot bear, a large quantity of some mineral substances. If, for instance, a mineral substance is very easily soluble in water, 10 or 15 lbs. per acre more of it than is necessary will produce an unsatisfactory result, as the plants will then be compelled to receive more than they are in need of. On the other hand, mineral substances which are soluble in water with great difficulty may, without danger, be used in greater quantities, if they produce the desired effect. If, therefore, we wish that mineral substances shall act beneficially as a manure, the degree of their solubility in water is especially to be taken notice of. If, moreover, mineral substances are to be useful, it is also always necessary that the soil be not deficient in humic acid, because the latter has not only to act as the transferring medium of mineral substances into the plants, but it is also from it that plants have to obtain the carbon, which (as far as weight is concerned) is always the chief component of plants.

(*To be continued.*)

ON THE APPLICATION OF CHEMISTRY TO AGRICULTURE UPON RATIONAL PRINCIPLES.—No. I.

Every human being is directly or indirectly dependent upon the vegetable world for the food necessary to support life.

The universality of this important fact places Agriculture among the highest of useful sciences, and the influence it exercises over the welfare and happiness of mankind is the result of its paramount necessity.

In a primitive state of nature, a bountiful and all-wise Providence has abundantly supplied every living thing with the means of subsistence. Civilisation and its attendant luxuries, and the rapid increase of population, have created more wants among mankind; and hence the necessity for increasing our means of obtaining food—among which the application of Chemistry to Agriculture has in modern days excited considerable attention.

By Agricultural Chemistry is meant—Firstly, The Chemical analysis of soils; by which the elements from which plants derive their means of growth and supporting life may be, so far as the soil is concerned, clearly defined and understood.

Secondly, The chemical constitution of plants; by which correct notions of the adaptation of the soil to the plant may be founded.

Thirdly, The chemical examination of manures, or the food of plants; by which a correct system of their application to the known condition of the soil and the known constitution of the plant may be established, and also the best means of retaining or increasing their fertilising principles.

In the following papers I propose to examine these three heads separately, pointing out, in the most intelligible manner I can, the means by which the farmer can successfully apply chemical principles to the practice of Agriculture.

Part I.—Of the Chemical Analysis of Soils.

There can be no doubt that a knowledge of the chemical constituents of soils is a most important preliminary inquiry in the science of Agriculture. The common division of soils into "light," "heavy," "sandy," &c.—a division based upon the practical knowledge of the farmer—is sufficient for ordinary purposes, but a more exact and intimate examination is necessary for the application of Chemistry. There are degrees in each of these divisions which must necessarily escape the most acute observation, and analysis can alone afford the information necessary to found a system of scientific Agriculture.

I have reason to believe that one of the most serious obstacles to the farmer in entering upon this inquiry is that which is presented to him in the outset, in the difficulties he encounters in gaining a correct chemical knowledge of his soils. I hope to show that this difficulty is more imaginary than real, and that much very valuable information may be obtained without any knowledge of Chemistry whatever, by the mere exercise of ordinary tact and a little extraordinary patience and perseverance.

Sir Humphrey Davy more than 30 years ago, in his admirable work upon Agricultural Chemistry, pointed out how this could be done. Within the last few years, what is called Organic Chemistry, or the analysis of vegetable or animal structure, has made rapid strides in the march of improvement; and hence the more easy application of chemical science to that of Agriculture. But it is erroneous to suppose that it is necessary for the farmer to have an intimate acquaintance with Chemistry; and much difficulty has been raised in making him believe the results of science, from an impression of this kind. The knowledge he requires is the means of applying the discoveries of others to the improvement of his system of farming. The chemist can explain to the farmer, that certain plants require certain food, and although the statement of the chemist is founded upon his knowledge of the ultimate elementary structure of both, it does not follow that it should be necessary for the farmer to undertake the analysis of Wheat or stable manure. He may be taught how to fix ammonia without entering into abstruse detail or discussing difficult problems in a science of acknowledged difficulty.

The inquiries of the chemist render a perfect knowledge of the science necessary; but while he is instituting lengthened analyses in his laboratory, and deducing important truths from them in his study, it is as well that the farmer should be testing the correctness of his inferences by subjecting them to the test of careful, of sound, and useful experiments.

All soils are divisible by a very simple process into three principal parts.

The first contains coarse gravel and sand (generally composed of flint and chalk), and undecomposed vegetable fibre.

The second of fine sand, called by chemists, silex.

The third of a fine powder, called by Sir H. Davy, "impalpable matter," and which generally consists of the following substances, in variable proportion.

Firstly. Aluminous earth; the principle which gives to clay its peculiar character, and upon which its value in making earthenware depends.

Secondly. Decayed vegetable matter, which is known by the term humus. This principle generates an acid termed humic acid, by its union with oxygen; and this acid again unites with lime and other earths, forming what are termed humates.

These humates are very insoluble, but they perform an important purpose in vegetation, by their decomposition setting free the carbon of the humus, which is one of the elements in the food of plants.

Thirdly. Silica, which is an earthy substance, formed by the union of an elementary principle, called Silicon, with oxygen. In its pure form it is known as quartz rock. The difference between the silica of the impalpable matter and the silex, or sand, above mentioned, is simply that the one is crystallised in the form of minute grain or sand, and the other is what is termed amorphous, or uncrystallised.

The same substance frequently occurs in Chemistry under different forms, for the obvious reason (as in the above case) of being more easily appropriated by the roots in the organisation of the fabric of the plant. United with the alkali and potash, silica forms the substance upon which the stiffness and brittleness of the stalks of Corn and other grasses depend. It is from the union of these materials, also, that the well-known substance—glass, is manufactured.

Fourthly. Various salts; of which carbonate of lime (chalk), carbonate of magnesia, muriate of soda (common salt), carbonate of potash or soda, and sulphate of lime (gypsum), are the most frequent.

These ingredients are all of them more or less discovered in plants, in which they perform important purposes in the nutrition of animals that feed upon them. Thus chalk is necessary to form bone; soda and potash, bile; muriate of soda, milk.

Fifthly. Most soils contain animal matter which nourishes the plant; and

Sixthly. A variable proportion of the oxide of iron, which is an essential element in the blood of animals.—*C. R. Bree, Stowmarket.*

Home Correspondence.

Leases.—Give to the farmer who has sufficient capital a certain term of interest in the soil which he cultivates, and then he will not only be justified in laying out his capital in its improvement, but he will exert all his energy in increasing its productiveness so as to insure the greatest return to him for his outlay. The length of term to be given should be dependent upon the extent of the improvements which the land requires. When land is let for building on, a term of 60, 80, or 90 years is granted, to indemnify the speculator for the expenses of bricks and mortar, and the risk he is subject to; just so should it be with the farmer. When there are expensive improvements and risk to be sustained; if the land is wet and has to be thoroughly drained, &c.; if the nature of the soil requires to be altered so as permanently to improve its texture; if roads have to be made; if additional buildings for the necessary accommodation of stock to consume the increased produce require to be erected; if foreign manures be required, and a new and more perfect mode of culture be necessary, such a length of lease, according to the peculiar circumstances of the farm, should be granted, as will induce an enterprising tenant to embark his capital in the permanent improvement of the stock.—*J. J.*

Mode of Planting Wheat.—I quite agree with the statement Mr. Morton gave in your last, of the advantage to the Wheat crop of thin and regular sowing. Plants that are put into the ground at equal distances produce a more uniform and a greater crop than when they are planted irregularly. Wheat will yield more if drilled than if sown broad-cast, and more when dibbled than if drilled. No kind of seed which the farmer uses should be planted more than two inches deep. Perhaps one inch is better than two, when the soil is stiff and clayey. The lighter the soil is, the deeper we may plant our seed.—*T. C. M.*

Agricultural Education.—There has been for several years a general opinion expressed that a knowledge of the sciences should be combined with agriculture, and that the practical farmer, by possessing a complete knowledge of all the sciences, bearing either directly or indirectly on his business, would be a much more effective agriculturist both for himself and for the community at large; that, bringing a greater amount of knowledge to bear on all his operations, he would obtain a greater return from his capital employed. It is also generally lamented that the means of acquiring scientific agricultural knowledge are not more generally within the reach of every man who intends to give himself up to an agricultural life. Most farmers, however, think that they themselves can give their sons all the agricultural education that is necessary to make them able to earn a livelihood; and, therefore, though they may have the means of acquiring a knowledge of the sciences which tend to illustrate the phenomena exhibited by nature in their business, it is more than probable that not one in a thousand of the farmers' sons of the present day would be sent to receive the scientific instruction if it cost them but a mere trifle. People must first feel their wants before they can be anxious to go out of their beaten track to get them supplied.—*A Farmer's Son.*

Varieties of Wheat.—The relative value of the several varieties of Wheat, as well as of all other plants which the farmer cultivates, ought to be carefully attended to. There is no doubt but vegetables, like animals, will only and always reproduce their varieties, and therefore the farmer should be as careful in selecting his seed Wheat, &c., as he is in selecting his sheep or stock to breed from. The largest and best grain will produce larger and better grain than the seed taken from smaller grain, the produce of an inferior crop; this is on the principle which we believe to be undeviating in nature, that all things reproduce their kind. Bearded Wheat, or what is called Rivets, is said to be most natural to moist clayey land; and beardless Wheat to dry light land. The white varieties of Wheat form and succeed better in very dry seasons, or on very dry, warm, sandy soils, than the red or brown varieties. The red and brown varieties seem better fitted for tenacious clayey soil than the white varieties are.—*A Practical Farmer.*

Flour of Wheat.—This Table shows the quantity of first, second, and third flour produced from Wheat of various weights per bushel, also the quantity of bran and waste. The numbers of parcels and quantities of each are also given. This is a return from Mr. Mitchel's mills, Cupar, Fifeshire, in July, 1840, the produce of 1839:—

Lots.	No. of bush.	Wght per bush.	Flour. Fine.	2nds.	3rds.	Total.	Bran	Waste	Total.
		lbs.	lbs.	lbs.	lbs.	lbs.	lbs.	lbs.	lbs.
4	480	56	—	45.8	—	45.8	9	1.2	56
5	700	58	40	5 5	2.3	47 8	9	1.2	58
8	1400	59	41	5.8	2.2	49	8 8	1.2	59
7	1600	60	42.5	5.5	2	50	8.8	1.2	60
15	2192	61	44	5.2	1.8	51	8 8	1.2	61
7	1088	62	48.5	2.5	1.5	52.5	8.5	1.0	62

Cost of Drain Tiles.—The cost in Lincolnshire of making drain-tiles 13½ inches long, 4½ inches wide, and

4 inches high, outside dimensions when burnt is, for digging, wheeling, turning, and grinding the clay, 3*s.* per 1000; for moulding, 2*s.* 6*d.*; for burning, delivering, and for waste, 3*s.*; in all 8*s.* 6*d.*, exclusive of coals and leading. In 1831 one million and a half of these tiles were supplied to one land-owner, who was charged 22*s.* 6*d.* per 1000 for them by the maker. When the expense of 1*s.* for grinding is added to 2*s.* 6*d.* for moulding, making in all only 3*s.* 6*d.*, the slight advantage of machinery now in use to effect these processes will appear. Where its application actually does reduce the cost, it can only be by reducing the 3*s.* 6*d.* paid for moulding and grinding, for the other charges remain the same. Few use a bottom or tile sole. There are tile works now constructing where it is proposed to take the clay as soon as dug, at any season of the year, pulverize it without adding water, and mould it into tiles, all by one operation by pressure; and at one quarter of an inch thick the tiles are of sufficient strength; they have inward projections to dispense with the use of tile soles. Pipe tiles, and those of other shapes, as well as sewer tiles, are to be produced of equal comparative strength.—*Anonymous.*

Experiments upon Turnips at Rothamstead, Herts—Soil, heavy loam. Three previous crops, Wheat, Clover, Wheat without manure. Sown July 24th. Weighed December 19th. Space occupied by each experiment one third of an acre, the weight of Bulbs per acre are given, all dirt, root, and top being completely removed. The Turnips in Nos. 6, 15, 16, 17, 19, and 21, were safe from the fly a week before the others, and maintained a striking superiority over them during the first two months:—

	Tons.	Cwt.	Qrs.
1. Horse dung, 12 Tons	9	9	2
2. No Manure	4	3	3
3. Rape Cake, 14 bushels, 50 lb. per bushel	8	4	3
4. Rape Cake, 12 bushels, Yeast, 2 bushels	8	1	1
5. Yeast, 2 bushels	10	19	2
6. Super Phosphate of Lime, 4 bushels; Phosphate of Ammonia, 12 lb.; Yeast, 4 bushels	11	14	1
7. Phosphate of Ammonia, 56 lb.	6	18	2
8. Super Phosphate of Lime, 4 bushels; Rape Cake, 8 bushels	12	2	2
9. Super Phosphate of Lime, 2 bushels; Rape Cake, 12 bushels	10	8	2
10. Super Phosphate of Lime, 4 bushels; Phosphate of Ammonia, 20 lb.; Rape Cake, 4 bushels	11	7	3
11. 2 bushels Super Phosphate of Lime; Phosphate of Ammonia, 40 lb.; Rape Cake, 2 bushels	10	12	0
12. 2 bushels Super Phosphate of Lime; Phosphate of Ammonia, 10 lb.; Rape Cake, 8 bushels	9	16	0
13. 6 bushels Super Phosphate of Lime; Phosphate of Ammonia, 20 lb., Rape Cake, 6 bushels	11	18	0
14. 5 bushels Super Phosphate of Lime; 2 bushels Phosphate of Magnesia	12	9	1
15. 5 bushels Super Phosphate of Lime; 2 bushels Phosphate of Potash	11	15	0
16. 5 bushels Super Phosphate of Lime, 1 bushel Phosphate Magnesia, 1 bushel Phosphate Potash	11	17	2
17. 5 bushels Super Phosphate of Lime; 1 bushel Phosphate of Potash, 1 bushel Phosphate of Magnesia; 40 lb Phosphate of Ammonia	12	15	0
18. Super Phosphate of Lime, 6 bushels, Yeast, 6 bushels; Rape Cake, 2 bushels	12	14	3
19. 7 bushels of mixture, composed of 60 parts Super Phosphate of Lime, 10 parts Rape Cake, 4 parts Phosphate of Ammonia	11	19	2
20. Unburnt Bones decomposed by Sulphuric Acid, 7 bushels, Rape Cake, 7 bushels	11	15	0
21. 7 bushels Super Phosphate of Lime	12	3	2

—*J. B. Lawes.*

Lichens eaten by Squirrels.—Perhaps some of the readers of the *Chronicle* are not aware that the squirrel feeds greedily upon Lichens. I was not aware of this until a few days ago, when my attention was attracted by one running up an Arbor vitæ, with a piece of an Oak-branch about a foot long. When it had ascended about half-way up the tree, it began to eat the Lichens from the branch, which was densely crowded with them. I had not stood two minutes when it took fright at me, and dropped the branch. I examined it, when I found about 8 inches in the centre of it quite clear of Lichens, and part of the bark also bit off. The Lichen was the Ramalina fraxinea.—*J. Drummond, Blair-Drummond.*

The Markets.—I am glad to find you resolved to give market prices on good authority. Such a plan deserves every encouragement; for, as they are now published, they are much worse than useless. I cannot, however, compliment you upon the manner in which it was done last week. Nothing can be more absurd than Foreign and English White Clover, 74*s* to 84*s*. I will defy any one to buy it at that price. I know that some second-rate of last year's was sold to-day at 90*s*, and some first-rate was sold on Monday at 120*s*. For Trefoil no return is given, though there is plenty of it ranging from 30*s*. to 40*s*. English Red Clover is wrong, too; and you have actually no return for Tares, though plenty are to be bought. However, time will improve, I dare say.—*Peter Schlemihl, Jan.* 10.——Another correspondent complains of the unbusiness-like form in which Wheat is given. "For instance, the price of Wheat from Norfolk, Lincolnshire, &c., is stated at 47*s*. to 54*s*.; but, from the form of the report, it is quite impossible to know whether White or Red Wheat is meant. Of course the value of reports depends entirely upon their accuracy and fulness; and now that your Paper aims at an Agricultural character, accuracy and fulness will be looked for in that department."—[In reply to these criticisms, we can only say that the reports are given on the authority which we quote, and that we have done all that we believe it possible to do to obtain correct returns.]

Management of Manure in Farm-yards.—We have been requested by Mr. Harrison, of Devizes, to publish a letter on the Management of Manures, which he addressed to the Royal Agricultural Societies of England, Scotland, and Ireland, some months ago. It was at that time published in many of the Agricultural papers, and on that account we the less regret our inability from want of room, to insert the whole of it. Mr. Harrison recommends that, instead of allowing the manure to remain on the surface of the yards, it would be better to form it into ricks round the tank, so that it may be supplied with the liquor during the time of making. He recommends that all weeds, cuttings, and parings from roads, deposits in ditches, rubbish from gardens, &c. &c., should be carried home, and be deposited in these manure-ricks, according to the following directions, viz., "A layer of stable-dung, 1 foot thick, salted; a layer of vegetable matter, 6 inches thick, limed; a layer of stable-dung, 1 foot thick, salted; a layer of vegetable matter, 6 inches thick, limed; a layer of stable-dung, 1 foot thick, on the top of this fifth laying; saturate with the liquid from the tank in sufficient quantity to pass through the whole. Begin again, and repeat the layers as before with the dressings, and make the ricks to any size, the larger the better; then cover them up close with long dung or straw (earth would be better) to keep in the ammonia and prevent the rains from penetrating." Mr. Harrison justly remarks, that "A *clean farm* is not to be obtained without attending to the use of manure properly decomposed, and also to that of *liquid* manure, as these take no filth to the land." He states, in conclusion, "*Complicated recommendations* for a general plan to be adopted in the manufacturing of farm-yard manure would, I am convinced, from the experience I have had with Agriculturists, have no general effect." And he says "from experience" what we were at first inclined to doubt, that the plan he has suggested is very plain and simple, so as to be in the power of any one to adopt; and that those who may feel inclined to try it will find their manure doubled by it in value.

Bones.—A few months back I addressed you on the comparative merits of boiled and unboiled bones. In your reply you appeared to give a decided preference to the former, notwithstanding the enormous loss of grease in the process of boiling—say 50 per cent. I have since had a little conversation with a respectable Scotch farmer from Roxburghshire, from whom I elicited some interesting facts bearing on the above subject, although he was not aware at the time what my object was. I inquired if bones were still in great estimation in his neighbourhood? He replied that, for the last three or four years the farmers had neglected them altogether, in consequence of little or no effect being produced by them on the Turnip crop, and that they were now glad to return to the farm-yard for their supply of manure. He further added that, five or six years ago, bones only were used for the Turnip crop, and with the most beneficial results. He could form no idea as to the cause of the change which had taken place, nor could he inform me as to the weight per bushel of the bones now and five years ago; but he told me that on the first occasion of bones being used in his immediate neighbourhood, he uncovered a few yards of the drill line after they had been sown some days, and found them covered with an exudation having the appearance of hoar frost (his own expression), and which was, of course, the essential part, viz., fat and grease. About two years ago, when bones were found not to answer, he examined them, as before, but no "hoar frost" was to be found; the examination was repeated several times, but still no exudation was perceptible—he could not account for it. Now, to me, the reason is very obvious: the first were genuine unboiled bones, full of marrow and grease—hence the appearance of "hoar frost;" the last were boiled and stewed till not a particle of fat or grease was left, and consequently there was no "hoar frost." I am not a learned Chemist, and may be wrong in the conclusion I have drawn; but I am open to conviction, and shall feel much obliged by any information on the subject.—*E. R., Halifax.*

Artificial Manures.—If you would take the trouble to ascertain what the real facts are regarding the many new-fashioned manures which farmers are advised to use, you would be doing us a real service, and also how to tell whether the good ones are adulterated. I have tried my hand a little at these things, but I do not feel at all sure that I have ever got my money's worth back again, to say nothing of profit. However, I do not want to set any body against them; only, I want to learn whether they are good for anything or not, and if so, for what? We farmers have no money to waste in fancies; and although we should be glad enough to get better crops if we could, yet we should be also thankful for advice how to proceed. Now that your Paper is started for our information, you should not lose time in making us acquainted with the *truth* in this matter.—*Timothy Kippax, Farmer.* [We perfectly agree with this correspondent on the importance of the subject he names, and have already taken means to do that which he desires. We shall examine all the manures that are on sale, and state every *fact*, for or against them, that we can collect.]

Clover Dodder.—Having reason to believe that the Dodder found upon Clover raised from Indian seed is not the same as that which has been so destructive of late in the Clover-fields of East-Anglia, I should feel much obliged to those farmers, and others, who may have gathered either of those Dodders if they will send a small portion of the plant to me, by post, directed to "St. John's College, Cambridge." A statement of the person from whom the Clover-seed was obtained, and the date of its purchase, would be a valuable addition to the specimens. If this information is afforded to me, I have reason to hope that I shall be enabled to trace the seeds of the weed to their native country, and point out a mode of avoiding it in future.—*Charles C. Babington.*

Application of Manure to Water Meadows.—The following are some particulars about our crops of Grass in the Holm:—By means of a water-cart we watered the lower Holm with the manure from the cesspools connected with the mill, diluted with two-thirds water. This, with the exception of the banks of the cut and river, was done in March. The upper Holm we manured with Guano at the rate of 3 cwt. to the acre, and it was irrigated previous to the application of the manure, while that manured with the night-soil and urine was irrigated subsequent to manuring. To prevent the water from washing away the manure, it was dammed up and allowed to sink into the land, which it soon did, as the soil is alluvial and sandy. I believe scientific irrigators do not consider this plan so good as allowing it to flow over without stagnating; but this would have wasted our manure, and the plan succeeded so well, that we had an abundant crop by the 1st of June. We did not cut until the 8th, on account of the unfavourable weather before that time; but were then so highly favoured as to harvest the whole (14 acres) in less than a week. We had a crop of sixty cart-loads of about 13 cwt. each. We then immediately irrigated again, and cut our second crop (40 cart-loads of 13 cwt.) in eight weeks from the first cutting. As soon as the second crop was secured, we manured the banks of the cut and all the more impoverished parts of the field with a good coating of dung from the stable-yard and cow-midden, which was overgrown and out of sight in about a fortnight. Our cesspools connected with the mill are now so large and well supplied with valuable manure, that I hope we shall have little or no occasion to use Guano, except upon those parts of the field which we cannot reach with the water-cart. In addition to the urine and night soil flowing into these cesspools, we turn in the ammoniacal liquor from the gas-works, which we find to be a powerful stimulant; and we fix the ammonia by putting in a daily supply of a sulpho-phosphate of lime (from bones), which some of the manufacturing chemists produce in large quantities and sell at a cheap rate, and which we find far more effectual for the purpose than either gypsum or sulphate of iron, and far less dangerous and less troublesome than sulphuric acid.—*T. G.*

Societies.

HIGHLAND AND AGRICULTURAL SOCIETY.

THE monthly meeting in the Museum was held on Wednesday, Jan. 3, under the presidency of the Earl of Roseberry. The first communication was from Dr. Morison, of Banchory Devenick, descriptive of a guard for protecting the piers of bridges over rivers against accidents from floating timber. Sir John Graham Dalyell then described the model of a machine for weighing cattle and sheep and other commodities, constructed by Mr. John Craig, Glasgow. This machine resolves itself into a steelyard. One pound in the scale balances one stone on the platform. Sir George S. Mackenzie exhibited to the meeting a chondrometer, made by Mr. Adie, optician, Edinburgh. Mr. Borthwick, of Crookston, then read a communication from Mr. M'Lean, Braidwood, near Penicuik, in continuation of experiments made by him in 1842 with certain manures. One field of Grass that had been top-dressed with saltpetre, nitrate of soda, salt, soot and earth, ashes and earth, and soot, and intended for Hay, was obliged to be pastured by the dairy stock, along with other pasture lying contiguous. Throughout the season the cows seemed to relish the Grass in all the pasture alike, except that dressed with soot, in which they allowed almost all the Grasses to run to seed, and the Clover did not seem to thrive so well upon it. Another field of inferior soil was top-dressed, an acre to each, with sulphate of ammonia, guano, guano and sand, soot and earth, nitrate of soda, salt, urine, saltpetre, and a portion left without any top-dressing. The Grass was made and cut into Hay, and the general results were, that the portion which had no top-dressing yielded only 3*l.* worth of Hay, at 8*d.* per stone of 22 lbs., whereas each of the other portions yielded nearly double that value, the greatest being derived from the soot and earth, mixed in the proportion of 15 bolls of soot to 10 cart-loads of earth, the Hay after which was worth 6*l.* 2*s.* 8*d.* The crop of Oats this year, after Grass that had been top-dressed with 30 cart-loads of farm-yard dung, was 20 per cent. superior to that on portions top-dressed with 15 cart-loads of farm-yard dung and various sorts of artificial manures, especially where the sulphate of magnesia, carbon, nitrate of soda, sulphate of ammonia, and urine were applied. A description of a model of a single horse cart, constructed by Mr. James Dryden, Builder, Saunders-street, Stockbridge, Edinburgh, was read by Mr. Dewar. The improvement intended to be attained by this model consists in placing the cart with its load upon the axle farther forward or backward than its ordinary position, by means of an adjusting screw worked behind the cart, according as the load is to be drawn up or down hill, so as always to retain the same weight upon the horse's back. A statement as to the mode of erection and tenure of cottages for labourers and tradesmen on Mr. Hope Johnstone's estates of Annandale, by Mr. Charles Stuart, of Hillside, factor on these estates, was read by Sir Charles Gordon. The last two communications were read by Mr. Milne—the one affording a comparative view of the value of moss land in its improved and unimproved state, and experiments made thereon with different manures, by Mr. Carstairs, of Springfield, near Penicuik; and the other detailing experiments with the same class of manures on the farm of Auchencraw Mains, in Berwickshire, by Mr. Edward Makins. Mr. Carstairs states, in regard to the improvement of his moss land, that about 30 years ago, when it consisted of 253 acres, at an elevation of above 800 feet above the sea, it was let for 10*l.* a year, or 9½*d.* per acre, for sheep pasture, and then inhabited by only 5 persons. In 1843, two thirds of that quantity (the remainder being deep flaw moss) yielded from 70 to 80 small stacks of Corn,

containing from 5 to 8 bolls each; from 2000 to 3000 stone of irrigated meadow Hay; from 2000 to 3000 stones of Clover Hay; and from 500 to 600 bolls of Potatoes. There are 8 or 10 cattle, 10 horses, old and young, and from 40 to 50 persons living on the land, besides employ- ment given to it to several labourers. All this has been accomplished by draining the moss with drains at 30 feet apart, 27 acres of which were drained at 9 feet 30 feet apart, and in order to carry this sort of experiment still further, 1 acre was drained with drains placed only 4½ feet apart, for the crop of Potatoes, on which this season Mr. Carstairs was offered 20*l.*, but refused it, as he considered the yield to be 50 bolls, the value of which is six times that of the original fee-simple of the ground. His experiments consisted in raising Potatoes on the drained moss with various ameliorances, such as sand, bone-dust, ammoniacal salts, a mixture of bone-dust, ammoniacal salts, and foreign guano, guano and farm-yard dung; the artificial manures cost 5*l.*, and the farm-yard dung 10*l.*, per acre. Of the extraneous substances, the sand yielded the low- est degree of produce, 8 bolls; the guano the highest, namely, 36 bolls, or 7 tons 16 cwt.; while the farm-yard manure yielded 41 bolls, or 8 tons 8 cwt. per acre. Another set of experiments with Potatoes, the manures of which cost 3*l.*, and the farm-yard dung 6*l.* per acre, gave the lowest result on furrow-drained land, inclining to the west, with bone-dust, at 11 bolls, or 2 tons 6 cwt. per acre; and the highest, with farm-dung, 21 bolls, or 4 tons 7 cwt. per acre; but Potatoes planted in the same field ten days earlier yielded with farm-dung 37 bolls, or 7 tons 12 cwt. per acre. The results of experiments in Turnips with the same class of manures gave the lowest return from gypsum, which was 7 tons; and the greatest from farm-yard dung, or 27 tons per acre. The experi- ments of Mr. Makins were made on Turnips in 1843, on soft, light, hazel-coloured soil, resting on a sandy sub- soil, and succeeding a crop of Oats after two years' old ley. The manures employed were guano and farm-yard dung, guano and bones, guano, oil-cake refuse, bones, bones and farm-yard dung, and farm-yard dung. The greatest result, viz., 23 tons 14 cwt., was obtained from guano, at a cost of 3*l.* 18*s.* 1½*d.*, yielding a profit of 3*l.* 4*s.* 1*d.* per acre, at 6*s.* per ton. The lowest result was given by the farm-yard dung, which, at a cost of 5*l.* 11*s.*, yielded 20 tons, and left a profit of only 9*s.* per acre. The announcement of books and other donations presented to the Society was postponed till next meeting.

Rebiews.

Remarks on Lancashire Farming.
By Law. Rawstone, Esq. Longman & Co.

Mr. Rawstone gives a gloomy account of the state of Agriculture in Lancashire.

"The Corn crops look scanty, backward, and half-starved; the grass-land, much of it, as it were, totally abandoned. The whole country seems as if it was running wild with neglect and impoverishment; all attempts at neatness disregarded; no sign of the higher order of cul- tivation being anywhere visible."

There cannot have been much improvement in a district of which this account is true, since the day when Mr. Dickson reported its condition to the Board of Agricul- ture in 1815.

This little book, though addressed especially to Lanca- shire farmers, is capable of being made useful by any of its Agricultural readers.

"The inferiority of Lancashire farming to that of most other parts of the kingdom has not been here dwelt upon for the purpose of raising an invidious comparison, nor of depreciating efforts already laudably made; but rather to spur the country on to a higher range of generous rivalship."

And in order to attain this object, Mr. Rawstone has not only shown up his county, by contrasting it, perhaps too vividly, with other districts; but he states the causes to which the inferiority of its Agriculture is owing, and the methods by which these causes may be removed. All this is exclusively for his neighbours, but the general statement, with which he begins his work, of what it is which constitutes good farming, and the details connected with methods of drainage, and various other branches of cultivation, which he gives us in the course of it, may be made useful by all.

Miscellaneous.

Depth at which Seed should be Planted.—Various experiments have been tried to determine the proper depth at which seeds should be planted. The following result is given by Burger, vol. i., p. 296, with respect to Maize, or Indian Corn:—That which was planted at the depth of

No. 1.	1 inch,	came up in	8½	days.
2.	1½	,,	,,	9½ ,,
3.	2	,,	,,	10
4.	2½	,,	,,	11½
5.	3	,,	,,	12
6.	3½	,,	,,	13
7.	4	,,	,,	13½
8.	4½	,,	,,	—
9.	5	,,	,,	—
10.	5½	,,	,,	17½
11.	6	,,	,,	—

The Nos. 8, 9, 11, were dug up after 22 days, and it was found that No. 8 had an inch more to grow to reach the surface of the earth. Nos. 9 and 11 had just sprouted, but were short, and were three inches below the surface. No. 10 came up in 17½ days, but the tender leaf remained only six days green, and then withered. There is no experiment which shows more clearly the advantage of a shallow planting in a soil not too loose and trodden down than this. The more shallow the seed was covered by the earth, the more rapidly the sprout made its appearance, and the stronger afterwards was the stalk. The deeper the seed lay, the longer it remained before it came to the surface. Four inches was too deep for the Maize, and must also be so for yet smaller grain kernels. It, indeed, came up at that depth, but on the 15th day after it was planted, the experiment being made in the hot time of the year, in June; in the colder season of spring it would have been 18 or 20 days. If the germ-leaves of the seed lie too long under ground they begin to get twisted, and will be bleached and die, as in No. 10, or form weak plants, as in Nos. 7 and 11. Petri cites an experiment made with respect to Rye, in Oct. 1817, with the follow- ing results:—

Depth of Seed.	Appeared above ground in	Number of Plants that came up.
½ inch,	11 days,	7-8th
1 ,,	12 ,,	all
2 inches,	18 ,,	7-8th
3 ,,	20 ,,	6-8th
4 ,,	21 ,,	4-8th
5 ,,	22 ,,	3-8th
6 ,,	23 ,,	1-8th

The root stalk always forms itself next below the sur- face of the ground, and if we place the grain deep it must first put out its sprouts to the surface, and form its side- branches in a nearer connexion with the air. We never find that the sucker-roots are ranged from below to above, but the contrary. As a proof of the correctness of this opinion, I will here give the interesting experiment of Ugazy in Andre, Okon, Neuigkeiten (Economical Novel- ties), July, 1817. He tried 76, between the 5th and 15th of June, 1817, on good soil, where the seed was well ploughed in, with different grains, to ascertain how deep the root-stalk stood in the earth, and what influence the different depths would have on the formation of the stalk. The results are exhibited in the following Table:—

Name of the kinds of Grain.	Number of root-stalks which remained in the earth. At 1 inch.	At 1 to 1 1-2 inches.	At 2 inches.	At 2 to 2 1-2 inch.	Total.
Winter Rye	742	221	32	5	1000
,, Wheat	765	215	17	—	—
Summer ,,	645	304	42	9	—
,, Barley	631	317	41	11	—
,, Oats	672	241	64	23	—

Name of the kinds of Grain.	Average No. of stalks to a plant. Of the 1st depth.	Of the 2d depth.	Of the 3d depth.	Of the 4th depth.
Winter Rye	2 3-5th	2 1-7th	1	1
,, Wheat	3 4-7th	2 1-8th	1	—
Summer ,,	4 1-6th	2 3-5th	1 1-twelfth	1
,, Barley	3 2-5th	1 3-4th	1	1
,, Oats	1 1-half	1	1	1

We see here that ⅔ to ¾ of all the plants had their root-stalk only one inch under ground, and that it was just these which produced the most stalks; ¼ of them had their roots only 1½ inches deep, and only half as many stalks as the first; at two inches deep there were only four in 100, and at 2½ inches deep only nine of 1000, producing only one stalk a-piece, while the first, in Rye and Wheat, produced 2⅜ to 4⅙ stalks. From this it is clear that shallow sowing, if the seed is only so far covered as to sprout, and the germ is protected from immediate contact with the air, is preferable to laying the seed deep, because it springs up quicker, and acquires a stronger growth, and has hardier plants.—*Note to Burger's Eco- nomy of Farming.*

Rearing Cattle, with a view to Early Maturity.—The production of beef at the quickest and cheapest rate being the object in view, the first requisite is a stock of cows possessing qualities suitable for this purpose. Ac- cordingly, they should be good milkers—able to keep at the rate of two and a half to three calves each—of a kind known to have a tendency to fatten readily, and to come early to maturity, and of a structure likely to produce a vigorous well-grown steer. In other words, they must be good short-horns; only having more regard to their milk- ing properties than is usually done by breeders of bulls. And here it may be well to notice, that it is in general highly inexpedient for the beef grower—the farmer who depends largely on his regular cast of fat cattle—to at- tempt breeding his own bull. It is only a few individuals in any district who have the taste and skill requisite for this difficult department of the business, not to mention the large capital which must necessarily be invested in it, the precariousness of the return, the greater liability to casualties of such high-bred animals, and the additional expense of their housing and maintenance. On Tweed side, the breeding of bulls is confined to a very limited number of persons, chiefly Northumbrians, who, by de- voting their whole attention to this department, are able, from year to year, to furnish a class of bulls which are steadily improving the general breed of the district. The contrary practice is at this moment compromising the character of this valuable breed of cattle in several districts of Scotland into which they have been more recently in- troduced. Made wiser on this point by experience, the farmer of the Border purchases from some breeder of established reputation a good yearling bull, which he uses for two or three seasons, and then replaces by another in like manner. This bull serves his own cows and those of his hinds, and some of the neighbouring villagers; and thus, though his own stud be limited to six or eight cows, he can select from the progeny of his own bull as many calves as he requires to make up his lot, and has them more uniform in colour and quality than could otherwise be the case. As the male parent, among sheep and cattle, is known to exert by far the greatest influence in giving character to the progeny, and increasingly so in proportion to the purity of his breeding, it is evidently much for the advantage of the beef grower to spare no reasonable trouble and expense in obtaining a bull of thorough purity, and then to select his calves with the most scrupulous attention. From overlooking all this, how often may lots of cattle be seen, on the best of land, too, which can only be fattened at an enormous expense of food and time, and, after all, are so coarse in quality as to realize an inferior price per stone. Occasionally a few beasts of the right sort will be seen in such lots, which, by going ahead of their fellows, to the extent of 4*l.* or 5*l.* a-piece of actual market value, show what might have been done by greater skill or attention on the part of the owner. It is very desirable to have all the cows to calve betwixt 1st February and 1st April. If earlier, they will get almost dry ere the grass comes, and calves later than this will scarcely be fit for sale with the rest of the lot. When a calf is dropt, it is immediately removed from its dam, rubbed dry, with a coarse cloth or wisp of straw, (this being what the cow would do for it with her tongue, if allowed,) and then placed in a crib in the calf- house among dry straw, when it receives a portion of its own mother's first milk, which, being of a purgative qua- lity, is just what is needed by the young animal. For a fortnight, new milk is the only food suitable for it, and of this it should receive a liberal allowance thrice a day; but means should now be used to train it to eat linseed cake and sliced Swedish Turnip; and the readiest way of doing so is to put a bit of cake into its mouth immediately after getting its milk, as it will then suck greedily at anything it can get hold of. By repeating this a few times, and placing a few pieces in its trough, it will usually take to this food freely, and, whenever this is the case, it should have as much as it can eat, that its allowance of milk may be diminished, to meet the necessities of the younger calves which are coming in succession. This is of the greater importance that it is always most desirable to avoid mixing anything with their milk by way of helping the quantity. When a substitute must be resorted to, oatmeal porridge mixed with the new milk is perhaps the best. Sago has of late years been much used for this purpose; but an eminent English veterinary surgeon has recently expressed a very decided opinion that its use im- pairs the digestive powers of the animal, and predisposes to disease. The sour smell invariably found in a calf- house, where porridge or jelly of any kind is mixed with the milk, is proof sufficient that indigestion is the conse- quence. An egg put into each calf's allowance, and mixed with the milk by stirring with the hand, is a good help, and never does harm; but, with this exception, it is best to give the milk warm and unadulterated, however small the quantity, and along with this, dry farinaceous food, turnips and hay, *ad libitum*. If more liquid is needed, a pail with water may be put within their reach, as this does not produce the bad effects of mixed milk. Indeed, in this, it is best to keep as closely as possible to the natural arrangement according to which the calf takes its suck—at first frequently, and then at longer intervals, as it becomes able to eat of the same food as its dam. The diet of the cows at this season is a matter of some consequence. Swedish Turnips yield the richest milk, but it is too scanty, and calves fed on it are liable to in- flammatory attacks. Globe Turnips should, therefore, form their principal food during the spring months. Care must also be taken that they do not get too low in condition in the autumn and winter, and for this end it is well to put them dry at least three months before calving. Some may think this long; but, on a breeding farm, milk is of little value at this season. The cows, when dry, are kept at less expense, and, by this period of rest, their con- stitution is invigorated, greater justice done to the fœtus, now rapidly advancing to maturity, and so much more milk obtained after calving, when it is really valuable. When the calves are from four to six weeks old, they are removed from their separate cribs to a house where several can be accommodated together, and have room to frisk about. So soon as the feeding-yards are cleared of the fat cattle, the calves are put into the most sheltered one, where they have still more room, and are gradually pre- pared for being turned to grass; and, when this is done, they are still brought in at night for some time. At six weeks old, the mid-day allowance of milk is discontinued, and at about 14 weeks they are weaned altogether. When this is done, their allowance of linseed cake is increased; and, as they have been trained to its use, they readily eat enough to improve in condition at this crisis, instead of having their growth checked, and acquiring the large belly and unthrifty appearance which used to be considered an unavoidable consequence of weaning. The cake is continued until they have so evidently taken with the grass as to be able to dispense with it. They are not allowed to lie out very late in autumn, but, as the nights begin to lengthen and get chilly, are brought in during the night, and receive a foddering of tares or clover foggage. When put on Turnips, the daily allowance of cake (say 1 lb. each) is resumed, and continued steadily through the winter and spring, until they are again turned to grass. This not merely promotes their growth and feeding, but (so far as the experience of five or six years can determine the point) seems a specific against black-leg, which was often so fatal as altogether to deter many farmers from breeding. It may be well to state here distinctly the particular purpose for which cake is given at the dif- ferent stages of their growth. At first, the object is to accustom them to a wholesome and nutritious diet, which will supplement the milk obtained from any given number of cows, so as to admit of a greater number of calves being reared, and, at the same time, have greater justice done them than could otherwise be practicable. At weaning-time, again, it is given to help the young ani- mal over the transition from milk to Grass alone, without check to growth or loss of condition. During the follow

ing winter, however, the special object of its use is to prevent blackleg, as, but for this, Turnips *ad libitum* would be sufficient. When put to Grass as year-olds, they decidedly thrive better on sown Grass of the first year than on old pasture, differing in this respect from cattle whose growth is matured. They are laid on Turnips again as early in the autumn as these are ready; and it is a good practice to sow a few acres of globes to be ready for this express purpose. It does well to give the Turnips upon the Grass for 10 or 14 days before putting them finally into the feeding-yards; and then, if they can be kept dry and warm, and receive daily as many good Turnips as they can possibly eat (globe till Christmas and Swedish afterwards), they will grow at a rate which will afford their owner daily pleasure in watching their progress, and reach a weight by the 1st of May which, if markets are favourable, will reward him well for all his pains. The leading features of this system are, uniform good keeping, and progressive improvement; in other words, to get them fat as soon after birth as possible, and keep them so till they reach maturity. The details given above are a description of the expedients generally adopted by the breeders of this district for securing these objects.—*Mr. Wilson, Transactions of the Highland Society.*

Situation of Guano.—M. Teschemacher presented specimens of Guano just received from the coast of Peru, containing feathers. With reference to the opinion entertained by some, that the Guano had been accumulating from a period perhaps prior to the origin of the human race, Mr. T. translated the following passage from the "Mémorinles Réales" of "Garcilasso de la Vega." Lisbon, 1609, p. 102. "On the sea-coast from below Arequipa as far as Tarapaca, which is more than 200 leagues of coast, they use no other manure than that of marine birds, which exist both great and small on all the coasts of Peru, and go in flocks perfectly incredible, if not seen. They are reared on some uninhabited islands which exist on that coast, and the manure that they leave is of inconceivable amount. At a distance the hills of it resemble the mounds on some snowy plain. In the time of the Incas there was so much vigilance in guarding these birds that, during the rearing season, no person was allowed to visit the islands under pain of death, in order that they might not be frightened and driven from their nests. Neither was it allowed to kill them at any time, either on or off of the islands, under the same penalty." Each district or territory also had a portion of these islands allotted to it, the penalties for infringement of which were very severe. From this extraordinary case it is probable that the Incas did not permit any remarkable consumption of this valuable manure beyond the annual additions; and the consumption during the depopulation of South America by the Spaniards could, by no means, have equalled those annual deposits. Even the greatest thickness of 700 to 800 feet, might without extravagant calculation be deposited in about 3000 years, at the rate of two or three inches a year. The feathers do not appear different from those of birds of the present day. Mr. Blake, a member of our Society, who has visited these deposits, has a shell found in the Guano, very much resembling the Crepidula fornicata of this coast, but not in any way fossilized. On this coast it never rains, so that the deposits of manure are not, like those on other coasts, annually washed away.—*Proceedings of Boston Society.*

Irish Landlords.—Notwithstanding the abuse heaped upon Irish landlords, I think I may safely assert that the landed proprietors of Ireland, as a body, will bear a comparison with those of any other part of the United Kingdom, in an anxious desire to better the condition of their tenants, and improve the cultivation of their estates. I do not here include *middlemen*, "whose own the sheep are not," and who have no permanent interest in the land or its occupiers.—*Mr. Blacker, English Agricultural Society's Journal.*

Supply of Air to the Roots of Plants.—The breaking up of the surface of cultivated land, either by the plough, spade, or hoe, for the reception of seeds or plants, is a process so universally practised and indispensable for the well-being of the crops intended to be raised thereon, that it may be deemed incredible that so common and simple an affair should not be universally understood. The surface of the earth is one of the sources whence plants obtain the elemental food requisite for their development, and certain conditions of this surface are absolutely necessary. Humidity, heat, and air, in due proportions, are indispensable both to the fibrous roots which are extended in the earth, and to the head of the plant expanded in the air. There is more danger, however, from the excess of moisture than from the extremes of either heat or air; because, when the soil is saturated with water, the access of the general air and its gaseous properties is excluded, and the delicate fibres imprisoned and choked, it may be said, for want of breath, must in such cases necessarily languish.—*Journal of Agriculture.*

Agricultural Education.—In order to give the young farmer an education adapted to his profession, we are in this neighbourhood endeavouring to establish a school wherein all the necessary sciences will be taught, and to which a farm is to be attached, on which the pupils may be employed half the day in practically carrying out the theory of the school. To carry out an improved system of Agriculture with success requires a man of no ordinary capacity—he should, of course, combine a knowledge of the sciences with practical experience, and to carry out his views he must have great moral courage, perseverance with patience, and enterprise with caution, and unite the whole with habits for general business. I am not sanguine enough to suppose the proposed school would give men the whole of these requisites, but it would establish principles which could be acted on by all.—*Ed. Bowley, Gloucester Journal.*

Guano in Caithness.—There is a great abundance of Guano to be found in Caithness, Sutherland, Orkney, and Zetland, amongst the islands and cliffs of the rocks. I last year made trial of it from an island near Incholm, took a boat in the morning, and, with some small spades, masons' trowels, and some bags, clambered to the top, about 30 feet high, to the resort of the seafowl, from which, in an hour's time, three of us nearly filled the boat with excellent stuff resembling dirty lime. The season was past to try it on vegetables, and not being a farmer, I used it in top-dressing a flower-garden, where it had an astonishing effect.—*Corresp. of John o'Groat's Journal.*

Advantage of Deep Drainage.—I had an opportunity the other day of seeing the full advantages of a deep drain. It was in the form of a natural glen or ravine. I found the land on one side of it deep, friable, and warm, margined by very poor shallow cold clay, and on the other side of a medium quality; there was a smaller drain along it on the opposite side. The large drain is about 40 or 50 feet deep, and 100 to 150 broad, and the smaller one about 7 feet both ways. The good land 8 or 12 perches broad, is evidently proportional in width to the depth of drain or ravine.—*Correspondent of the Ayrshire Agriculturist.*

Notices to Correspondents.

COMMUNICATIONS from the following CORRESPONDENTS are in type, and are only waiting till room can be found for them:—*J. D., Facile, A. Campbell, Cultor.*

AMMONIACAL LIQUOR.—*E. R.*—Your compost-heaps will be benefited by soaking them, as you propose, with gas-water. Do not put on the land so many cart-loads of the compost per acre as you would otherwise have done.

CORRESPONDENTS who desire immediate answers to their inquiries will be so good as take care that their letters reach London by the post of Tuesday morning at latest, otherwise replies will be unavoidably deferred till the succeeding week.

DRAINAGE—*Swamp.*—Many extensive land-owners have now operations of the kind proceeding. Lord Portman, in Somersetshire and Dorsetshire; an extensive landed proprietor, whose name we forget, near Preston, Lancashire; the Earl Ducie, near Thornbury, Gloucestershire, are, we believe, among those thus actively engaged in the improvement of their estates.

GAS-LIME.—*E. R.*—By exposure to the air it ultimately becomes a sulphate of lime, identical, in fact, with gypsum. In order that it may the more readily assume this form, it should be spread out and exposed to the air, and at the same time it should be mixed with fresh earth or decomposing vegetable matter; the substances contained in which will fix other valuable but volatile matter which it contains.

MOULD IN HAYSTACKS.—*Omega.*—It is owing to your having put the hay up before it was properly dried.

MANURES.—*A Subscriber.*—Apply soluble manures such as you name, after sowing, as a top-dressing; they will not affect the taste of the root. Sea-weed is said to be a good manure for Carrots; if so, in inland situations, kelp, the ashes of seaweed, will be a good substitute for it. You may depend upon it, however, that no manure for any crop will beat what is made in the farm-yard from the consumption of that crop. Of the three you name, viz., guano, urate, and grains, we prefer the first as a top-dressing for grass, at the rate of 2 cwt. or 3 cwt. per acre. Try sulphate of ammonia applied in the same way at the rate of 80 lbs. to 100 lbs. per acre.——*A Lover of Improvement.*—Many of your questions cannot be answered by one ignorant of the circumstances under which his answers would be applied. The usefulness of salt as manure depends, not on the texture of the soil, but on the non-existence there in a useful form of a sufficient quantity of the substances of which salt is composed. The refuse salt of pork-stores is probably more valuable than common salt as a manure, on account of the nitre it contains. Soot and salt are referred to above in reference to "a Subscriber's" question. You must not mix lime with soot, or you will drive off the ammonia to which soot owes its value as manure. Salt would probably not act as a fixer of ammonia in a liquid manure-tank; sulphuric and other acids will, and so will gypsum. We shall publish all useful information we receive respecting the action of manures of various kinds, as the season for their application approaches. We refer you for further information on the subjects you ask about to Cuthbert Johnson's work "on Fertilizers."——*Nottingham.*—Lime should not be mixed with cloacine; it injures it. Prefer mud, peat, soot, charcoal dust, or any powdery absorbent material. Bones are digested in sulphuric, not muriatic, acid, for Agricultural purposes.——*M. T.*—As, from the article in last *Gazette*, it appears that the Rev. L. Vernon Harcourt resides near the sea, M. T. would be greatly obliged by his informing him if he has made any experiments with sea-weed as a manure, and if so, whether he met with any difficulty in decomposing it. Is it necessary to its action that it should be reduced to a uniform mass—or may it be applied directly to the land?

MUSTARD PLANT, &c.—*T.*—We understand your neighbour, Mr. Thimbleby, has 150 acres of newly-inclosed land covered by a promising young plant of Wheat—why not follow his example in the treatment of your land? You will find information on the cultivation of Mustard in Loudon's Encycl. Agric., in the Report to the Board of Agriculture of the County of Essex, and in the last vol. of the English Agricultural Society's Journal.

VALUE OF TURNIPS TO BE CONSUMED BY YOUNG CATTLE.—*Gosyn.*—It depends on the quantity of the straw to be supplied to the cattle, and on their age. Supposing them to be ordinary-sized two-year-olds; ascertain from your neighbour what quantity of straw he intends to supply you with for them during a certain number of weeks, agree on a price for this straw which, however, must, of course, be nothing like the market-price of good straw,, and subtract it from the ordinary charge, in such a case, of 4*s.* a week per head. Your neighbour should pay you the difference.

SMITHFIELD CLUB.—*Fairplay.*—Your letter, to be useful, should have been published some weeks ago—no good purpose would be served by our publishing it now. If the facts were as you state them, it was probably owing to an oversight on the part of the Society's officers.

*** As usual many communications have been received too late for answering this week.

Markets.

SMITHFIELD, MONDAY, Jan. 8.—Per stone of 8 lbs.

	s. d.	s. d.		s. d.	s. d.
Best Scots, Herefords, &c.	4s 0	to 4s 4	Best Downs & Half-breds	4s 4	to 4s 8
Best Short Horns	3 8	4 0	Best Long-wooled	3 10	4 2
Second quality Beasts	3 4	3 8	Ewes and second quality	3 4	3 8
Calves	4 0	4 8	Pigs	3 4	4 4

NUMBERS.—Beasts, 3690; Sheep, 27,140; Calves, 83; Pigs, 367.

FRIDAY, JAN. 12.

In consequence of the depressed state of the dead mar[illegible] since Monday, our trade to-day is heavy, at a decline of nearly 2*d.* per 8 lbs. on Beasts and Sheep. There [illegible] rather a scarcity of good Calves, consequently an advance in price—the best realising fully [illegible]*s.* per 8 lbs.

NUMBERS.—Beasts, 589; Sheep, 9,760; Calves, 133; Pigs, 330.

Sold. 41, West Smith.

HAY, SMITHFIELD, JAN. 12.

HAY, 2*l* 10*s* to 3*l* 8*s* | CLOVER, 3*l* 5*s* to 4*l* 10*s* | STRAW, 1*l* 4*s* to 1*l* 10*s*

Per Load of 36 Trusses.

JOHN COOPER, Salesman.

MARK LANE, FRIDAY, JANUARY 12.—There was very little business doing in the market this morning. Free Foreign Wheat was held at the same prices; of English there was scarcely any offering. We had some inquiry for bonded. Barley, Peas, and Beans remain as on Monday, and Oats are fully as dear, with a better sale.

KINGSFORD AND LEE.

COVENT GARDEN, JAN. 12.—Notwithstanding that the weather has been somewhat colder during the week, the Market has been well supplied; but trade still remains dull. Vegetables in general are very good and plentiful. Fruit has also been equal to the demand. Pine-apples are small, but well flavoured; they are rather scarce. Hothouse Grapes are very good and well coloured, but they are becoming less plentiful; Portugals continue sufficient for the demand, and are offered at nearly the same prices as last week. Apples have been brought to the Market in considerable quantities during the week; they have not advanced in price since our last Report; among them we observed some good specimens of Blenheim Orange. Good Pears are not plentiful; the Passe Colmar is selling at from 4*d.* to 3*s.* per doz.; good specimens of Ne Plus Meuris are offered at 1*d.* each. Lemons and Oranges continue abundant. Nuts of every kind are plentiful; English Filberts bring from 60*s.* to 70*s.* per 100 lbs. Pomegranates are selling at 6*d.* each. Vegetables are offered at nearly the same prices as in our last report. Cabbages are good and plentiful, as are likewise Greens and Savoys. Broccoli is becoming rather scarce; the late frosty weather has been somewhat injurious to it. Brussels Sprouts are plentiful; Seakale and Rhubarb are selling at nearly the same prices as last week; the latter is very plentiful and good. Asparagus is plentiful. Parsley, Parsnips and Endive are also good and plentiful. A considerable quantity of American Shallots have made their appearance in the market during the week. Celery is sufficient to meet the demand, but is inferior in quality. Cut Flowers chiefly consist of Erica hyemalis, gracilis and caffra, Epacris impressa, Bignonia venusta, Gardenia radicans, Jasminum revolutum, Lily of the valley, Cinerarias, Chrysanthemums, Scarlet Pelargoniums, Camellias, Azaleas, Tulips, and China Roses.

FRUITS.

Pine Apple, per lb., 4*s* to 7*s*	Red Capsicums, 4*s* to 8*s*
Grapes, hothouse, per lb., 3*s* to 7*s*	Almonds, per peck, 6*s*
,, Portugal, per lb. 1*s* to 2*s* 6*d*	Sweet Almonds, per lb., 2*s* 6*d* to [illegible]
Apples, dessert, p. bush. 4*s* to 12*s*	Nuts, Spanish, per bushel, 16*s*
,, Kitchen, p bus. 3*s* to 7*s*	— Brazil, 16*s*
Pears, per half-sieve, 3*s* to 12*s*	— Hazel, 2*s* to 4*s*
Oranges, per dozen, 9*d* to 2*s*	— Barcelona, 20*s* to 24*s*
— per 100, 3*s* 6*d* to 14*s*	— Cob, per 100 lbs., 60*s* to [illegible]
Lemons, per doz. 9*d* to 2*s*	Chesnuts, per peck, 12*s* to 28*s*
— per 100, 5*s* to 12*s*	Filberts, English, p 100 lbs., 60*s* to [illegible]
Pomegranates, per doz., 3*s* to 6*s*	Barberries, per hf.-sv., 3*s* to 4*s*
Green Capsicums, per 100, 1*s* to 2*s*	Tomatoes, per punnet, 1*s* to 1*s* 6*d*

VEGETABLES.

Rhubarb, per bundle, 1*s* to 1*s* 6*d*	Onions, Spring p. doz. bch., 2*s* to [illegible]
Broccoli, per bundle, 1*s* 6*d* to 5*s*	— Large, per bushel, 2*s* to [illegible]
Brussels' Sprouts, per hf.-sv., 1*s* to 2*s*	— Spanish, per doz., 1*s* 6*d* to [illegible]
Cabbages, per doz., 6*d* to 1*s*	— pickling, p. hf.-sv., 2*s* 6*d* to [illegible]
Asparagus, per 100, 2*s* to 8*s*	Shallots, per lb., 6*d* to 9*d*
Seakale, per punnet, 1*s* to 2*s* 6*d*	Chilis, per 100, 1*s* to 2*s*
French Beans, 3*s* to 4*s* per 100	Lettuce, Cabb., p. score, 6*d* to 1*s*
Autumn Potatoes, 3*d* to 6*d* per lb.	— Cos, per score, 6*d* to 1*s*
Savoys, per doz. 6*d* to 1*s*	Celery, per bun., 6*d* to 2*s*
Greens, per doz. 2*s* to 3*s* 6*d*	Mushrooms, per pottle, 3*d* to 1*s* 3*d*
Potatoes, per ton, 45*s* to 75*s*	Walnuts, per bushel, shelled, 12*s* to [illegible]
— per cwt., 2*s* 6*d* to 4*s*	Small Salads, per punnet, 2*d* to 3*d*
— per bushel, 1*s* 6*d* to 2*s* 6*d*	Watercress, per doz. sm. bun. 3*d* to [illegible]
— Kidney, p. bush., 2*s* to 2*s* 6*d*	Parsley, per doz. bunches, 2*s* to [illegible]
Turnips, per doz. bunches, 1*s* 6*d* to 2*s* 6*d*	Tarragon, per bun. 2*d* to 3*d*
Red Beet, per dozen, 6*d* to 1*s*	Endive, per score, 9*d* to 2*s*
Horse Radish, per bundle, 1*s* to 5*s*	Mint, per doz. bunches, 1*s* to 2*s*
Radish, spring, p. doz. hands, 1*s*	Marjoram, green, p. doz. bun. 1*s* to [illegible]
Carrots, p. doz. bun., 2*s* 6*d* to 5*s*	Chervil, per punnet, 2*d* to 3*d*
Spinach, per sieve, 1*s* 6*d* to 2*s*	Salsafy, per bundle, 1*s* to 1*s* 6*d*
Leeks, per doz. bun., 9*d* to 1*s*	Scorzonera, per bundle, 1*s* 6*d*
Garlic, per lb. 6*d* to 8*d*	

HOPS, FRIDAY, Jan. 12.

THE Hop Market continues to advance, with but few in offer, at the following prices:—

East & Mid Kent Pocks.	8*l* 0*s*	to 10*l* 10*s*	Sussex Pockets	-	5*l* 18*s* to [illegible]
Choice ditto - -	11 0		Choice ditto	-	6 10
Weald of Kent Pocks.	6 0	6 15	Farnham	-	9 15
Choice ditto - -	7 0				

PATTENDEN & SMITH, Hop-Factors.

POTATOES, Jan. 8.

SOUTHWARK WATERSIDE.—There has been a liberal supply from the Northern districts during the past week, but very limited from the Channel Islands and the West of England. We had a sharp frost on the 5*d*, which lasted about 3 hours—a continuance would have considerably assisted the sale of Potatoes. The weather has again returned to its former mildness, but in consequence the trade generally having no stock on hand, the demand for the best sorts has been brisk at the annexed prices.

York Reds - - -	50*s*	to 80*s*	Kent and Essex Whites -		45*s*
Perth - - - - -	60	65	— — Kidneys -		60
Early Devons - - -	—	65	Wisbeach Kidneys -		55
Cornwall - - - -	—	65	— Whites -		45
Jersey and Guernsey Blues	—	50	Prince Regents -		50

SEEDS, FRIDAY, Jan. 12.

Canary - -	per qr	56*s*	to 60*s*	Linseed Cakes, Foreign, p ton	[illegible]
Carraway -	per cwt	60	63	Mustard, White - p. bush.	6

— Cakes, Eng. per 1000	10*l* 5*s*		10*l* 10	Turnip (too variable for quotation)	

KINGSFORD AND LEE.

WOOL.—BRITISH, FRIDAY, Jan. 12.

THE firmness noticed in our last report still exists in the British market. The reports from the manufacturing districts are of a favourable character. The manufacturers, as we have observed, for the most part, have good stocks of Wool, hence they are not disposed to buy largely on speculation, and we cannot expect prices to materially advance.

RURAL CHEMISTRY.

By Edward Solly, Esq., F.R.S.,

[illegible] Chemist to the Horticultural Society of London, [illegible] of the Royal Agricultural Society, and Lecturer [illegible] Chemistry, at the Royal Institution.

&c. &c. &c.

Extracts from the Introduction:—

"[illegible] of the chemical composition of soils and the [illegible] of manures enables us to compre- [illegible] mode in which the latter act; and a knowledge of the [illegible] those substances which plants require, points out the most economical methods of restoring to the soil, by those substances which plants remove from it."

"[illegible] knows what it is that gives the fertilizing powers [illegible] aware of the nature of those substances, he will [illegible] method of preserving and using them: he will [illegible] make the most of the various sources of [illegible] at his disposal, and he will be enabled readily to save [illegible] that, for the want of such knowledge, would otherwise be [illegible]

Index of Contents—continued.

London: 2, Charles-street, Covent-Garden; and may be ordered of all Booksellers.

One Volume, price 7s. 6d.

THE LIFE AND TIMES OF RIENZI.

"Not less interesting than Sir E. Lytton Bulwer's eloquent Romance, and scarcely less romantic, is this historical record of the Conspiracy of Gabrini."—*Monthly Repository.*

'To all who have read Sir E. Lytton Bulwer's 'Rienzi,' its perusal is, in a measure, a duty."—*Spectator.*

"A curious and pleasing volume, and full of matter of historical character and illustration."—*Literary Gazette.*

"The publication of this work is well timed . . . . The Life of Rienzi is to us full of interest."—*Athenæum.*

"Those that wish to become acquainted with the true history of a man, who was, in some sort, the *Napoleon* of his own age and country, would do well to consult the extraordinary narrative of the 'Life and Times of Rienzi.'"—*Tait's Magazine.*

London: Whittaker and Co.

ADAPTED FOR SCHOOLS, PRIVATE TEACHERS, AND STUDENTS.

COOLEY'S ELEMENTS of EUCLID, With Explanatory Appendix and Exercises. Price 4s. 6d. bound.

"The best edition of the Elements which has yet appeared."—*Athenæum.*

"Cannot be easily surpassed."—*Dublin University Magazine.*

COOLEY'S GEOMETRICAL PROPOSITIONS: a Key to the Exercises appended to the Elements. Price 3s. 6d. bound.

COOLEY'S FIGURES OF EUCLID, with Enunciations. Price 1s. 6d.

London: Whittaker and Co.: sold by all Booksellers.

WARM WINTER WRAPPERS, SHOOTING JACKETS, and SUPERIOR OUTSIDE GARMENTS of all kinds (really waterproof).—An extensive variety of the above, also of Berdoe's well-known VENTILATING FROCK (in lieu of the Macintosh) always kept ready—guaranteed to exclude any description or continuance of rain whatever. Those who require really good, efficient, and respectable garments, at the smallest cost possible consistent with TRUE economy, or who wish to avoid disappointment and vexation, will not regret the inspection now confidently invited.—Every article made on the premises in the best manner.

W. Berdoe, Tailor, Waterproofer, &c., 69, Cornhill (north side).

MECHI'S TABLE CUTLERY has long been famed for its admirable qualities, combined with cheapness. His Manufactory is No. 4, Leadenhall-street, four doors from Cornhill. Balanced handles, in sets of 50 pieces, 2l. 10s., 3l. 10s., 4l. 10s. Common kitchen, per dozen, 9s. 6d., 12s., 16s. 6d., 21s., 25s. Table steels, patent sharpeners, cases of dessert knives, Sheffield plated goods, German silver forks and spoons, tea caddies, tea trays, dish covers, &c. Mechi's penknives are excellent, being from 1s. upwards. His peculiar steel razors and magic strop and paste have given comfort to many a suffering shaver, and the Ladies pronounce his scissors to be unrivalled.

SUPERIOR SUBSTITUTE FOR TARPAULIN, &c.

C. MACINTOSH & Co. having made a considerable reduction in the price of the Patent India Rubber Covers for Carts, Waggons, Ricks, &c., beg to call the attention of Users of Tarpaulin and Oiled Sheets, to the superiority of their manufacture as an effectual protection against wet, not liable to crack on being folded, and more economical than any other Waterproof cover.—22, York-street, Manchester; and 46 Cheapside, London.

GLASS SUPERSEDED for HORTICULTURAL PURPOSES by WHITNEY'S CHEMICAL TRANSPARENT WATERPROOF COMPOSITION, rendering Muslin, Calico, or Linen, for the Frames of Greenhouses, Pine, Melon, or Cucumber Stoves, &c., impervious to rain or moisture, admitting light equal to Glass, much warmer, and the plants never burn under it.

Noblemen, Gentlemen, and Gardeners will, by using this composition have the only effectual protection for their Fruit-trees during the blooming season; it is a certain defence from frost, sleet, wind, and blight; its transparency admits the general beams of the sun, with abundance of light, which causes the bloom to expand with increased luxuriance, the fruit to set and swell more freely, much earlier, and a crop of fruit to any extent may be warranted. The covering not to be moved by day (except to thin the Fruit, which will be necessary), till the month of June. It is recommended that the Calico be prepared early, so as to be thoroughly dry before using.

Sold in Bottles, with directions for use, pints, 2s. 6d., quarts, 4s. 6d. each. One pint is sufficient to coat four Frames twice over, each Frame to be 5ft. by 3ft. 3in., or thereabouts. Prepared by George Whitney, Chemist, Shrewsbury. Seedsmen, Florists, and Merchants supplied by Mr. W. Bailey, Chemist, North-street, Wolverhampton. Appointed Agents:—Messrs. Butler and Muckley, Covent Garden, where a sample of prepared calico may be seen; Mr. Watkinson, Market-place, Manchester; Page and Son, Southampton; T. and C. Whalley, Nurserymen, Liverpool.

Agents wanted for London and the country.

PIANO FORTES.—Luff and Co.'s Boudoir or Piccolo Piano Forte, 25l.; Cottage, 27l., Package and use of Case included. For tone, touch, durability, and cheapness, these Piano Fortes are unequalled. Warranted to keep well in tune, and prepared for extreme climates. L. and Co.'s Patent Piano-Fortes equally cheap. Two new Patent Semi-Grands just returned from Hire, very cheap.—Luff and Co., 103, Great Russell-street, Bloomsbury.

BY HER MAJESTY'S ROYAL LETTERS PATENT.

PATENT ASPHALTE ROOFING.

THE above Material has been used and approved by the Nobility, Gentry, and Agriculturists generally, as a Roofing and Covering to sides of Farm Buildings; its advantages are—Lightness, Durability, and Economy. Being a non-conductor, it has been proved an efficient "Protective Material" to Plants, and is now in use at the "Royal Horticultural Society's Gardens, Chiswick." It can be had of any length, 32 inches wide, at 1d. per foot, super. A discount to the trade.

Thos. J. Croggon, 8, Ingram-court, Fenchurch-st., London.

HYACINTHS AND GROWING STOCK.

HUMPHREYS'S COMPOUND, applicable to all Greenhouse Plants, to Hyacinths and other Bulbs, and to promote the germination of Seeds. Sold in bottles 1s. 9d. each, by Flanagan & Son, Mansion-house-street; Warner & Warner, 28, Cornhill; Hurst & McMullen, Leadenhall-street; W. Clark, Bishopsgate-Within; Smith, Islington Nursery; Grimley and Co., Covent Garden; Batt and Rutley, 412, Strand; William and John Noble, Fleet-street; Smith, Covent-garden; Charlwood, Tavistock-row; W. J. Nutting, 46, Cheapside; G. Lawrence, 18, Piccadilly; John Kernan, Great Russell-street, Covent Garden; Lockhart, 156, Cheapside; Shuttleworth, Pantheon; Minier, Adams, and Nash, 63, Strand; Thatcher and Son, Islington; Thomas Watkinson, Market-place, Manchester; W. E. Rendle, Plymouth; Dickson & Co., Edinburgh; Pontey, Leeds; Fisher, Holmes, and Co., Sheffield; P. Lawson and Son, Edinburgh; and other leading Seedsmen in town and country. Wholesale Agents, Davy, Mackmurdo, and Co., 100, Upper-Thames-st., London.

POTTER'S GUANO.—Sir Robert Peel, the Earl of Zetland, and others, have used POTTER'S MANURE with the greatest success on almost every kind of crop and soil. Testimonials may be obtained by application, per post, at the Works, 28, Upper Fore-street, Lambeth, or of any of Mr. Potter's agents.—See also the Advertisement in this Paper of the 6th Jan., containing some of the Testimonials referred to.

GUANO ON SALE BY THE IMPORTERS,

JOHN BOYD & Co.,

Wellington Chambers, London Bridge, Borough.

TO GARDENERS AND AGRICULTURISTS.

SUPER-PHOSPHATE of LIME is capable of producing a more rapid vegetation in Plants than any substance known. It may be had at Mr. Lawes' Factory, Deptford Creek, price 7s. per cwt.

Phosphate of Potash	. . .	15s. per cwt.
,, Soda	. . .	12s. ,,
,, Magnesia	. . .	9s. ,,
,, Ammonia	. . .	1s. per lb.

GENUINE PERUVIAN & BOLIVIAN GUANO

ON SALE, BY THE IMPORTERS,

ANTONY GIBBS and SONS, LONDON;

GIBBS, BRIGHT, and CO., LIVERPOOL and BRISTOL.

47, Lime-st., Jan. 5, 1844.

ON SALE, in any quantity, PERUVIAN and BOLIVIAN GUANO, genuine as imported.—Apply to Cotesworth, Powell, and Pryor, London; Edwards, Danson, and Co., Liverpool; or William J. Myers and Co., Liverpool, the Importers

THE URATE of the LONDON MANURE COMPANY, 5l. per Ton. It is with the greatest satisfaction, after three years' experience, the Company are enabled to recommend the above as one of the best manures for Barley, Oats, Spring Wheat, and more especially Turnips. By promoting a rapid growth of the latter it secures a full plant, at the same time producing a great weight per acre, and extending its beneficial effects to the succeeding crops. The Urate may be sown broadcast, or which is preferable, by the drill, at the rate of one ton to three acres, and it is desirable it should not be placed more than two inches below the surface. As a topdressing for Wheat the Urate has been used with great advantage. Gardeners and Florists will find it very useful for Dahlias and other roots. Full particulars and Testimonials will be forwarded on application. Genuine Peruvian Guano; Phosphate and Sulphate of Ammonia; Gypsum and every other artificial Manure.

Edward Purser, Secretary, 40, New Bridge Street.

NEW FARMERS' NEWSPAPER.

THE time has come when Landlords and Tenants, large Farmers and small, must devote their anxious attention to improved cultivation—when, in the words of Sir Robert Peel, "*All must learn how, in the shortest time, and at the least expense, to produce the greatest quantity of food, vegetable or animal, without permanent injury to the land.*" To accomplish this, no means can be so effectual as that which brings the results of Experience and Science before every man, in a cheap form. For this purpose THE AGRICULTURAL GAZETTE is established.

The Proprietors are aware of the difficulties of dealing with the many details of cultivation without an acquaintance with circumstances, often as varying as places. They condemn the idea of conducting farming operations upon one invariable plan; and, while they welcome science as the best auxiliary of practice, they regard crude speculations as the most dangerous of delusions. But they also feel that in Agriculture, as in all other arts, there are general principles upon which successful farming must depend; that there are practical errors which no local circumstances can justify; in short, that there is room for improvement even in those branches which are best understood. No one man can be competent to deal with the multifarious questions affecting husbandry, and it is duty of the Editor of such a Paper as THE AGRICULTURAL GAZETTE is to make known the knowledge of all. It is to practical Farmers that the Proprietors trust for the means of carrying out their views, and not to the talents of any individual. While, therefore, they state that the Editor of THE AGRICULTURAL GAZETTE is a gentleman well acquainted with the best modes of Farming, in which he is actively engaged, they feel it to be of far more importance to announce the promise of assistance received from the landed and farming interest generally, especially of those whose names they are permitted to mention:—

The Right. Hon. the Earl Spencer, President of the Royal Agricultural Society of England.

The Right Hon. the Earl of Ducie, Vice-President of the Royal Agricultural Society of England
Sir Charles Lemon, Bart., M.P., one of the Council of the Royal Agricultural Society of England
J. H. Langston, Esq., M.P.
Dr. Daubeny, Professor of Botany, Oxford
The Rev. L. Vernon Harcourt

Mr. E. Beck, Rougham, Norfolk
Mr. Shoosmith, Folkington, Sussex
&c. &c. &c.

The Practice of Agriculture—its Science—Animal and Vegetable Physiology—Improvements in Implements—better modes of Husbandry—results of well-conducted experimental Farming—Growth and Rotation of Crops—Stock—Drainage—Irrigation—Foresting—Road-making—Farm-Buildings—Labourers—in short, whatever affects the beneficial employment of capital in land will form topics of consideration. Reports will be given of the English, Scotch, and Irish Agricultural Societies—London Market Prices of Corn, Hay, and Cattle, and the Weekly Averages. Replies to questions connected with the object of the Paper will also be furnished weekly.

Considering the union which exists between Horticulture and Agriculture, it has been thought advisable to make THE AGRICULTURAL GAZETTE an addition to the GARDENERS' CHRONICLE, edited by DR. LINDLEY, and so extensively known; but that there may be ample room for discussion, that Paper *has been increased one-half in size without additional charge*—thus Twenty-four Columns will be occupied, as at present, by Horticulture, and Twenty-four by the General News of the Week, whilst

Twenty-four Columns will be devoted to Agriculture:

This day, therefore, January 13th, is published, price SIXPENCE, stamped to go free by post, the SECOND NUMBER *of*

THE GARDENERS' CHRONICLE
AND
AGRICULTURAL GAZETTE:

A Weekly Record of Rural Economy and General News.

THE HORTICULTURAL PART EDITED BY PROFESSOR LINDLEY,

THE principle on which the Gardening part of this Paper is conducted is to make it a weekly record of everything that bears upon Horticulture, Floriculture, Arboriculture, or Garden Botany, and such Natural History as has a relation to Gardening, with Notices and Criticisms of all works on such subjects. Connected with this part are WEEKLY CALENDARS of GARDENING OPERATIONS, given in detail, and adapted to the objects of persons in every station of life; so that the Cottager with a few rods of ground before his door, the Amateur who has only a greenhouse, and the Manager of extensive gardens, are alike informed of the routine of operations which the varying seasons render necessary. It moreover contains reports of Horticultural Exhibitions and Proceedings—Notices of Novelties and Improvements—in short, everything that can tend to advance the profession, benefit the condition of the workman, or conduce to the pleasure of his employer; accompanied with Woodcuts, whenever the matter treated of requires that mode of illustration.

To this Farming, as explained above, is now added.

Lastly, that description of domestic and political News is introduced which is usually found in a Weekly Newspaper. It is unnecessary to dwell on this head further than to say, that the Proprietors do not range themselves under the banners of any party; their earnest endeavours are to make THE GARDENERS' CHRONICLE a full and comprehensive *Record of Facts* only—a NEWSPAPER in the true sense of the word—leaving the reader to form his own opinions: their object being elucidation of the laws of Nature, not of man. The reader is thus furnished, IN ADDITION TO THE PECULIAR FEATURES OF THE JOURNAL, with such information concerning the events of the day as supersedes the necessity of his providing himself with any other Weekly Paper.

The Proprietors are happy to announce that the following distinguished Botanists, Florists, and Practical Gardeners have already enriched the GARDENERS' CHRONICLE by their communications:—

The Hon. and Very Rev. W. Herbert, Dean of Manchester
The Hon. and Rev. Charles Bathurst
Hon. W. Fox Strangways
Sir Oswald Mosley, Bart.
Sir W. J. Hooker, Royal Gardens, Kew
Dr. Horner, Hull
Dr. Lancaster, F.L.S.
Dr. Neil, Canon Mills
Rev. J. M. Berkeley
Capt. Widdrington
Professor Morren, Liege
J. Bateman, Esq., Knypersley
G. Barker, Esq., Birmingham
E. Barnard, Esq., F.R.S.
Mr. W. Billington, Oswestry
Mr. M'Nab, Caledonian Society's Garden
Mr. Mearns, Botanic and Zoological Gardens, Leeds
Mr. Ingram, Gardener to Her Majesty
Mr. Paxton, Gardener to the Duke of Devonshire
Mr. Alexander, Gardener to the Duke of Leinster
Mr. Ferguson, Gardener to the Duke of Buckingham
Mr. Spenser, Gardener to the Marquis of Lansdowne
Mr. Elliott, Gardener to the Earl of Tyrconnell

Hon. Algernon Herbert
Sir George Mackenzie, Bart.
Sir Charles Wolesey, Bart.
Captain Churchill, R.M.
Dr. Bevan, Llanferry
Dr. Gregory, Aberdeen
Dr. Ingram, President of Trinity College, Oxford
Dr. Winn, Truro
Rev. J. B. Reade
Professor Royle
Professor Graham
G. Wailes, Esq., Secretary of the Hort. Soc., Newcastle
Mr. Appleby, Gardener to T. Brocklehurst, Esq., M.P.
Mr. Marnock, Royal Botanic Society, London
Mr. Cameron, Royal Botanic Gardens, Birmingham
Mr. Henderson, Gardener to the Earl Fitzwilliam
Mr. Frost, Gardener to Lady Grenville
Mr. Haythorn, Gardener to Lord Middleton
Mr. Halliday, late Gardener to Lord Sondes
Mr. Brown, Gardener to Lord Southampton
Mr. Errington, Gardener to Sir P. Egerton, Bart.
Mr. Fortune, Hothouse, Dept., Hort. Gardens, Chiswick
Mr. Thompson, Fruit Dept., Hort. Gardens, Chiswick

Sir James Nasmyth, Bart.
Sir James Macadam
Dr. Hamilton, Plymouth
G. Bentham, Esq., late Secretary of the Horticultural Society
L. W. Dillwyn, Esq., Sketty Hall
J. D. Llewelyn, Esq., Penllrgare
Mr. Campbell, Botanic Garden, Manchester
Mr. Williamson, Botanic Garden, Sheffield
Mr. Bailey, Gardener to the Archbishop of York
Mr. Mackintosh, Gardener to the Duke of Buccleuch
Mr. Moffat, Gardener to the Duke of Newcastle
Mr. Tillery, Gardener to the Duke of Portland
Mr. Cooper, Gardener to the Earl Fitzwilliam
Mr. Bowers, Gardener to the Earl of Lucan
Mr. Forsyth, Gardener to the Earl of Shrewsbury
Mr. Buchan, Gardener to Lord Bagot
Mr. Beaton, Gardener to Sir W. Middleton, Bart.
Mr. Booth, Gardener to Sir C. Lemon, Bart.
Mr. Whiting, Gardener to H. T. Hope, Esq., M.P.
Mr. James Drummond, Gardener, Blair Drummond
Mr. Gordon, Hardy Dept., Horticultural Gardens, Chiswick
Mr. W. P. Ayres, Brooklands
Mr. Wells, Gardener to W. Wells, Esq., Redleaf

OFFICE FOR ADVERTISEMENTS AND COMMUNICATIONS, 5, CHARLES-STREET, COVENT-GARDEN, LONDON.

Orders received by all Booksellers and Newsvenders.

Printed by Messrs. BRADBURY and EVANS, Lombard-street, Fleet-street, in the Precinct of Whitefriars, in the City of London, and Published by them at the OFFICE, 5, CHARLES-STREET, COVENT GARDEN, in the County of Middlesex, where all Advertisements and Communications are to be addressed to the Editor.—Saturday, January 13, 1844.

The Newspaper.

SATURDAY, JANUARY 13, 1844.

PATRONISED AND SANCTIONED BY HER MAJESTY THE QUEEN, H.R.H. PRINCE ALBERT, THE ROYAL FAMILY, AND THE SEVERAL COURTS OF EUROPE.

ROWLAND'S MACASSAR OIL, for the Growth, and for Preserving and Beautifying the human Hair.—Price 3*d*., 7*s*., family bottles (equal to four small) 10*s*. 6*d*., and double that size, 21*s*.

CAUTION.—The words "ROWLAND'S MACASSAR OIL" are engraved on the wrapper of each genuine bottle; and on the back of the wrapper 1,500 times, containing 29,028 letters—without this "None are genuine."

ROWLAND'S KALYDOR,

For Improving and Beautifying the Skin and Complexion.—Price 4*s*. 6*d*. and 8*s*. 6*d*. per bottle, duty included.

ROWLAND'S ODONTO,

Or Pearl Dentifrice, renders the Teeth beautifully white and preserves the Gums.—Price 2*s*. 9*d*. per box, duty included.

CAUTION.—Spurious Imitations are frequently offered for sale as the real articles (some under the implied sanction of royalty), the labels and bills of the original articles are copied, and either a fictitious name or the word "genuine" is used in the place of ROWLAND'S: it is therefore imperative on purchasers to see that the word "ROWLAND'S" is on the wrapper. For the protection of the public from fraud and imposition, the Honourable Commissioners of Her Majesty's Stamps have authorised the Proprietors' Signature to be engraved on the Government Stamp, thus—"A. ROWLAND and SON, 20, Hatton-garden," which is affixed to the Kalydor and Odonto. Sold by them, and by Chemists and Perfumers.

*** All others are Spurious Imitations.

This day, price 6*s*., Part VIII. of the New Edition of

BLACK'S GENERAL ATLAS of the WORLD, containing the Maps Supplementary to the former Edition.

The following is the list of these Maps:—

India—Ceylon and the Punjab
China
New South Wales—South Australia—and Norfolk Island
New Zealand—Western Australia—& Van Diemen's Land
The World as known to the Ancients
The Principal Countries of the Ancient World
Countries embracing the Travels of St. Paul and the Journeys of the Israelites.
Chart of the Isothermal Lines.

The publication of Part VII., containing the Index, is postponed till February, as the Publishers, instead of printing the names of places occurring in the New Maps as a Supplement to the original Index, have resolved to consolidate the whole under one Alphabet, a work of great labour and expense, and necessarily requiring a considerable time in its accomplishment.

The Atlas having been revised and corrected throughout, the Publishers are satisfied that in every respect it is accommodated to the present advanced state of geographical research; and whether on the ground of accuracy, beauty of execution, or cheapness, they invite a comparison with any other work of the class.

ADAM & CHARLES BLACK, Edinburgh; LONGMAN & Co., SIMPKIN & Co., WHITTAKER & Co., and HAMILTON & Co., London; and JOHN CUMMING, Dublin.

BETTS'S PATENT BRANDY.—DISTILLERY, No. 7, SMITHFIELD BARS.—Notwithstanding the publicity for many years past given to the superiority of BETTS'S PATENT FRENCH DISTILLED BRANDY over every other Spirit, British or Foreign, it is yet but partially known: J. T. BETTS and Co. therefore feel it a duty they owe to the Public and themselves, to invite a comparison between the Patent and the French Brandy, until every Family in the kingdom, in which Brandy is consumed, have made trial of their Patent Brandy,—and, consequently, discontinued the use of the Foreign article. Their respective merits are fairly developed in the following Testimonials, to which they again beg to refer:—

EXTRACTS FROM TESTIMONIALS.

"I do not hesitate to express my conviction that your Patent Brandy is fully as free from everything injurious to health, and contains as pure a spirit as the best varieties of Foreign Brandy. EDWARD TURNER, Professor of Chemistry in the University of London. "John T. Betts, Esq."

"I am bound to say, and do assert it with confidence, that, for purity of spirit, this cannot be surpassed; and that your Patent Brandy is also quite free from those acids which, though minute in quantity, always contaminate the Foreign Spirit. JOSEPH HUME, Chemist to His Majesty. "J. T. Betts, Esq."

"Your Brandy is free from uncombined acid and astringent matter, which exists, more or less, in most of the Brandies imported from France. JOHN THOMAS COOPER, Lecturer on Chemistry. "To Mr. Betts."

It is this perfect freedom from the above objectionable qualities, and its agreeable similarity in flavour to the finest samples of Cognac Brandy, that constitute the peculiar value of the PATENT BRANDY.

J. T. BETTS and Co. are, at length, enabled to give a distinct assurance that arrangements will be completed in the course of the present month, which will afford an unfailing protection to purchasers against the continuance of those frauds, from which they have hitherto so extensively suffered; as each bottle will be secured by a PATENT METALLIC CAPSULE, or covering for the cork, of solid metal, with their name, address, and the words "BETTS'S PATENT BRANDY" embossed upon it; the forgery of which subjects the guilty party to a Penalty of Fifty Pounds for every offence.

This valuable Spirit is manufactured only at the Distillery, No. 7, Smithfield Bars, leading to St. John-street; where it may be obtained, either pale or coloured, in quantities not less than Two Gallons, at 18*s*. per Gallon, for Cash, on delivery.

NEW SCHOOL HISTORY OF PALESTINE.

Just published, price 3*s*. 6*d*., or with a Map of Palestine, 4*s*.,

THE HISTORY OF PALESTINE, from the Patriarchal Age to the present time; with Introductory Chapters on the Geography and Natural History of the Country, and on the Customs and Institutions of the Hebrews. By JOHN KITTO, Editor of "The Pictorial Bible," "The Pictorial History of Palestine," "The Cyclopædia of Biblical Literature," &c. Adapted to the purposes of Tuition by ALEXANDER REID, A.M., Rector of the Circus Place School, Edinburgh.

*** This work has been written expressly for its present use, and is in no respect an abridgment of the Author's larger work, "The Pictorial History of Palestine." In its preparation simplicity and precision of style, qualifications so essential to the usefulness of a School-book, have been steadily kept in view, while Questions for Examination have been appended to each Chapter by the Rev. Alex. Reid.

The Volume is also embellished with Wood Engravings, representing Landscapes, Buildings, Plants, Illustrations of Manners and Customs, and whatever can be more clearly displayed by pictorial than by written description, or by which the written text may be in any degree elucidated.

ADAM & CHARLES BLACK, Edinburgh; LONGMAN & Co., London.

FELIX SUMMERLY'S HOME TREASURY OF BOOKS, PICTURES, TOYS, &c.: purposed to Cultivate the Affections, Fancy, Imagination, and Taste of Children.

News of the Week.

THE State prosecutions in Ireland may be said to have fairly commenced, and the preliminary proceedings in the arrangement of the special jury will be read with interest. On Friday the names of the panel were reduced to 24, each party having a right to object to 12 out of the 48 names previously selected. From this reduced list the first 12 persons who answer to their names on Monday will constitute the jury to try Mr. O'Connell and his fellow-traversers. Considerable excitement has been caused in Dublin by the announcement that Government, in the exercise of their right of rejection, have struck off the names of every Roman Catholic on the list; and a public meeting has been convened by the leading Catholics in Ireland to petition her Majesty on the subject. It is alleged, however, on the part of the Government, that every Catholic excluded was a known Repealer, and was therefore considered to be disqualified to act as a juror on the trials. Various rumours have been current during the week respecting the probable abandonment of the prosecutions, but the extensive preparations already made appear to leave little doubt that they will commence, as originally announced, on Monday next.

From France we have the particulars of the debate on the Address of the Chamber of Peers in answer to the King's Speech. The Address contains a complimentary allusion to this country, but in other respects is little more than an echo of the speech. The recent proceedings of the Duc de Bordeaux in London was the subject of an animated conversation, but no direct allusion was made to them in the Address.—In Spain the Ministry have promulgated a decree re-organising the corporations throughout the Kingdom. This measure in 1840 drove Queen Christina from Spain, and has been considered by all subsequent Ministers too perilous to be even submitted to the Cortes. The present Cabinet, however, have enacted it by royal decree, without consulting either the legislature or the country; and such is the condition of the country that it has hitherto been received without any marked expression of public feeling.—From Portugal we have the Queen's Speech on opening the Cortes, and from Greece we have the particulars of the Address to the Throne, adopted by the National Assembly by a majority of 168.—From Canada we learn that the Governor-General intends to form a provisional and temporary council until more permanent arrangements can be made, and that the late Ministers have returned to their homes, virtually relieved of the seals of office. The accounts from the United States are merely commercial, and the proceedings of Congress have hitherto been confined to matters of domestic interest.

Home News.

COURT.—An accident, which was happily attended with no serious result, occurred to Her Majesty on Friday morning in the vicinity of Horton, near Datchet. The Queen, attended by the Marchioness of Douro, proceeded to the meeting of Prince Albert's harriers at Horton, in an open pony-phaeton and pair, driven by a postillion, who taking too short a turn in entering the road near the Five Bells, the near wheel of the carriage, from the rottenness of the side of the road (occasioned by the late frost and rapid thaw), sank into the ditch, throwing the carriage against the hedge; the horse upon which the postillion was riding sinking in from the same cause. Her Majesty and the Marchioness of Douro were speedily rescued from their perilous position by Colonel Arbuthnot, who was in attendance on horseback. A small pony-carriage belonging to Mr. Holderness of Horton, passing by at the moment, the use of it to Her Majesty was immediately offered by the lady who was driving, and accepted by the Queen, who was driven back to the Castle by Colonel Arbuthnot. The hounds being near the spot, a messenger was dispatched to Prince Albert, who accompanied Her Majesty on her return on horseback.—On Tuesday, the Queen and Prince, accompanied by the Prince of Wales, and the Princess Royal, left Windsor for Claremont, where the Court will remain for about a week. On Wednesday and Thursday the Prince went out shooting in the grounds and preserves. The Royal suite at Claremont consists of Earl Rivers the Lord in Waiting, the Marchioness of Douro Lady in Waiting, Colonel Arbuthnot and Sir E. Bowater Equerries in Waiting, Mr. G. E. Anson and the Hon. C. A. Murray.

The Ministry.—A Cabinet Council was held on Monday which was attended by all the Ministers except the Duke of Buccleugh and Mr. Gladstone, who had not then returned to town. Another Council was held on Thursday, which was attended by the whole Cabinet. The Earl of Aberdeen gave the first Cabinet dinner for the season on Wednesday. Sir Robert Peel has addressed a circular to the Conservative members of the House of Commons, stating that public business of importance will be proceeded with at the opening of Parliament, and requesting their attendance on the 1st February.

The Duc de Bordeaux.—On leaving Devonshire on the 3rd inst. his Royal Highness visited Lulworth Castle and other favourite spots he had been accustomed to visit when last in England. He proceeded thence to dine at Upton House, the seat of Edward Daughty, Esq., who had been honoured with a visit of the French Royal Family on their landing at Poole in 1830. On the 4th the Prince left Upton passing through Poole in an open carriage; and the inhabitants in recollection of his landing at that port in his first exile received him with hearty cheers. The Prince went from thence to Canford House, the seat of Lord de Mauley, and then visited the convent of Trappestines at Stapehill, continuing his route to Portsmouth through the New Forest. On Saturday evening he arrived at Brighton, and dined on that day with the Duke and Duchess of Somerset. On Sunday he attended high mass at the Roman Catholic Chapel, and afterwards walked on the Chain-pier accompanied by the Earl and Countess of Shrewsbury, and then took an hour's sail on the sea. His Royal Highness left Brighton in the evening by the last train for London. The Prince on Wednesday visited the dockyard at Deptford, and the Observatory and Royal Hospital at Greenwich. He dined and slept at Woolwich, and on Thursday inspected every department of the Arsenal, returning to town in the evening.

Death of Sir Hudson Lowe.—This distinguished Officer expired on Wednesday evening from the effects of a severe attack of paralysis, from which he has lately been suffering. The name of Sir Hudson Lowe was at one time familiar to the public as the officer to whom was entrusted the custody of Napoleon at St. Helena. In the discharge of his responsible duties, his conduct toward the fallen Emperor was strongly censured, although as a military officer in command obeying the orders of his superiors he was merely the agent of others. It is understood that some interesting documents, together with a Memoir drawn up by Sir Hudson's own hand of the events connected with his custody of Napoleon, are in possession of a friend, to whom he entrusted them for publication, and that Lord Bathurst's orders as to the treatment of the Emperor are among them. Sir Hudson Lowe had served with the Army in France, Portugal, Italy, Sicily, and the Ionian

Islands, and commanded Capri when it was attacked and taken by the French. He was about 70 years of age.

Death of the Admiral of the Fleet.—Sir Charles E. Nugent, the Senior Admiral on the Navy List, died on Sunday. It may be remembered that the gallant officer broke his leg last year by slipping off the curb-stone whilst he was inspecting the Nelson Monument. From the effects of this accident he never recovered, and expired on Sunday last in the 86th year of his age, at Studland in Dorsetshire, the residence of George Banks, Esq., M.P.

General Espartero intends it is reported shortly to leave England, and to take up his residence in Brussels. The Belgian Government however has not received as yet any intimation of the General's intention.

The Lord-Lieutenancy of Suffolk is vacant by the resignation of the Duke of Grafton, who has resigned in consequence of his increasing infirmities and advanced age. The Marquess of Bristol is mentioned as his successor.

The Revenue.—The revenue returns for the year and quarter ending Jan. 5, 1844, were published on Saturday. The total income of the *year* was 50,071,943*l.*, being an increase on the previous year of 5,742,078*l.* This income is composed of the following items:—Customs, 19,073,219*l.*; Excise, 11,794,807*l.*; Stamps, 6,426,155*l.*; Taxes, 4,190,486*l.*; Income-tax, 5,249,260*l.*; Post-office, 592,000*l.*; Crown Lands, 117,500*l.*; Miscellaneous, 1,634,741*l.*; Imprest and other moneys, 168,528*l.*; Repayments of Advances, 825,247*l.*; making a total of 50,071,943*l.* The accounts for the year show an increase in the Excise of 387,503*l.*; Income-tax, 4,678,204*l.*; Miscellaneous, 1,055,330*l.*; to which must be added Repayments of Advances, 142,566*l.*, making a total increase of 6,263,603*l.* There is a decrease in the Customs of 2091*l.*; Stamps, 64,945*l.*; Taxes, 83,106*l.*; Post-office, 13,000*l.*; Crown Lands, 15,500*l.*; to which must be added Imprest and other moneys, 342,883*l.*, making a total decrease of 521,525*l.*; which being deducted from the increase of 6,263,603*l.* gives an increase on the year, as stated above, of 5,742,078*l.* The returns for the *Quarter* show an increase in the Customs of 552,879*l.*; Excise, 8763*l.*; Income Tax, 197,203*l.*; Post-office, 2000*l.*; Repayments of Advances, 96,813*l.*, making a total increase of 857,658*l.* On the other hand they show a decrease in the Stamps of 38,101*l.*; Taxes, 17,306*l.*; Crown Lands, 10,000*l.*; Miscellaneous, 9620*l.*; Imprest and other moneys, 56,961*l.*, making a total decrease of 131,988*l.*; which being deducted from the increase of 857,658*l.*, gives an increase on the Quarter of 725,670*l.*

The National Debt.—The Lords of the Treasury having certified to the Commissioners for the Reduction of the National Debt that the actual surplus revenue of the United Kingdom beyond the actual expenditure for the year ending the 10th October, 1843, amounted to 908,541*l.* 11*s.* 9½*d.*, the National Debt Commissioners have given notice that the sum of 227,135*l.* 7*s.* 11½*d.* (being one-fourth of the said surplus of 908,541*l.* 11*s.* 9½*d.*) will be applied in the quarter ending the 5th April next to the following purposes, viz.:—To the purchase of stock, 27,135*l.* 7*s.* 11½*d.*; to the purchase of Exchequer-bills, 200,000*l.*

The Colonies.—Lieut. General Sir Peregrine Maitland, K.C.B., Governor and Commander-in-Chief of the Cape of Good Hope, left town on Monday for Portsmouth to embark for that colony.—In consequence of the death of the Hon. J. R. Morrison, the Rev. Charles Gutzlaff has been nominated by Sir H. Pottinger to the vacant situation of Chinese Secretary of Hong Kong and Mr. S. Majoribanks has been confirmed in the medical charge of the Consulate at Canton; both appointments however being subject to the confirmation of the Home Government.—The Queen has been pleased to appoint William Fishbourne, Esq., to be Magistrate for her Majesty's settlements in the Falkland Islands.

Church of Scotland.—The Queen has been pleased to present the Rev. R. Stewart to the church of Auchnacle, Argyll, vacant by the transportation of the Rev. H. M'Diarmid to the parish of Callander, Dunblane. The Rev. R. Reid to the church of Lochs, Ross, vacant by the transportation of the Rev. R. Stewart to the parish of Auchnacle, Mull. The Rev. J. Gillan to the church of Alford, Aberdeen, vacant by the death of Dr. Farquharson. Dr. J. Crombie to the church of Scone, Perth, vacant by the transportation of the Rev. J. Craik to a church at Glasgow. The Rev. H. Taylor to the church of Westruther, Berwick, vacant by the resignation of the Rev. J. Crosbie. The Rev. W. Low to the church of Lochlee, Forfar, vacant by the admission of the Rev. A. Tod to the church of Monifieth, Dundee.

Fine Arts Commission.—Her Majesty's Commissioners have given notice that the decorative works intended for exhibition, according to the notices published in June and July last, are to be sent to No. 20, King-street, St. James's (late the St. James's Bazaar), between the hours of ten and five on any day, Sunday excepted, during the first week in March next, when agents will be in attendance to receive them; but no work will be received after the 7th March.

Foreign.

FRANCE.—On Monday, in the Chamber of Peers, the Duc de Broglie read the draft of the address drawn up by the commission in reply to the King's speech. The principal passage, and the one which most directly concerns this country, was the following:—"Peace reigns abroad, and there is every prospect of its duration. The relations between France and the foreign Powers are on a benevolent footing: we congratulate your Majesty on that result. A sincere friendship unites you to the Queen of Great Britain. A happy understanding has been established between your Government and hers; in presence of the events now passing in Spain and Greece that harmony was desirable. Our policy with regard to those two countries has ever been generous and disinterested; it must not be altered. We entertain for them a real affection; may they after so many convulsions, enjoy tranquillity and order: may royalty find in those friendly nations, and in its alliance with public liberties a new principle of power and stability." The address made no direct allusion to the Duc de Bordeaux, but after the Duc de Broglie had concluded, the Duc de Richelieu rose and entered into some explanations respecting his late visit to the Prince in London. He was, he said, a peer in 1830; he took the oath at that time to the new Government, and had never violated it. If he had gone to London to pay his respects to an unfortunate Prince, he merely considered that he was accomplishing a duty of honour, and rejected with indignation all idea of having been influenced by any criminal intention. M. de Boissy next ascended the tribune, and spoke of the right of search, and asked M. Guizot if he had obtained satisfaction for the violence offered to French fishermen by English cruizers who had fired upon them and killed one of them without giving them any previous notice? M. de Boissy next challenged M. Guizot on the supposed intention of the Ministry to present a dotation-bill, which he had reason to know had been decided on in the Council. M. Guizot replied that a French fisherman had been actually killed at Newfoundland by a shot fired by an English officer; that this unfortunate occurrence had given rise to a long negotiation, and that the English Government on inquiring into the circumstances which had occasioned that deplorable event, had found that the officer was to blame, and had granted a pension to the family of the deceased. M. Dubouchage and M. de Veyrac afterwards addressed the Chamber. The latter presented the vindication of the 2,000 or 3,000 Frenchmen who had visited the Duc de Bourdeaux amidst the murmurs of the assembly. M. Guizot stated that the Government had for several years kept a watchful eye over the movements of the Duc de Bordeaux; that when the young Prince had repaired to Vienna, Dresden, and Berlin, where France had ambassadors, remonstrances had been made against his presence there, which were immediately attended to by the Governments of Austria, Saxony, and Prussia. When the Duke proceeded to England, M. Guizot was aware that in a country enjoying liberty and publicity to such an extent the Government had not the same means of repression as elsewhere. He nevertheless had addressed a note to the English Government, by whom it was received in a manner that responded to his expectation. The Queen of England refused to receive the Duke, and thus gave him a signal mark of her disapprobation of his visit and sojourn in her dominions. Encouraged however by the toleration they experienced in that free country, the Legitimatists had indulged in scandalous scenes which excited the attention of the French Government. It again applied to the British Cabinet, who protested its regret at not being armed with sufficient legal means of repression, but at the same time it manifested its displeasure in unequivocal terms to the authors of those scenes and left nothing undone to convince them of its dissatisfaction at their criminal proceedings. The speech of M. Guizot was most favourably received by the assembly. M. de Boissy who spoke next, compared the emigration of M. Guizot to Ghent in 1815 with the recent visit of the Legitimatists to Belgrave-square and pronounced the former to be far more criminal, inasmuch as it had taken place in time of war and on the eve of a battle that had proved so fatal to his country. When he had concluded the President announced that the general discussion was closed and read the first paragraph of the address which was adopted without opposition. The second paragraph was voted after a few words from the Minister of Finance, who assured the Chamber that it was not a mere promise which the King's speech held out, but a positive assurance that the receipts and expenditure would be balanced in the budget of 1845. M. Segur Lamoignon having asked M. Guizot if he had opened a negotiation with England for the revision of the right of search, M. Guizot replied that when he deemed the moment opportune he had directed the attention of the British Government to that subject and after much difficulty had succeeded in inducing it to consent to a re-examination of the treaties of 1831 and 1833. The negotiations were still pending, but he had every hope of bringing the matter to a satisfactory conclusion. M. Dubouchage asked M. Guizot if it was true that the English had taken possession of the harbour of Diego Suarez on the coast of Madagascar? M. Guizot replied that no information on the subject had reached his department or that of the Marine. After a few words from M. de Boissy on the affair of the Marabout slave-ship, the third paragraph was carried, with an amendment in favour of Polish nationality. The remaining paragraphs were afterwards agreed to, and the address was voted by a majority of 115 to 14.—The Chamber of Deputies will not commence the debate on the address till the 16th. M. St. Marc Girardin is appointed to draw it up.—An incident occurred on Saturday in Paris which at any earlier period would have caused alarm. A body of students amounting to 500 or 1000, for their number is variously estimated, repaired in procession from the School of Medicine to the house of M. Laffitte, when they complimented him in the name of "the schools" on the "patriotic" speech with which he had marked the termination of his accidental presidency of the Chamber of Deputies, on his conduct during the restoration, and his successful efforts to overthrow it. &c. M. Laffitte returned "an appropriate reply," on receiving which the students proceeded to the residence of M. Beranger the poet, at Passy, delayed on the way by a row with the police, who arrested some of the most tumultuous of the body. The poet being abroad, another row with the police took place and fresh arrests were made before the students were dispersed.—Accounts have been received from China announcing the reception of the French Mission under Count Ratti Menton by the Viceroy of Wampoa. After the usual ceremonies the French Consul presented to the Imperial Commissioner a letter from M. Guizot, requesting for France the same advantages as had been granted to England. The Imperial Commissioner replied verbally that as the Chinese Government had acted so generously towards England, notwithstanding their ancient and recent differences, the Imperial Government did not think it could be less amicable as regarded France.

SPAIN.—We have accounts from Madrid to the 4th inst. Mr. Bulwer had just had his first interview with M. Gonzales Bravo, and the friends of the new Ministry affirmed that the result had proved satisfactory to both parties. He had also had an interview with the Queen and presented his credentials. The arrival of the Queen Mother was much talked of, the general belief being that she would venture to return to Madrid next month. The capital was tranquil, and no unfavourable tidings had as yet been received from the provinces. On the 31st the Government promulgated a decree, regulating and reorganising the Ayuntamientos or corporations throughout the kingdom. This is the same law which in 1840 drove Queen Christina from Spain, and against which 15,000 petitions were presented. From that time no Minister has ventured to reproduce the law in the Cortes; but General Narvaez and his Cabinet have enacted it by royal decree, without consulting either the legislature or the country. The Progresista Deputies, 71 in number, had adopted a series of resolutions, proposed by the committee they had appointed to submit to them its opinion upon the line of conduct which they ought to pursue under existing circumstances. They acknowledged the right of the Government to suspend the session of the Cortes; but were determined at the same time to keep a close watch over the ulterior proceedings of the Ministry, and see that the Constitution was faithfully executed. They accordingly wished to impress on their constituents that the first guarantee of public liberty consisted in not paying any tax or contribution which was not authorized by a vote of the Cortes. M. Martinez de la Rosa had been officially appointed Ambassador at Paris, and was to leave for that capital on the 7th or 8th of this month. On the 28th in the evening some of the individuals most implicated in the attempt on the life of General Narvaez escaped from prison. The soldier on guard at that hour is stated to have been arrested.—Advices from Barcelona of the 5th inst. announce that the capitulation of the fort of Figueras was agreed to on the 30th ult. between the Baron de Meer and Ametler. The terms of capitulation are reduced to three articles:—The soldiers and the free corps to serve for eight years in the army; the chiefs to resign their military character; and all damage done to private property by the fort to be paid by the insurgents. It appears that though these terms were sent to Madrid for the approbation of Government, the Captain-General thought it afterwards desirable to accept them on his own responsibility in consequence of a dispute among the insurgents themselves, which gave him a favourable opportunity of taking possession of the fort.

PORTUGAL.—The annual ceremony of opening the Cortes took place on the 2d inst. by the Queen in person. After the usual etiquette was gone through her Majesty delivered the following address from the throne:—"It is with delight I behold reunited in this honourable place the representatives of the nation, who by the fundamental law of the realm are invested with the noble character of the legitimate interpreters of the wishes and opinions of the nation. Impressed with the desire of becoming acquainted with the necessities of my people, I left the capital for a few weeks accompanied by my august spouse and two of my children, on a visit to the principal towns and places of Alemtejo and Estremadura; and I trust that this digression will have been of utility towards the furtherance of the happiness of the people of those districts, of whose love and respect for my Royal person I am delighted to be able to give in this place a public testimony. Since the solemn opening of the last legislative session, Providence has been pleased, by the birth of a Princess, to grant a still further security to the throne of these realms. I have the satisfaction to announce to you that I continue to receive from all nations (my allies) the most undeniable proofs of friendship, and I am fully confident that the negotiations with the Holy See will be shortly terminated, the privileges of the Crown held sacred, and the necessities of the Lusitanian Church attended to. It is moreover with the greatest delight that I am enabled to assure you that the public tranquillity has not suffered the slightest alteration in any part of the kingdom. In the organisation of the land and naval forces you will bear in mind the interests, honour, and security of the nation. In conformity with the constitutional charter of the Monarchy the budget for the future economical year will be presented to you; upon this important object, as well as upon other different branches of the public service, my Ministers will furnish you with such proposals as may be judged most convenient and which experience will have shown are most necessary. I have the highest confidence that these Chambers will give every assistance to my Government. I am led to expect this from their zeal and interest for the public welfare."—Señor Olozaga arrived in Lisbon towards the end of the last month, and was residing on the 1st in one of the suburbs of that city. The late Ministerial crisis has terminated in the refusal of the Queen to accept the

...ersation of her Prime Minister—her Majesty's subse-...t proposal to him to form a new Ministry—his ...ing to do so, and his reconciliation with his col-...gues. The continuance of the Ministry has been marked ...y her Majesty's especial favour conferred on the Prime ...ister by his elevation to the dignity of a Councillor of ...e. The existence however of the present Ministry as ...s now constituted, notwithstanding its large majority of ...votes in the Chamber of Deputies and its influence over ...the troops, is said to be very doubtful.—Dr. Kalley, after ...suffering an imprisonment of four months in Madeira, has at length been released on bail.

GERMANY.—The King of Prussia has been pleased by a Royal ordinance, dated on Christmas-eve, to revive the Order of the Swan, the most ancient of the Prussian Orders, founded in 1443 by the Elector Frederick II. This is not an Order of Knighthood but a Christian association, the members of which are to be of both sexes and of every branch of the Christian Church, and the object the promotion of any work of Christian charity on a great scale, mindful of the words of our Lord—"By their fruits ye shall know them."—A treaty has just been agreed to between Prussia and Austria for uniting the railroad of Upper Silesia, now in a state of construction, to that of the Emperor Ferdinand, by means of a branch line passing from Gleinitz to Neumuntz in Austria near the Prussian frontier. This line of about 32 French leagues in length is to be completed in five years, the period when the Emperor Ferdinand's is to be finished. In consequence of this arrangement it will be possible after some time for travellers to go by railroad the whole way from Hamburgh to Trieste.—The *Suabian Mercury* states under the head of Darmstadt that M. de Haber who recently killed M. Sacharaga in a duel intends to surrender to take his trial at the assizes of Alrey. His extreme punishment if found guilty will according to law be three years' imprisonment in a fortress.

DENMARK.—A letter from Copenhagen of the 29th ult. states that the King had issued an order for the state-councillor M. Hansen, civil governor of the Danish possessions in the East Indies, to proceed to China and obtain exact information of the modifications which the trade of that kingdom has undergone since the peace with England. The ultimate object of this step is to extend the commercial intercourse between China and Denmark, and the merchants of Copenhagen have been invited to communicate any suggestions likely to facilitate M. Hansen's mission.

GREECE.—Accounts from Athens of the 21st ult. state that the address on the speech from the throne has been adopted by 179 to 11. Some amendments proposed by a small opposition which demanded particular mention of the 15th September were rejected by immense majorities. The address, drawn up it is said by M. Zographos, seeks to conciliate the monarchic and democratic parties. It proclaims "the gratitude of the Greek people on that day, when his Majesty accepting the vows recently expressed, proclaimed the system of a national representation as a treaty between Prince and people, consecrating irrevocably the rights of the one and the prerogatives of the other. The representatives," it says, "altogether participating in the desires of his Majesty and his wishes for the national happiness will not be sparing of the just concessions necessary to attain this end. They will exert all their efforts to put the fundamental laws of the Constitution in harmony with the true necessities of the Greek people, and render it worthy of the hopes of the civilised world, as well as to present monarchy in all its force, surrounded by the respect due to it, in reserving for the throne all the rights necessary to protect the just interest of each and the general prosperity of the nation." The rumours of disturbances at Athens noticed in our last on the authority of a Malta letter, appear to have been well founded. The German papers state that an attempt was made on the 11th to fire the hall of the National Assembly, and the office of the Foreign Affairs has been burnt with its papers and archives, the destruction of the latter being, perhaps, the aim. It is also said that the lady of the Bavarian Envoy was attacked in her carriage. The German papers recently announced that the Emperor of Russia had declared he will never renew his relations with Greece until those who took part in the revolution of the 3d September are punished. The National Assembly, to mark their indignant sense of this menace, have passed a unanimous vote, granting to all the Officers and men who were in the capital, and engaged in the movement, pecuniary privileges and other immunities, which they, in a spirit of patriotism, have declined.—The *Gazetta delle Isole Ionie* contains the following article:—"A ship under Turkish colours, coming from Bengasi, and bound to Candia, arrived on the 14th November in the harbour of Zante. On board there were three Mahometan merchants, who, having purchased slaves in the market of Bengasi, intended to convey them to other places in hopes of great profit by this inhuman traffic. The Government being informed of this fact, has, by virtue of the power given it by Act 11 of the second Parliament, declared the slaves to be free, and has given up the ship to the Turkish Vice-Consul."

TURKEY.—Letters from Constantinople state that on the 18th inst. a deputation of the dragomans of the five great Powers were admitted to an interview with the Minister for Foreign Affairs, from whom they demanded explanations relative to the execution of the Greek at Biledjik, noticed in our last. They were very well received by Rifaat Pacha, who expressed on the part of his Government the deepest regret at what had taken place, which he assured them "was to be attributed to no premeditated design, but to inadvertence in the conduct of the beylikdjee or registrar. That functionary had been dismissed from office, and he trusted the Cabinets of the friendly Powers would feel satisfied with this proof of the Porte's sincere desire to cultivate a good understanding with them." The question of the re-union of the Patriarchate of the Fanar with the Hellenic Church has been submitted to the Porte with a view of obtaining its concurrence to that important measure. The Turks, under the belief that they might through this channel exercise a salutary influence over Greek policy, are described as being at present disposed to encourage these views.—From the Danube we learn that the government of Moldavia, wishing to reduce the number of Jews residing in the country, has just adopted severe measures against persons of that persuasion. For the future no Israelite is to be admitted into the country without a regular passport, and in case of contravention the offender is to be sent to the salt-mines of Okna. The names of all Jews arriving each day in a town are to be sent to the authorities. Permission will be required to enable a Jew to reside, and any person of that body not sending in regularly the address of his place of residence will be punished as a vagabond. This order has been communicated to the various consuls, to be by them forwarded to their governments.

WEST INDIES.—The Clyde packet has arrived, bringing with her the West Indian and Mexican mails. She has a large amount of specie on board and 72,000*l.* on account of the Mexican April dividend. The latest dates are Jamaica 9th December, Trinidad and Demerara 5th, and St. Thomas's 17th. Bills had passed the House of Assembly of Jamaica for making a railroad between Kingston and Spanish-town, for allowing a specific salary to the Attorney-General of that island, and for taking a census of the population, which has never been taken, it is said, before; the extent of the free population being all conjecture, and the increase not ascertained since the termination of slavery. Alluding to the late speech of Sir R. Peel to the agriculturists of Tamworth, the *Jamaica Morning Journal*, a Conservative paper, says that the advice given to the farmers of Great Britain might be given with equal propriety to the sugar-growers in the West Indies. "To them we might say, depend upon yourselves alone—study agricultural chemistry so as to defy competition." The same paper tells its readers that they may depend upon it, "notwithstanding the peculiarity of their position as regards negro emancipation they must soon submit to the free-trade doctrines which at present are so fashionable and so much in the ascendant." The Governor, Lord Elgin, continued to exhort the planters on the subject of agricultural improvement, and with good success. His Excellency has again offered prizes for the best essays on the cultivation of the cane and for a scheme of industrial education. "With steam and machinery," says the *Jamaica Dispatch*, "there is no telling to what extent the rich resources of the island might be developed, and ploughs and a steamboat are already in action." In Barbadoes the same complaint of dry weather and want of rain is expressed, and at St. Vincent's and St. Thomas's the small-pox had made its appearance. An affair of the Roman Catholic Bishop Clancy occupied the attention of the public at Demerara, and at Trinidad an endeavour was being made to assimilate the bankruptcy and insolvency laws to those now in force in England.—The news from Mexico is somewhat important and interesting, inasmuch as it appears that Santa Anna is re-elected President for a term of five years. On the 13th of November he visited Vera Cruz, had the troops drawn up in the square and harangued them. He stated that he had arrived for the purpose of inspecting the fortifications, that war with England was inevitable, that he was determined to support the honour of his country to the fullest extent, and would defend the Castle of St. Juan d'Ulloa in person and would resign it only with his life. As soon however as he was re-elected President, he took his departure without any further notice of the troops and the whole affair was regarded as an electioneering manœuvre.—A paragraph has appeared in the Mexican papers, stating that President Santa Anna had directed suitable buildings to be erected to accommodate the State prisoners, whose labour he proposed to employ in the construction of a canal across the Isthmus of Tehuantepec. The isthmus is in Mexico, partly in the province of Oaxaca and partly in that of Vera Cruz. The river Guassacualco empties into the Atlantic at that point, and it is supposed may be rendered navigable for large ships to such a distance from its mouth as to leave only about 45 miles of intervening land between the head of ship navigation and the Pacific Ocean. Santa Anna's project is nothing less than to cut a canal across this isthmus, and thus open the path to commerce from one ocean to the other.—Some remarkable ancient ruins have been recently discovered in the department of Oajaca. In reconnoitring the district of Teotitlan, in order to ascertain the best route for a road, the surveyor, Rafael Villa Gomez, came upon "the ruins of a great town" (poblacion). It had been only partially explored at the date of these advices, but the ruins of more than 100 houses had already been observed, and the guide said the principal edifices were still beyond. These ruins are called "The Palaces of Mitla." They are said to exhibit a style of architecture altogether unlike the styles known in art either ancient or modern; yet they are not wanting in just proportions, symmetry and beauty, which give splendour and grace to the whole, as well as to the parts. This ruined town must have been built by a race which preceded the Mexicans, either by the Indians or a people still more remote.

BRAZILS.—The Crane packet has arrived with news from Rio to the 23d Nov., from Monte Video to the 28th, and from Buenos Ayres to the 13th Oct. Nothing material had occurred as to the blockade or siege of Monte Video by the troops of the latter, except that all the houses of business were closed, and great excitement still prevailed. The Dolphin schooner, Lieut. Hoare, had captured a large brig slaver with 570 slaves on board, and the Curlew was about to proceed with her to Demerara. Their Imperial Majesties and the Princess Januaria had made an excursion into the interior for the benefit of the latter's health, which had improved considerably from the change of air.

NEW ZEALAND.—A correspondence has appeared in the daily papers between Col. Wakefield, principal agent of the New Zealand Company at Wellington, and Mr. M'Donough, the police magistrate, which rectifies an important error committed by Mr. M'Donough in his address noticed in this Paper last week. Col. Wakefield in his letter, dated July 13, 1843, says—"My attention has only this moment been called to an address published by you to the British settlers in Cook's Strait, relative to the late affair at Wairau, in which you declare your conviction that the affray was not the result of premeditated design on the part of the natives, but that on the contrary they sought by every means to avert it, and did not fire a shot till five of their party had fallen, including the wife of Rangiaiata, who at the moment bore his own son in her arms. As you have now received authentic information from the depositions taken by the magistrates at Cloudy Bay in corroboration of Mr. Tuckett's evidence, which you then had 'that after an accidental shot from a white man a volley was discharged from each party,' I trust you will see fit to correct the statement in your address. Sanctioned by your official character it is calculated to have weight with the public in England, and to greatly distress the relatives of our unfortunate countrymen who have fallen, and who it is distinctly proved had no intention of commanding an unprovoked attack upon the natives, as implied in the passage of your address which I have quoted." Mr. M'Donough in reply says:—"At the time I published the address it was my firm belief from all information I had then been able to collect that everything therein contained were facts. However, from the depositions taken by the magistrates on the spot, which documents have since been placed in my charge, I find from a more careful perusal of them that I had been misinformed on the following points, namely—that five of the natives had not fallen previous to their returning the fire; neither does it appear at what period of the conflict Rangiaiata's wife was accidentally shot, who it is proved had not at the time an infant in her arms. I likewise find by those documents that no order was given by the Europeans to fire on the natives, but that the general conflict originated from an accidental shot of one of the European party."

UNITED STATES.—The New York packet-ship Liverpool arrived at Liverpool on Wednesday night, bringing New York papers to the 22d ult. She made her passage in 18 days. In Canada it is the intention of the Governor-General to form merely a provisional and temporary council, to be composed of Messrs. Daly, Draper, Viger, and one or two other gentlemen unconnected with politics, until more permanent arrangements can be made. Messrs. Lafontaine, Aylwin and Morris have already returned to their homes. It is expected that the official papers of the former will be handed over to some confidential member of the Lower Canada bar—and that Mr. Draper, as Queen's Counsel, will take charge of Mr. Baldwin's papers, so that the late ministry may be said to be relieved of the seals of office. It has been decided that no salary shall in future be attached to the office of Executive Councillor. The news from the United States is chiefly commercial and would have but little interest for the general reader.

CITY.

Money Market, Friday.—Consols for the opening closed at 96⅜; Three per Cents. Red., 97⅝ to ⅞; Three-and-Half per Cents., Red., 102¾ to ⅞; New Three-and-a-Half per Cents. 101⅛ to 2; Bank Stock, 186; Exchequer Bills, 65 to 67 pm.

Metropolis and its Vicinity.

The Parks, &c.—The Report of the Commissioners of Woods and Forests just published contains the following under this head:—"It having been deemed expedient that the Crown should possess the freehold of the property to a certain distance immediately eastward and westward of the new entrance from the Knightsbridge-road into Hyde Park (now called the Albert Gate), for the purpose of obtaining and exercising a controlling power as to the style and character of the buildings to be erected on the ground adjacent to that new entrance, we have to report that agreements have been entered into for such intended purchases, and for letting to Mr. T. Cubitt the disposable building-ground eastward and westward of the new entrance. We have also to report that, under the powers given by the same act, we have agreed for the purchase of the three houses in the High-street at Kensington required for the opening of the intended new communication between Kensington and Bayswater; which not only forms an essential part of the plan for letting for villas the site of the late Royal kitchen-garden at Kensington, but will be a great accommodation to the rapidly-increasing population in that district. In furtherance of that plan, a new sewer for the drainage of the intended houses has been nearly completed; but owing probably to a very great suspension of building speculations which has existed during the past year, we have as yet agreed to let only two out of the 33 sites designed for new buildings to be erected on this ground. It was mentioned in our last report, that the value of this ground to be let on building leases would be sufficient to form a fund for acquiring and establishing a new kitchen garden, to

be attached to Windsor Castle, as well as for the improvement of other Royal kitchen gardens; and that approved plans for forming such new kitchen garden on part of the Crown's estate at Frogmore were then in progress. Under the act which authorised these arrangements, the monies required for "forming, improving, laying out, planting and inclosing this new Royal kitchen garden, and in erecting, making and completing all requisite houses, buildings, walls, sewers, drains and other works connected therewith," have in the meantime been defrayed out of the land revenues of the Crown, as the funds to arise from the value of the late kitchen-garden at Kensington have not for the reasons before mentioned yet become available for this service. The new bridges for connecting the Regent's Park with that portion of the Primrose-hill estate which under the authority of the 5th and 6th Victoria, c. 78, we had lately purchased from the provost and fellows of Eton College, having been completed and open to the public since the date of our last report, we are now in negotiation with the lessee of the college with a view to the purchase of his interest, which will not expire till the year 1859; and if we fail in obtaining such terms as shall appear to be reasonable it is our intention to avail ourselves of the powers of the act in question to have the value assessed by a jury. Since the passing of the act of 4th and 5th Victoria, cap. 27, which vested in us all the requisite powers for acquiring the lands intended to form a new park in the eastern part of the Metropolis, we have agreed for the purchase of the freehold interests in 101 acres out of 290 acres comprised in the plan, and authorised by the said act to be purchased for forming such new park; and having given the proper notice to all the parties whose lands or interests will be required, we are proceeding as expeditiously as possible to complete the purchases of all the still outstanding freehold interests, before we begin to deal with those of lessees, sublessees, or occupiers; and for the present the monies set apart for this service remain invested in Exchequer-bills."

British and Foreign Institute.—The daily papers announce that this Institute is to be honoured at its opening with the presence of Prince Albert, who has consented to become its patron. His Royal Highness granted an audience to Mr. Buckingham on Monday at Windsor on the subject, but the opening will be deferred till the return to town of the President, the Earl of Devon, which is expected to be about the meeting of Parliament.

Church Extension.—On Monday Archdeacon Sinclair laid the first stone of the new church of St. John's, Kensington. The site of the church is on an eminence opposite to Notting-hill, and commands a view of the surrounding country. The building will be in the Gothic style, and if the funds prove sufficient will include a tower and spire. Provision will be made for the accommodation of 1500 persons. On Sunday last the Archdeacon opened for divine service the New National School-rooms in the potteries of Kensington, preparatory to the erection of another church for the north-western portion of the parish.

St. Stephen's, Walbrook.—During the delivery of the Rev. Dr. Croly's sermon on Sunday morning, a person who occupied one of the centre seats in the church suddenly rose and exclaimed, "It's all a delusion, it's all a delusion; I'm ashamed of you, Sir, for uttering such falsehoods." The congregation was astonished, and rose in a body to find out the intruder. The Rev. Doctor was alluding to the state of the new year, and to the happy state of the country under the reign of the Queen. One of the parishioners immediately removed the offender from the church and gave him into custody.

Anti-Corn-law League.—The Marquess of Westminster has addressed a letter to the chairman of the League, inclosing a donation of 500*l.* to the fund. His Lordship states that his hopes of ultimate triumph, and that at no very distant date, much exceed his fears of failure. "As to the duty that it is said would be lost to the country," he says, "I am satisfied that such would be the prosperity of all classes from the abolition of this impost, such the advantage that would accrue to all the monied concerns of the community, that in a very short time the general wealth would be so far augmented that the national revenue would outrun the amount of any duty that has been proposed, whether 3*s.*, 5*s.*, or 8*s.* It may be all very well at agricultural meetings to talk of the advantages of long leases, of tile-draining, &c. and to drink the health of the labourers; but to what good effect? Long leases are in certain districts and under certain well-known circumstances desirable enough; good draining has long been understood and practised where there have been sufficient means, sufficient enterprise, and a soil requiring it; praise has no doubt been deservedly lavished upon the farm-labourers; but there is something still to be done much more important to them, which is to give them the means of obtaining an honest and independent livelihood, solid pudding being far preferable to empty praise, and this cannot be effected without the abrogation of these mischievous enactments. I have much pleasure in sending a contribution of 500*l.* to your fund; and I venture to express a hope that you will not relax your endeavours until you have obtained from Government, in whatever hands it may happen to be, the fullest measure of free trade compatible with what is due to the maintenance of public credit."

The Deputy-Coroner for Middlesex.—A correspondence has appeared in the daily papers between two reporters for the press and Mr. G. I. Mills the Deputy-Coroner in reference to a report of the late inquest on Col. Fawcett. The first letter of the reporters asserted that Mr. Mills had claimed and received from them a certain sum of money, for furnishing a report of the proceedings at an adjourned inquest held by Mr. Wakley touching the death of Col. Fawcett, and from which all reporters had been excluded. That assertion rested on a letter written by Mr. Mills himself, in which he also claimed for any further information which he might afterwards supply, the full half of whatever sum the reporters might receive for the reports of inquest proceedings furnished by him. Mr. Mills in reply says that the reporters have attempted to fix a stigma upon his character by stating that he had, for a remuneration, furnished to them while Deputy-Coroner for Middlesex, an account of proceedings which had taken place at an adjourned inquest in July last. To that statement he replies—"I was not deputy-coroner, and no such office was in existence until one month after the date of the inquest in question." He also states that—"At the adjourned inquest referred to no judicial inquiry was prosecuted, and not a single witness was examined." These are all the material parts of the letter, and there is not a word said about the money part of the affair. The reporters reply that they did not accuse Mr. Mills of having taken money for reports furnished by him as deputy-coroner, and add that "the date of the inquest was sufficient to show that he was Mr. Wakley's clerk, and not his deputy at the time." They still contend, however, that Mr. Mills claimed the half of whatever money they might receive for reports furnished by him, and allege that the proposition to share the profits was made by Mr. Mills and not by them. They admit that they were wrong in listening to that proposition, but excuse themselves on the ground of their anxiety to obtain every possible information relative to the duel between Colonel Fawcett and Lieut. Munro.

South Sea Company.—At the General Meeting of this Company last week, the recommendation to make the transfer days of the stock and annuities the same as at the Bank, viz., Tuesday, Wednesday, Thursday, and Friday, was adopted. The Sub-Governor stated that a letter had been received from Sir J. Graham in reply to the address voted at the last court. The purport of it was, that he could not advise Her Majesty to accept the office of Governor of the Company. The deficiency to be supplied for the half-year was stated to be 4471*l.* 9*s.* 1*d.*, which must be paid by Government.

New Statues.—The equestrian statue of George IV., at the north-east angle of the terrace in Trafalgar-square, was uncovered a few days since, the stone pedestal cleansed, and the statue itself exposed to view. Sir F. Chantrey has represented the King in a large military cloak, his head uncovered, and holding a roll in his right hand. He is represented riding without stirrups on a horse of the Arab breed, which is not in action, but stands with his four feet upon the ground. The statue of George the Third is shortly to be removed from Cockspur-street to the N.W. angle of the square. Mr. Joseph's statue of Sir David Wilkie has also been placed at the foot of the staircase in the vestibule of the National Gallery. It represents Sir David in an attitude of contemplation; in the right hand which crosses the breast is a pencil, whilst the left holds a book of designs or drawings. The figure is in a modern costume, the angles of which are kept down; and the whole is rendered classical in its appearance by a cloak, or robe, which falls in broad folds over the shoulders. The likeness is correct, but somewhat idealized and flattered.

London Joint Stock Bank.—At the half-yearly meeting of this Bank, which took place on Wednesday, a dividend at the rate of 6 per cent. was declared, to make up which, however, it was found necessary to deduct 1,529*l.* 3*s.* 4*d.* from the guarantee fund. It appears that the profits amounted to 16,470*l.*, a sum so little short of that requisite for the dividend that the directors felt themselves justified in again trenching upon their reserve, as the interest upon that fund, now about 100,000*l.*, nearly replaced the amount they had withdrawn. In the course of the business the question of the expediency of discontinuing or reducing the rate of interest allowed on the *minimum* balance of current accounts was introduced and ultimately referred to the consideration of the directors, who stated that they had already given it their best attention. The sum paid during the last year as interest on these accounts was from 19,000*l.* to 20,000*l.*, and the great argument in favour of a reduction in the rate was the present low value of money, and the accession that the saving would make both to the dividend and guarantee fund.

Popular Education.—The Dissenters held their first meeting since the abandonment of the Factories Education Bill on Wednesday evening at Marlborough Chapel, Old Kent-road; Mr. B. Wood, M.P., in the chair, supported by Mr. Hawes, M.P., Mr. M. Gibson, M.P., Dr. Bowring, M.P., and several ministers of various denominations. It was determined to erect schools in the Old Kent-road and New Peckham on the British and Foreign School Society's plan, towards which Mr. Wood subscribed 50*l.*

Murder and Suicide.—On Tuesday evening the parish of St. Paul, Deptford, was alarmed by the discovery of a murder in Giffen-street, Deptford. It appears that a tradesman, Mr. John Fawley Dickenson, returned home from London soon after five o'clock, having been in town all day on business, when on going into the parlour to meet his wife and children, he found her with her throat cut but still alive, and on getting a light he discovered his two children (aged 18 months and three years) lying at their mother's feet, with their throats so dreadfully cut that life must have become almost immediately extinct. The police immediately sent for the parish-surgeon and another gentleman, who sewed up the wound in the woman's throat and bandaged it. By this time the churchwardens had arrived and searched the place, and after some time they found a razor covered with blood. The father of the children recently carried on the business of a licensed victualler at Parson's Green, Fulham, where it is understood he was unfortunate. His wife's maiden name was March, and she formerly lived at Kensington. She confessed at once to the police that she had committed the crime, and the Coroner's Jury have returned a verdict of Wilful Murder against her.

Humane Society.—On Tuesday a general meeting of this society was held in Trafalgar-square, Admiral Sir E. Codrington presiding. From the report it appeared that the receipts for the past year amounted to 2503*l.*; the disbursements to 2253*l.*, leaving a balance of 250*l.* The number of cases of recovery from drowning which had come under the committee's notice during the past year was 170, rewards having been distributed among 151 persons. The Secretary announced that about 12 months since a prize was offered by the society for the best essay on the resuscitation to life of apparently drowned persons. Five essays had been received which had been submitted to the inspection of two medical gentlemen, but on investigation it was found that they did not contain any new suggestion, but were compilations from previously published works. After some discussion on the subject Mr. Baron Gurney proposed a vote of thanks to the Duke of Northumberland for his patronage of the society. Mr. Hawes, M.P., seconded the resolution, which was carried unanimously. The meeting next proceeded to consider the cases referred by the committee as deserving of reward, and in each case that was deemed suitable the society's silver medallion was awarded.

Fires.—On Monday morning about 1 o'clock a destructive fire broke out in the store-rooms belonging to Mr. Rolls, floor-cloth and table-cover manufacturer, japanner, &c., near the canal-bridge in the Old Kent-road. Our readers will remember that this is the third fire that has happened upon these premises within the last twelve-months. The store in which the present fire originated was a very capacious one, possessing sufficient room for drying at least 60 pieces of prepared goods of 12 yards each in length. It is situated in a line with another store, and the printing-room is contiguous to it. From the inflammable character of the materials the fire obtained such a hold of the japan store and its contents that nothing it contained could be rescued. The exertions of the firemen were consequently directed to the rescue of the buildings north of the store in which were suspended many pieces of table-covers and other stock, besides a considerable quantity of japan mixture, oils, &c. Fortunately the fire was confined to the building in which it originated. The roof fell in shortly after the outbreak, and not a particle of the property in the store was saved.—On Thursday night fires broke out in the residences of Sir W. Curtis in Portland Place, and the Marquis of Anglesea in Old Burlington Street, but they were subdued in both cases before much damage was done.

Mortality of the Metropolis.—The number of deaths registered in the week ending Saturday, Dec. 30, was as follows:—West Districts, 124; North Districts, 184; Central Districts, 225; East Districts, 232; South Districts, 242; Total, 1007 (males, 516; females, 491). Weekly average for the last five years, 903 (461 males, 442 females); and for the last five autumns, 908.

Provincial News.

Incendiary Fires.—The following property has been destroyed since our last report:—On Tuesday night at March, near Cambridge, a large thatched barn, the property of Mrs. Barton. On Wednesday, part of the stack-yard of Mr. Seekings, of St. Ives. On Monday, at Bluntisham, several stacks and a barn containing corn, in the homestead of Mr. Asplen. On Sunday, at High Halstow, Kent, several stacks of oats and beans, on the farm of Mr. W. Allen; a young lad nine years of age has confessed that he was the incendiary, and has been committed for trial. On Friday, near Bishop's Waltham, Hants, on the farm of Mr. Houghton, four large wheat-ricks, three barns full of oats, barley, and wheat, the whole of the stabling and other buildings. On Monday, near Manuden, Essex, a large stack of oats on the farm of Mr. Bush. On Wednesday the 27th ult., at Billinghay, near Sleaford, Lincolnshire, a straw-stack on the premises of Mr. Bailey. On Saturday, near Hylton Castle, Northumberland, a rick of hay in the stackyard of Mrs. Spraggon. On Sunday, at Langham, near Oakham, some premises on the farm of Mr. Mantle. On Monday the 1st, at Moulton, Lincolnshire, a hay-stack on the farm of Mr. W. Savage. On Thursday at Stansted Mountfitchet, Essex, an outhouse adjoining the corn-barn of Mr. E. Hicks; and on the same night at Banfield End, a barn containing wheat, a cowhouse, with a chaise and several carts belonging to Mr. W. Clarke, entirely destroyed.

Ashton-under-Line.—A meeting in favour of free-trade was held in this town on Monday, Mr. Hindley, M.P., in the chair. The meeting was addressed by the Hon. C. P. Villiers, Mr. Cobden and Mr. Moore, after which various subscriptions to the great League Fund were announced, amounting altogether to 4338*l.* 2*s.* 4½*d.*

Barnsley.—The local papers mention as a proof of the improvement in trade, and the better condition of the working-classes, that at the close of Saturday's market at Barnsley, preceding Christmas, every butcher's shop and stall was cleared of its contents; in fact the supply of beef was little above half equal to the demand.—On Monday a meeting of several hundreds of colliers took place in this town. The principal speaker on the occasion was a person named Holgate, from the neighbourhood of Leeds. From what could be gathered of the speeches, it is the intention of the coal-miners in England and Wales to form themselves into one great union, so that they may all act in concert at any given time for an advance of wages.

Bradford.—At one of the late free-trade meetings in this town Mr. Cobden challenged any one to dispute with him the Corn-law question. Mr. Feargus O'Connor has accepted the challenge in the following terms:—"I

undertake to meet you at an open-air meeting as near the centre of the West Riding of Yorkshire as convenience will allow, upon the first holiday that occurs, in order that the verdict may carry with it the greatest amount of popular feeling upon the subject. You shall appoint a chairman, I will appoint another, and if a difference of opinion arise the meeting shall be divided, those supporting your views going to your side of the hustings and those supporting my views going to my side of the hustings. You shall appoint a committee of seven to adjust the preliminaries on your behalf, and I will appoint a committee of seven to do likewise on my behalf."

Brentwood.—On Thursday night a desperate encounter took place between a gang of poachers who have long infested the neighbourhood and the gamekeepers of Edwin James, Esq., of Herongate near this place. The keepers three in number and the constable of the parish hastened to a wood where they had heard a gun fired, and remained secreted until the poachers came over the hedge, when the latter commenced an attack upon the keepers who were preparing for action. The keeper who first went up to them was struck by the leader with the butt-end of his gun and fell senseless on the ground, the force of the blow was such as to shiver the stock from the barrel. The second keeper rushed up and struck down the man who had thus used the gun, who in his turn fell senseless upon the other in the ditch. A general conflict took place and the keepers were in the result able to secure the ringleader, but not until severe injuries had been committed upon each party. The poachers were armed with guns and bludgeons, and evinced a determination to kill the keepers rather than be captured.

Bristol.—In the District Court of Bankruptcy on Thursday week dividends were declared on the separate estates of Hobhouse, Phillott and Lowder. Mr. Hobhouse and Mr. Phillott's private estates paid 20*s.* in the pound. On that of Mr. Lowder a dividend of 3*s.* in the pound, in addition to 9*s.* in the pound already paid, was declared. At the meeting which took place on Tuesday a dividend on the joint estate of two shillings in the pound was declared and it is expected that a further and final dividend will be paid, making in the gross 9*s.* 6*d.* in the pound. It was mentioned incidentally that the cost of the certificate (which was obtained on the 24th September 1842, shortly prior to the commencement of the operation of the new bankruptcy laws) was upwards of 600*l.*, that the number of signatures attached to it was nearly 800, to obtain which the document had to be sent to almost every part of the country. It consists of several skins of parchment and is eight or ten yards long.

Bury.—A free-trade meeting was held on Thursday week in this town which was attended by Mr. Bright and Colonel Thompson as a deputation from the Anti Corn-law League. Both these gentlemen and Mr. Walker, M.P. for the borough, addressed the meeting and resolutions sympathising with the progress of the League were passed. A subscription was then entered into, and it was announced that upwards of 1120*l.* had been contributed by Bury.

Cambridge.—The Hulsean Prize of 100*l.* has just been awarded to Mr. Charles J. Ellicott, B.A., St. John's. The subject was—"The obligation of the Sabbath, with a history of the institution and its influence from the earliest times to the present day." The subject for 1844 just announced is as follows:—"The lawfulness and obligation of oaths in a Christian community, and the influence which they have had upon society at different periods."—Mr. Crisford, many years proprietor of the Bull, one of the principal hotels of Cambridge, was found drowned in the Cam on Monday morning under circumstances which made it difficult to come to the conclusion whether his death proceeded from accident or self-destruction. A labourer perceived a hat lying on the bank near a place called the Bull Leys, a few yards from which in the river he observed a body standing upright with the water coming up barely over his head, which proved afterwards to be that of Mr. Crisford. He had his gloves on, and his coat was buttoned up to his chin. The jury could not come to the conclusion whether the deceased had thrown himself into the water or was accidentally drowned, and returned a verdict accordingly.

Cheltenham.—An inquest was held on Monday on the body of Conrad Algernon Carter, the youngest son of Mr. Giles Carter, solicitor, of Winchcomb, a promising youth of 12 years of age, who had come by his death in consequence of the severity of punishment administered to him by Mr. Lapworth, the master of the endowed grammar-school at that place. After a long inquiry, during which witnesses were called to prove various acts of cruelty on the part of the master, the jury returned the following special verdict:—"They find that the deceased died of disease of the lungs; but the jury cannot separate after returning their verdict without expressing their high sense of disapprobation of the conduct of Mr. Lapworth, the schoolmaster, towards deceased in March last, when he inflicted an extent of corporeal punishment on him which was unwarrantable, and done in a manner the most discreditable."

Colchester.—On Saturday the meeting of the Essex Protection Society was held in this town, Mr. Robert Baker of Writtle, the President of the Association, in the chair, supported by about 500 agriculturists and tenant farmers. The meeting was addressed by Mr. Barker of Ramsey, Mr. Barker of Laxton, Mr. Thos. Cooper of Ardley, Mr. Walton of Colchester, Mr. J. Rawtrey, Rev. Mr. Smithies, Mr. Fisher Hobbs, and other gentlemen, who condemned the proceedings of the Anti-Corn-Law League. Resolutions were adopted approving of those agreed to at the recent meeting at Chelmsford, and constituting a district committee for Colchester and Maningtree. The subscriptions received at the meeting amounted to upwards of 500*l.*

Deal.—On Thursday week the American ship Hercules, from New York, 500 tons burden, was wrecked near the Goodwin Sands. The crew escaped, but with great difficulty. The ship left Shields on Monday, laden with a general cargo, and was bound for New York. About ten o'clock on Thursday, while bearing through the Downs, she struck with considerable force on the Brake Sands, where she became a fixture. Every effort was made to get her off, but without effect. She began rapidly to fill, and the crew had not been many minutes in the long-boat before she went down head foremost. There is no probability of being able to raise her.

Dynas.—A fatal accident occurred in the Dynas colliery on Monday week, by which the roof of the pit was blown off, and 12 men lost their lives. From the evidence at the inquest it appeared that the disaster occurred through the neglect of the overman. It was his business to go into the pit every morning at 3 o'clock to examine all the headings and stalls, and to see if they were in a fit state to resume operations. He went down on the Monday morning accompanied by a little boy, to whom he imprudently intrusted the task of exploring a particular stall. This he but partially explored, and in this stall it was that the foul air had generated. Even the common precaution of wiring the safety-lamp was neglected, for the absence of anything like a serious accident in this colliery for years had made the parties careless. Half-an-hour later in the day when all the men would have been at work, and when the horses would have been engaged in the operations of the pit, the loss of life would have been very great. After a lengthened investigation a verdict of "Accidental Death" was returned. On the delivering of the verdict the coroner adverted in terms of strong reprehension to the conduct of the overman, through whose neglect the calamity occurred, and left it to the jury to say whether he ought not to be committed on a charge of Manslaughter. The jury however intimated that such a charge would receive no countenance from them.

Falmouth.—The *West of England Conservative* states that on the night of Saturday the 30th ult., no less than 30 persons were admitted into the bosom of the Catholic Church in this town. The parties brought their prayer and hymn books with them which they had been in the habit of using in their respective places of worship, and by command of the priest they tore them in pieces leaf by leaf and scattered them on the floor. They then read their recantation and were baptised according to the ritual of the Romish Church. This ceremony took place at 12 o'clock at night.

Guildford.—On Saturday morning Lord Grantley's keeper was found in the canal close to his Lordship's preserves, which join the house, murdered. It appears he was at the public-house at Bramley between 8 and 9 on Saturday evening, where there was a raffle for a hog, and said to the landlord he must go round his Lordship's preserves to look after the pheasants, and would return in an hour or so to take supper, since which he never was seen alive. Guns were heard about that hour in the direction where the body was found. The poor man was shot through the head, and a severe struggle evidently took place. A man named Elsley was apprehended on suspicion, and an inquest was held on Monday, when a policeman produced a statement made by Elsley in prison confessing that he was guilty. The jury without hesitation returned a verdict of Wilful Murder against him.

Hitchin.—At the petty sessions held in this town on Tuesday the prosecution of Burke, the man who was mentioned in our last as having been indicted for having killed a pony in a match against time, took place before a full bench of magistrates. The court was crowded to excess, many persons having arrived from London to be present at the proceedings. The prosecution was instituted by the Royal Society for the Prevention of Cruelty to Animals and by the Animals' Friend Society. The particulars of the case were fully noticed last week, and it will therefore be sufficient to state that the charge was fully proved. The chairman in passing sentence said: "Mr. Burke, you have been charged with having wantonly and cruelly abused a grey pony, on the 18th Dec. last. The facts were perfectly notorious to us and to the whole of the neighbourhood, but we have based our opinion not on them but on the evidence now laid before us, and the magistrates are unanimously of opinion that the case has been clearly made out. It is therefore their duty to convict you, under the terms of the Act of Parliament. There is no doubt on their minds that you have been guilty of a series of ill-usage which brings you within the act, and we have only one subject of regret, namely—that the law does not allow us to inflict a punishment that would show the disgust we feel at your conduct. You are convicted in the full penalty of 40*s.* and costs." Burke: "I shall appeal from your decision to the quarter sessions." Mr. Thomas: "If you do I shall spare no pains or expense to support the present conviction." Burke after some hesitation said he would not appeal, and begged to have the fine remitted. The magistrate would not listen to his application; and Burke having borrowed the money paid the fine and costs.

Isle of Man.—On Monday last a young man named Tyson gave himself into custody at Woolwich as one of the felons who escaped from Castle Rushen gaol in August last. The prisoner said he had been a serjeant in the 6th Regiment, but had with another soldier robbed his commanding officer and deserted. He had since enlisted in the Woolwich division of Marines. He escaped with five others on the 10th August, having been committed for trial on a charge of burglary in a farm-house. They effected their escape by means of some nails which they had got out of some boards, and picked the locks of the cells; then with some fishing nets they made a rope ladder, and escaped over the Castle walls at the Isle of Man. On arriving at the seaside, they found a gentleman's pleasure-boat. They all got in, and were one night and two days on the water without even bread and water. They landed on the Welch coast, scuttled the vessel and sunk her. It was a one-masted vessel with sails and pair of oars. They separated after landing, each taking a different road. He had since wandered about the country until he reached Woolwich, and being questioned by the police constable determined to give himself up. He had been, he said, concerned in several burglaries, and knew he should be transported, which was far preferable to the constant dread he was in. Mr. Jeremy said he should remand the prisoner for a week, in order to communicate with the authorities at the Isle of Man, when he would be again brought up and dealt with according to circumstances.

Knowsley.—The *Standard* of last evening states that her Majesty has been graciously pleased to remit the sentence of death on all the prisoners convicted of the murder of the Earl of Derby's gamekeeper, except John Roberts, the party who fired the fatal shot. Roberts is left for execution, and the others will it is expected be transported for life.

Lincoln.—The annual meeting of the Lincoln and Lindsey Agricultural Association was held on Friday, Mr. Chaplin of Blankney in the chair. The meeting was addressed by Mr. Christopher, M.P., Mr. Dudding, of Panton, and other gentlemen. Resolutions were adopted declaring the conviction of the meeting "that a repeal of the Corn-laws would be highly prejudicial to British agriculture and to the nation at large, that the efforts of the Anti Corn-law League to bring about this object ought to be vigorously resisted; that the doctrines taught by the emissaries of the League, tending to produce alienation and distrust between landlord and tenant, between the occupier and the labourer, are unchristian, anti-social, and dangerous to the peace of the country; and pledging the association to oppose such principles to the utmost of their power, by seeking for the co-operation of all societies established in this county for a similar object."

Leicester.—The authorities connected with the management of the borough gaol were much surprised last week by a communication made by a young man named Newman, confined on a charge of felony, to the effect that a conspiracy had been entered into among six men awaiting their trials, to make their escape, to carry out which two plans had been resolved upon. The first was to overpower the turnkey when he entered the ward, take the keys from him, and make a general outlet for all the prisoners; the other plan was to attack the schoolmaster and turnkey when attending prayers at chapel on Thursday, and in case they met with any resistance from the governor, they had sharpened a knife on both sides, so as to form a kind of dirk, which they intended to use for the purpose of stabbing. Through the information given by Newman both plans were defeated, and such precautions taken as to prevent any plan of a similar character being carried out. Newman who made the discovery had been tried on the previous Friday, when the Recorder sentenced him to four months' hard labour, but upon the magistrates stating the foregoing facts to him, he ordered the prisoner to be brought back, recalled the former sentence, and substituted that of one day's imprisonment. The two ringleaders with four others were severally sentenced to 10 and 15 years' transportation. Two of the gang were the most desperate characters in Leicester, and there is no doubt they would have carried their designs into effect had not the discovery been made.

Morpeth.—An affray with poachers took place last week at North Seaton in which two men who accompanied the gamekeeper of Mr. Watson were shot and severely wounded. The poachers had previously seized and beaten the gamekeeper, who returned to the village for reinforcements. His party amounted to 14 persons, the poachers were only four, but were each armed with a double-barrelled gun, a brace of pistols, and a sword, and their movements indicated them to be acting under a system of discipline. The keeper and his men were unable to disarm the poachers, and were consequently obliged to allow them to escape.

Nottingham.—The police have at length succeeded in discovering the hiding-place of one of the burglars who escaped from the county gaol on New Year's eve. On Friday last, in consequence of some intelligence they had received, the police went to Leeds, and spent the day in making inquiries respecting Binns. The next morning they went to his sister's house in Fountain-street, and discovered him in the pantry in the act of washing his hands. He was immediately seized and conveyed to the Leeds gaol. The prisoner was afterwards brought to Nottingham by the train and taken to gaol, whither he was attended by an immense concourse of spectators. Nothing satisfactory has been learnt respecting the others.

Newport Pagnell.—On Wednesday a meeting of farmers and others was held in this town for the purpose of opposing the projects of the Anti-Corn-law League. Mr. E. Greaves of Haversham presided. A resolution was passed declaring the participation of the meeting "in the almost universal feeling of abhorrence excited by the false and insidious statements and opinions put forth by the Anti-Corn-law League, which was a conspiracy to obtain free trade in Corn, but to preserve the protection enjoyed by the manufacturers." A resolution to form a committee and collect subscriptions was also carried, and it was estimated in the room that the subscription for the county of Bucks would amount to some thousands of pounds.

Oxford.—A meeting took place in this city last week for

the purpose of promoting the establishment of a general cemetery. Alderman Tawney was in the chair, and was supported by a considerable number of the clergy, municipal authorities, &c., including one of the representatives of the city, J. H. Langston, Esq. The Town-Clerk read several pages from Mr. Chadwick's report, pointing out the evils resulting from the crowded state of church-yards, confirmed by statistical tables, and suggesting a remedy. After some discussion on a proposition by the Rev. Mr. Hall that the cemetery should be exclusively for the church and not for all religious denominations, the Rev. Professor Buckland said that as to the general question that there was a necessity for cemeteries, that was admitted and felt all over the world, and in every instance it had been done on the broad principle. Example was at all times valuable to refer to, and if they looked to experience and what had already been done they would find, and he cited it as an historical fact, that in every case where cemeteries had been established they were for large communities, and he knew of no case where it had been necessary to have more than one, which was of a general and public nature. In carrying out such an object they must expect to meet with difficulties in detail, which they would surmount: but if each church was required to provide its burying ground, and 12 or 15 separate ones would be wanted, he would venture to say that it would not be done in 100 years. He had that morning received a letter from a friend of his, who told him that he had just got Mr. Chadwick's report on the interment in towns, which was full of curious and frightful facts. It was stated that in the parish of St. Margaret's, Leicester, there were 22,000 inhabitants, and from calculations and inquiries which had been made it appeared that some portion of that parish was effectually drained, some part but partially so, and the other not at all. In the latter the average duration of life was only 13½ years; while in the same parish, where it was partially drained, the average was 23¼ years, showing thereby the frightful effects of bad atmosphere. The city of Oxford was beset with pestilential ditches, which poured forth their poison; and if this was true, it was also in a certain degree with respect to that which was below the surface. He, for one, did not believe that anything but a general cemetery would correct the evil; for if seven parishes could find additional space, seven others could not, but must remain *in statu quo*, and the probability was the last seven would be the most populous and crowded, and required it the most. If, on the other hand, a general measure were adopted, and 14 acres found, it could easily be divided into 14 or 28 different portions. The expense also of getting several burying places would be ten-fold more than that of a general one; and there was another circumstance to be borne in mind, that there was the greatest difficulty to find even one appropriate spot, in consequence of nearly three-fourths of the vicinity of Oxford being utterly unfit for the purpose. All within a certain level was either immersed in water, or had clay within a foot of the surface, which rendered such spots objectionable. To come to the point, of all places which were the most fitted for the purpose, that ground was the best which had been geologically tested, and which would tend to accelerate decay. He had paid some little attention to bones, and he had in his possession the bones of a human being, which had not been buried more than seven years, and yet were in a more advanced state of decay than some which he had that had been buried thousands of years. The latter had been excluded from the effect of air and water, whereas the former, which had been sent to him by Lord Althorp, had been buried in a sandy rick-yard, and within 7 inches of the surface, so that it was within the reach of air and percolation of storms, and in that state had almost passed to dust. If ground is got for the mass of the people it is desirable that the coffins placed there should not last too long, for a cemetery was a resting-place, and intended for succeeding generations, and therefore the soil should be such as would accelerate decay. Lord Stowell had given his judgment in a way that could not be offensive to the feelings of any one, which was, that where iron coffins were used, an additional amount should be paid for the additional time a burying-place was occupied. In selecting a spot, it was absolutely necessary to select a gravelly soil, and consequently the greater portion of St. Clements was thereby excluded, and it was equally so with respect to the south and west of Oxford. The only ground that was in fact fit for a cemetery was in the north, where it was well known the gravel was deep; and the best site for it was between the Observatory and Summer-town, for on the east and towards Port Meadow the clay was very near the surface. He considered it impossible for ten parishes if they waited for ten years to find burying-places, whereas a general cemetery might be accomplished at once, and confer a great and lasting benefit on the community at large. The reverend professor was listened to throughout with the greatest attention, and sat down amidst plaudits from all sides. After an animated discussion the sense of the meeting was taken on the proposition, and on a division there appeared for Mr. Hall's motion for a church cemetery, 9; against and for a general cemetery about 50. On this decision the nine dissentients, all clergymen, retired from the meeting, which then proceeded to appoint a committee to carry their measures into effect.

Plymouth.—On Sunday evening shortly after eight o'clock a fire broke out on board the bark Cambridge, of Liverpool, undergoing repair on the patent slip at Teat's-hill. It originated in one of the cabins from the carelessness of a boy belonging to the ship. The crew succeeded in putting out the flames and all was supposed to be safe. Shortly after nine o'clock however it was discovered that the fire had been smouldering out of sight, and it broke out afresh. The fire increased, and it being thought desirable to remove the bark from her position, preparations were made for launching her, and as she was sent off the slip the vessel presented the most imposing spectacle. The fire had gradually crept up the masts, the flames were running up the shrouds, and were flickering on every inch of cordage in the rigging. Presently after, masts, yards and rigging were in one continuous blaze, which reached high above the trucks of the topmasts. As it was low water the engines were comparatively useless. Soon after the flames reached the forecastle the masts went by the board, when the fire becoming more condensed raged with redoubled fury. Any further exertion in favour of the ship was then useless. The flames continued up to 4 o'clock, A.M., on Monday, when the tide reaching her they were extinguished. She had no cargo on board.—Three persons have been convicted on the charge of being concerned in the burglary noticed in our last and sentenced to be transported for 15 years.

Portsmouth.—The authorities at the Horse Guards have ordered a General Court Martial to be held at this place, on Lieut.-Colonel Fuller commanding the 59th regiment in garrison here, relative to charges of small amount made against men discharged from the regiment, the proceeds of which were applied to the Regimental Fund, such charges being contrary to the army regulations. Lieut.-General Sir T. Arbuthnot is to be the president, and it is said the court will be composed entirely of officers in command of regiments.

Reading.—A meeting of the committee of the Berkshire Society for the protection of agriculture was held on Saturday at which Lord Barrington, M.P., Mr. Pusey, M.P., Mr. Duffield, M.P., and many other gentlemen attended, and it was resolved to get up a general petition to Parliament in favour of protection, to issue an address to the agriculturists inviting them to cooperate in opposing the League, and to have a public dinner early in February.

Rochester.—The adjourned inquiry into the case against the Rev. H. Winter, chaplain to the Fortitude convict-ship, and Mr. Bassett, butcher, of Chatham, was resumed on Friday, before a full bench of county magistrates. The inquiry excited great interest, and during the five hours' investigation the Court was so densely crowded that it was impossible to obtain standing room: every avenue leading to the Court was blocked up by farmers and others of the neighbourhood, anxious to hear the result. The evidence adduced on the previous day having been read over and some additional evidence brought forward, Mr. Espinasse was heard at length for the defendants. Ultimately the chairman decided that in default of any evidence on the part of the defendants, the bench must hold them to bail to answer the charge at the quarter sessions. Mr. Espinasse begged to offer some evidence, submitting that the bench ought not to hold the parties to bail, but leave the prosecutor to prefer an indictment at the sessions. He then called a man in the employ of Mr. Bassett, who stated, "I recollect the carcase of a heifer being brought to my master's on the 25th November in Mr. Winter's cart by Mr. Winter's man. Mr. Bassett went to the cart, and said he did not think he could do anything with it. The next morning by my master's directions I cut it up for the hogs. The bones I had for my perquisites and the skin went to the tanner's." This witness underwent a rigid examination by the magistrates, but persevered in his testimony. Mr. Espinasse offered to produce Mr. Bassett's pocket-book of the entry of the transaction. The magistrates ultimately determined to discharge the defendants, and leave the prosecutor to indict at the sessions or assizes.

St. Alban's.—On Sunday morning the Rev. James Brogden, residing at Childwick Hall, near Harpenden-common, believing as he alleges that some thieves were on his premises, posted himself at the upstairs landing window of his house with his double-barrelled gun, commanding a side view of the road. A police constable of the Herts constabulary was making his customary round of the premises, when he heard the report of two guns from the house; he immediately went up the Harpenden-road leading to the hall, a distance of sixteen yards from the outer gates, when he received the contents of a gun in his face, and upwards of thirty shots in the scalp of his head and other parts of his body. He staggered several yards, and fell bleeding to the ground from the wounds. Mr. Brogden who fired the gun immediately alarmed the inmates and every assistance was rendered, but from the serious nature of the wounds he was removed to the West Herts Infirmary, where he lies in a precarious state.

Windsor.—Captain Thomas Fernyhough, Governor of the Military Knights of Windsor, expired suddenly on Monday morning at his residence in the lower foundation of the Castle. He had for some time been afflicted with a disease of the heart, and on Monday morning while his medical attendant was in the act of administering some weak wine and water, he was seized with spasms of the heart, and in less than two minutes was a corpse. Capt. Fernyhough received the appointment in June last, on the death of the late Governor, Capt. Cumming.

Railways.—The following are the returns for the last week:—Birmingham and Derby, 1,468*l.*; Birmingham and Gloucester, 1,737*l.*; Eastern Counties, 2,412*l.*; Edinburgh and Glasgow, 1,927*l.*; Great Western, 10,932*l.*; Grand Junction, 5,844*l.*; Glasgow, Paisley, and Ayr, 1,274*l.*; Great North of England, 967*l.*; Hull and Selby, 958*l.*; London and Birmingham, 12,019*l.*; South Western, 5,144*l.*; Blackwall, 583*l.*; Greenwich, 732*l.*; Brighton, 3,073*l.*; Croydon, 209*l.*; Liverpool and Manchester, 4,158*l.*; Manchester and Leeds, 4,730*l.*; Midland Counties, 2,073*l.*; Manchester and Birmingham, 2,485*l.*; Northern and Eastern, 1,553*l.*; North Midland, 3,968*l.*; Newcastle and Carlisle, 1,307*l.*; South-Eastern and Dover, 2,449*l.*; Sheffield and Manchester, [illegible]; York and North Midland, 1,613*l.*—On New Year's Day the extension line of the Manchester and Leeds Railway from Collyhurst to the New Victoria station at Hunt's Bank was opened. There was no public celebration, the train taking its departure in the ordinary way, amidst the cheers of those assembled. This station is the largest in the kingdom, possessing a larger covered area than even the Derby station. Being the joint and central station connecting the uninterrupted Railway communication between the seaports of Liverpool and Hull, it will unite in a line of the most accessible communication four of the largest towns in the north of England—Liverpool, Manchester, Leeds, and Hull, and thus bring the German Ocean and the Irish Channel within a few hours' distance of each other, while it also links to this chain of communication the towns of Bolton, Oldham, Middleton, Rochdale, Huddersfield, Bradford, Halifax, Selby, and York; and gives access by means of its junction with the North Midland and York and North Midland Railways, to almost every other great line of railroad in the kingdom, north and south.—The supporters of the West Coast line, by way of Carlisle to Scotland, have at length succeeded in forming a company, and in raising the necessary funds for a single line of rails between Lancaster and Carlisle, a distance of about 70 miles. The whole extent of railway to be constructed to carry on the West Coast line from Lancaster to Scotland is about 170 miles through a country which will give full scope to the talent of the engineers. In the meantime the promoters of the East Coast line are not idle. Their railway will be opened as far as Newcastle next June, and as the North British Company propose to go to Parliament in the coming session for powers to construct a railway from Edinburgh to Berwick, only about 60 miles will be left unprovided for. Arrangements are already in progress for insuring the passing of an Act for the construction of the intermediate link in the session of 1845. There can be little doubt that whatever may be the progress of the West Coast line, the railway by the East Coast will connect England with the Scottish metropolis before three years.—The railway circular of Messrs. Railton of Manchester, just published, contains some curious information respecting the present value of railway stock. It appears that in the absence of failing harvests at home, and repugnance to foreign securities, the impatience of money for improvement has raised the value of railway stock in the last two months, since the end of October, 6,041,350*l.* on a paid-up capital of 45,855,896*l.* on eighty-two lines—the premiums being then 7,702,137*l.* over discounts, and now 13,743,187*l.*, or an increase of 30*l.* per cent. in the aggregate value of stock at the end of December last, when the premiums were 20,581,543*l.*, and the discounts 6,838,056*l.* It may be remarked, that towards the premiums 18,088,341*l.* was gained by the eight following lines, viz.:—London and Birmingham, 8,533,566*l.*; Grand Junction, 2,805,850*l.*; Great Western, 1,624,187*l.*; South Western, 1,578,115*l.*; Liverpool and Manchester, 1,567,457*l.*; York and North Midland (including Scarborough branch, 120,000*l.*), 816,800*l.*; Manchester and Leeds, 692,250*l.*; and Eastern Counties, 470,116*l.*—being 88 per cent. of the whole 20,581,543*l.*—At the special meeting of the Eastern Counties Railway shareholders held on Wednesday, the resolutions empowering the directors to carry out the extension lines to Cambridge, Brandon, and other localities and raise 960,000*l.* in the shape of a perpetual 5 per cent. stock for that purpose were carried unanimously. Although a protracted discussion took place on the various topics under deliberation it eventually resolved itself into an expression of the desire of the various parties to promote the success and prosperity of the general trunk lines. Mr. Cobbold's line to Ipswich it appears is not to be opposed by the company, and Mr. Braithwaite's line to Harwich is to be leased in connexion with the main trunk railway. It was also stated that a line from the station at Stratford to the River Thames is to be constructed and completed for 30,000*l.*, and then to be leased to its promoters for seven years at a *minimum* rent of 1,500*l.* per annum. The Harwich branch is to be constructed by an independent company, and the terms of the lease are to be 10,500*l.* for three years, and 8,400*l.* per annum afterwards in perpetuity, the net profits beyond the latter rent being equally divisible between the lessors and lessees.

IRELAND.

Dublin.—On Friday the clerk of the Crown attended in his office pursuant to appointment, for the purpose of proceeding with the reduction of the names selected on Thursday, from 48 to 24: each side, the Crown and traversers, having the right of peremptorily striking off 12. Mr. Kemmis was in attendance for the Crown, and Messrs. Cantwell and Mahony appeared for the traversers. The clerk of the Crown addressing Mr. Steele, who was present, said that as he had no attorney to act for him, he was desirous of giving him priority if he had any observation or suggestion to make. Mr. Steele said that he wished to leave the present business altogether in the hands of the professional gentlemen who attended on behalf of the other traversers. Mr. Mahony then protested against the jury panel, on the ground that 39 persons who were Roman Catholics and liberals were omitted from the list, although they had qualified before the Recorder. He exempted the High Sheriff, however, from any knowledge of the circumstance. The clerk of the Crown stated that he had no power of any kind over the panel. It had been arranged by the proper authorities and he could not abro-

system. He should, without further delay, go on with the business for which they had met. He then inquired who appeared for the traversers? Mr. Cantwell replied that he was subject to the protest he had handed in; and the striking off of the 24 names was then proceeded with. The counsel for the traversers again protested against the mode adopted on behalf of the Crown in striking off the names, declaring that their only object was to omit the name of every Roman Catholic on the list. Eleven out of the twelve appear to have been Catholics, and it is stated by the Crown party that they are all known repealers, and were therefore considered to be disqualified to act as jurors at the approaching trials. The list was finally reduced to the 24 who are to be summoned as special jurors in this case, and the first 12 of whom answering to their names, will constitute the jury to try Mr. O'Connell and his fellow traversers. The names stand in the following order —, J. Hamilton, wine-merchant; 2, J. C. Papworth, [illegible]reet; 3, Capt. E. Roper; 4, Stephen Parker, [illegible]; 5, Edward Clarke, Esq.; 6, Benjamin [illegible]; 7, James Hamilton, ironmonger; 8, [illegible], builder; 9, J. Croker, merchant; 10, [illegible], farmer, grocer; 11, Henry Thompson, [illegible], pianoforte maker; 12, Anson Floyd, china warehouse; 13, [illegible] merchant; 14, Robert Hanna, wine-merchant; 15, John Holmes, merchant; 16, William Longman, [illegible]; 17, William Ord, tanner; 18, Robert S. [illegible], Esq.; 19, Joshua M'Cormick, jun., wholesale [illegible], linendraper; 20, William Scott, cabinet-maker; 21, [illegible] merchant; 22, George William Morton Woodroofe, merchant; 23, James Waller, engraver; 24, [illegible], merchant. Mr. Mahony, at the conclusion of the reading of the above list, said that the matter might as well have been concluded on Thursday by the short and simple course of striking off every Catholic on the list. Mr. Cantwell, addressing the clerk of the Crown, said with considerable vehemence that he would not for 5,000*l.* sign such a panel or put his name to such a registry of bigots. Previously to all parties leaving the office Mr. Mahony repaired to the High Sheriff, who entered the room before the proceedings terminated, the complimentary observations which he had previously applied, and again stated that while he protested against the panel, he had to return Mr. Latouche thanks on behalf of his clients for the facilities afforded in his office. Mr. Latouche said that he had certainly endeavoured to give every facility in his power and to avoid granting one party any superiority over the other. In these times it was difficult for a person in his position to escape misrepresentation, and when he entered it he should always rest satisfied in his own mind, when convinced that the duties of his office were fairly administered. In reference to the striking off all the names of Roman Catholics on the jury list, a requisition signed by Mr. Sheil, Mr. Wyse, M.P., and other gentleman, has been got up, convening an aggregate meeting of the Catholics of Ireland for this day, the 13th inst., to petition Her Majesty on the subject: the Roman Catholic primate, Dr. Crolly, is expected to take the chair.—The weekly meeting of the Repeal Association was held on Monday and was very fully attended in consequence of the presence of Mr. O'Connell. Mr. Lynch of Ballycahier Castle presided. Mr. O'Connell moved that the following sentence from a letter of Col. Caulfield be inscribed on a banner to be hung up in the Conciliation Hall—"The time is come when no Irishman having the smallest claim to the regard or respect of his countrymen should longer hold back from expressing his sentiments." The man, he said, was a recreant of the worst description who did not come forward and declare for the nationality of Ireland at that moment. It was indeed a glorious prospect for the repeal cause, when the name of the illustrious Charlemont was found once more in the ranks of his country. Among the donations announced was 129*l.* 9*s.* 8*d.* from Rio de la Plata, the first contribution from South America. After some remarks on this subject, Mr. O'Connell proceeded to discuss the progress of Repeal. He said he was the apostle of the doctrine that one single drop of blood would defeat the best organised "Conspiracy," and he was happy to find that from the extreme north to the south of Ireland the people were determined to practise the most rigid peace. He wished that there should be no thronging or crowding the streets during the trials which were coming on, and what difference would it make if he were found guilty or not to the great cause in which they were all engaged? He certainly was not guilty of any offence but that of loving Ireland, and he therefore implored them by that love to stay at home and read the proceedings the next day in the newspapers. There would be was convinced be no riot, or tumult, or outbreak during the trials; and whatever the result was, it would not stop the mighty progress of the great cause in which they were all engaged. He looked back with the highest satisfaction to the proceedings of the last twelve months. In the beginning of that year their receipts were not more than about seventy pounds a week, and they amounted at that moment to upwards of four hundred, notwithstanding the badness of the times. At the beginning of the year their proceedings were scarcely taken any notice of by the English papers, but at that moment representatives from every paper in London were in attendance, who carefully recorded every word which dropped from them, and even the Government had their "recording angel" present. But for the rebellion they would never have had the union, and so it was at that moment—anything for a rebellion. They were going to call out the yeomanry, to stuff ragged fellows into two boots, and provided them with a sword to cut down the people. He then alluded to the thirty-seven monster meetings held during the last year, and said it was a miracle that, notwithstanding the millions who assembled in all parts of the country, not the least breach of the peace was committed, nor did the slightest injury occur to any individual. The Archbishop of Cashel, Dr. Slattery, had become a Repealer within the last six months. Mr. O'Neill had joined them; Mr. S. O'Brien had joined them, a gentleman of high and an ancient family—the lineal descendant of Brian Broombe, and one too who had made an experiment of thirteen years, and was at last forced to admit that no justice could be obtained from the British Parliament, and that no other hopes remained for Ireland but in a repeal of the Union. They had the Catholic hierarchy with them; they had the Catholic clergy with them; and where he would ask was the money which could bribe that body? He was happy to inform them that Mr. Nicholas Maher, of Thurles, would be returned in the room of the late Valentine Maher—a gentleman who was universally esteemed and respected for his amiable and excellent qualities; and it gave him great pleasure to find that the Association had taken up the subject of Lord Devon's commission, which was as great a humbug as ever existed. He then proceeded to refer to the coming prosecutions. He was forty years battling for Ireland—through good and through evil report—but he was never yet a martyr for her; he was ready now to become that martyr. The Government proposed to put down the agitation for Repeal by prosecutions, which were to commence on Monday next, and he had been asked to what day he would adjourn the association in consequence, as some of them must necessarily be absent on the 15th. That was the reason he would adjourn to that day, to show the Government that the people of Ireland could do without him and the rest of the traversers. No incarceration of him or any one else as long as there was peace and perseverance would suffice to put down Repeal. There was but one way of preventing Repeal, and that was by committing a breach of the peace. His only request, his only command to the people of Ireland was to be patient, peaceable, and constitutional, and they would have connexion with England continued by the golden link of the Crown, but a Parliament of their own. But without a repeal of the Union separation would be the inevitable result. Mr. O'Connell concluded by moving the adjournment of the Association to Monday next. The amount of the week's rent was 550*l.*—The Corporation of Dublin have had a long discussion on the suggestion of the ex-Lord Mayor to address the Queen for a committee of inquiry into the grievances of Ireland. An amendment had been moved by Alderman Butt, but the address to her Majesty was ultimately carried by a majority of 35 to 7. A meeting has also been held, at which a public expression of satisfaction at the conduct of the late Lord Mayor during his year of office was proposed. The meeting was attended by gentlemen of all political parties, but after some disturbance it was adjourned.

Clonmel.—In Mr. O'Connell's return to Dublin he passed through this city and was received with great enthusiasm. He was afterwards entertained at a banquet at which about 300 gentlemen were present. On his health being drunk Mr. O'Connell made a long speech, the burden of which was to recommend the people to abstain from any kind of violence, assuring them that they would thereby be certain of obtaining Repeal. He referred to the extraordinary progress which Repeal had made in the course of the last year, which he ascribed to the peaceful demeanour of the people. He said they had by their conduct demonstrated their fitness for self-government, and alluded to the effects of his coming trial by declaring that even if he be shut up in a prison the cause of Repeal cannot be retarded.

Achill.—A long account has appeared in some of the Irish papers of a conspiracy to murder the Rev. E. Nangle and others in the Protestant settlement established by that gentleman in the island of Achill on the coast of Mayo, about twenty miles distant from any town. The statement appears to have originated with a man called M'Hugh, but so little credence did the magistrate who received his informations attach to the story, that he took upon himself the responsibility of admitting the parties accused to bail until the ensuing assizes.

Tipperary.—The town of Nenagh on Saturday was thrown into great excitement by another outrage which took place in the immediate suburbs near the bridge of Tyrone, not one quarter of a mile from the centre of the town. It appears that as a man named Gleeson was returning from mass to his house at Lisatomy, he was met by two men at the above place, and on his passing them they turned quickly round and discharged two pistols at his back which took effect, the balls entering the back and passing out at the chest. On his falling they leaped upon him and kicked him and deliberately walked off. The man is not yet dead but there is no hope of his recovery.

SCOTLAND.

West Calder.—On Sunday last the dead body of an old man, named John Geddes, a labourer, residing in a cottage by himself on the farm of Longford, about three miles from West Calder, was found in a mangled state on the floor of his own dwelling. He had been missing for several days, but as he was in the frequent habit of working at a distance from home no alarm was excited among the neighbours till Saturday night, when there was no appearance of him as usual. On Sunday, therefore, it was resolved to break open the house to see whether he might not be ill, when they found his murdered body stretched on the floor. A relation of the old man called Bryce, a labourer, is suspected of being the murderer, and a reward of 50*l.* is offered for his apprehension.

Miscellaneous.

Earthquake.—On Friday the 22nd ult. a few minutes before 4 P.M. two violent shocks of an earthquake were felt in the islands of Guernsey and Jersey. A loud rumbling noise was heard, the windows rattled, and the doors of cupboards and wardrobes which were locked were forced open. The inhabitants were greatly alarmed, but no damage appears to have been done. The shock reached the French coast, and was very severe at Cherbourg about 4 P.M. The Devonshire papers mention that it was also distinctly felt at Exmouth between 3 and 4 o'clock.

Law.

ASSIZE INTELLIGENCE.—CHESTER.—*William Venables* was indicted for killing and slaying John Venables at Sandbach. It appeared that deceased was the father of the prisoner. At Sandbach races, on the 27th September, the prisoner quarrelled with a man named Sutton, and commenced fighting. The father put him out of the house; the prisoner however returning, supposing his father then about to interfere, said, "Old rogue, are you coming?" The father fell under the table, when the prisoner commenced kicking him in a most brutal manner; he then went to bed in great agony, and died next morning from a rupture of the bowels. Two surgeons were examined, who deposed to the probability of the rupture being produced by a fall; and the cause of the fall not being clearly ascertained. Mr. Temple put it to his Lordship as to whether there was any case to go before the Jury? His Lordship thought there was. Mr. Temple then addressed the Jury for the prisoner. The learned Judge having summed up, the Jury returned a verdict of Guilty, but recommended the prisoner to mercy. The learned Judge.—Upon what grounds? The Jury.—Upon the ground that it was by an accident. Mr. Justice Wightman (lifting up his eyes).—If, gentlemen, you have gathered a correct account of the evidence, you ought, if you did not consider it a wilful act, to have acquitted the prisoner; if otherwise, how can you return such a verdict? You had better return, and reconsider your verdict; then, if it is your opinion that the act was not wilful, it is your duty to return a verdict of acquittal, but if otherwise it is imperative on you to pronounce a verdict of guilty upon the charge in the indictment. The Jury hesitating, the learned Judge desired them to go to reconsider their verdict, which they did, and in a short time returned a verdict of Not Guilty.

Henry Hamlet, a calico dyer, was found guilty of feloniously causing a false entry of the death of his wife to be inserted in the register of the book of Dukenfield. The evidence went clearly to prove the tendency of the charge, and the prisoner was found guilty, and he was sentenced to five months' imprisonment with hard labour.

William Stockton was charged with poaching and offering violence to Joseph Stone, a gamekeeper. The evidence went to prove that the prisoner entered inclosed land with a pikel in his hand for the purpose of destroying game. Mr. Temple, counsel for the prisoner, objected to the framing of the indictment. By the Act of the 9th Geo. IV. it is recited that "if any person enters into inclosed land by night armed with a gun, net, or offensive instrument, he shall be considered to be guilty of a misdemeanour." He contended that by the terms of that indictment the prisoner was not attachable. He ought to be apprehended according to the terms of that Act, in the fact of taking game with a gun, net, or some instrument, and it was contended for the defence that a pikel was not of the nature of an instrument for destroying game. The Attorney-General contended that the mere act of entering into inclosed grounds with the intent to destroy game was sufficient to support the indictment. The learned Judge—This has no consonance with the terms of the Act. You must comply with the first section of the Act, before you can give validity to the framing of your indictment. The Attorney-General—I contend, with your Lordship's permission, that the indictment is fully sustained by the term "using any instrument." The learned Judge—An instrument! would not a musical instrument be an instrument? He thought that the indictment had failed in its construction, and the Jury returned a verdict of Not Guilty.

Samuel Maddocks was charged with the wilful murder of Matthias Bailey, gamekeeper to Mr. Wilbraham, at Cuddington. It appeared that the prisoner was a tailor, and lived with his brother, a farmer, in the vicinity of the place where the murder was committed. The deceased was gamekeeper to Mr. Wilbraham, of Delamere-hall, and had frequently suspected the prisoner of poaching. On the 28th July the deceased went out about 4 o'clock with his gun, and John, the brother of the prisoner, was seen soon after running without a gun, the deceased running after. It was the habit of the deceased to pull off his coat and throw down his gun on those occasions, to enable him to run faster. The prisoner had a gun, and when the deceased was running after his brother it was alleged that the prisoner came behind the deceased and discharged the gun, the charge of which penetrated the nape of the neck; he instantly fell and died. The principal witness in the case was Joseph Clarke, who upon examination before the magistrates had sworn to have been an eye-witness of the murder. Several witnesses were called to prove the state in which the body was found. For the defence it was alleged that the evidence was most vague and unsatisfactory; and with regard to the witness Clarke not to be relied upon for a moment. The learned Judge then went into an analysis of the whole of the evidence, commenting upon the discrepancies as they arose. He said the whole weight of the testimony rested with the witness Clarke, and it was for them to consider what credibility, if any, attached to his evidence. The Jury retired and were absent for about 20 minutes, during which a statement was made by Mr. Wilbraham, who was in court, which affected materially the truth of Clarke's statement. Mr. Temple for the prisoner hoped his Lordship would interrupt the deliberation of the Jury so as to give the prisoner the benefit of this piece of evidence. Joseph Clarke was recalled. By the Judge—Did you go to Mr. Wilbraham's in September last?—I don't know what part of the year September is in, and I never told Mr. Wilbraham that I knew nothing about the matter. Mr. Wilbraham examined.—Did the witness come to you in September about the story which his brother had told the night before?—I think he came voluntarily. I asked him if he knew anything about it, and he replied that he knew nothing about it. The Jury then again retired, and after an absence of an hour returned with a verdict of Not Guilty.

George Fox, a bailiff at Manchester, was indicted for the wilful murder of his wife. The Attorney-General and Mr. Trafford were for the prosecution. It appeared that deceased was a bonnet-maker residing in Stockport. On the 1st December the prisoner went out from home early in the morning and did not return until 10 o'clock at night, he was somewhat intoxicated. He beat his wife who ran away into the house of a neighbour. The prisoner followed and kicked her several times; and in her endeavours to release herself by going up the steps he caught hold of her gown and pulled her backwards, and falling on the stones she struck her head and never afterwards spoke. The prisoner afterwards would not go for a doctor and said she was not dead. The mother of the deceased proved the whole of these allegations which were mainly supported by the testimony of other witnesses. The Jury returned a verdict of Manslaughter, and the Judge sentenced him to two years' imprisonment with hard labour.

OXFORD CIRCUIT, STAFFORD.—*James Oakes* and *Benjamin Spilsbury* were charged with the wilful murder of James Beech, at the parish of Audley, in this county. The murder was committed on the morning of the 4th of last August, upon the land of R. E. Heathcote, Esq., at Apedale-

hall, near Newcastle, which has been much infested with poachers, whose continual nightly depredations have latterly been carried on to a considerable extent. In order to connect the prisoners with the transaction, a number of witnesses were called, the aggregate of whose testimony raised an amount of evidence against them, which seemed almost insurmountable. It was distinctly shewn that Oakes was in company with two other men on the previous evening, and was going in the direction of Mr. Heathcote's land. Several persons saw both him and Spilsbury about two hours after the murder, coming from the spot where it had been committed, and laden with hares. Their conduct also on many occasions after they were in custody tended to lead to the inference of their guilt. They were both notorious poachers; Oakes had been taken up by Beech for poaching in February last, and had repeatedly uttered threats of vengeance against the deceased; and some observations which they made while attending the inquest were proved militating strongly against the supposition of their innocence. For the defence it was contended that the conduct of the two men was hardly reconcileable with that of men guilty of murder, for it could scarcely be conceived that human beings, however depraved, could be so utterly lost to all sense of decency, and every regard for their own security, as to go on poaching for hours after the perpetration of a barbarous murder. The Judge and Jury seemed to coincide in this opinion, for both prisoners were Acquitted.

CARMARTHEN.—*The Rebecca Riots—Sentences of the Prisoners.—John Jones*, alias *Shony Scybor-fawr*, and *David Davies*, alias *Dai-y Cantwr*, were brought up for judgment, for destroying the Spudders Bridge Gate, &c. His Lordship addressing them said that the prisoner Jones had been convicted of shooting at a fellow-subject with the intention of doing him a grievous bodily harm, and had also pleaded Guilty to a charge of riotously and tumultuously demolishing a house. The Court had but too much reason to suppose that he was implicated in other offences of the same character as both of these. The prisoner Davies had pleaded Guilty to a charge of demolishing a house with others, and his Lordship knew from his own statement that he had been guilty of many similar outrages. As far as the Court was able to judge from the facts that had been laid before it, they were both strangers to this part of the country. What induced them to visit it his Lordship knew not, but it was rather curious that their appearance was noticed here not long after the commencement of those outrages by which this country had been disgraced. Whatever had been the motives that had actuated them they appeared to have been willing agents and had not been seduced into a breach of the law. The prisoner Jones might feel grateful that the shot he fired did not take a fatal effect, as if it had, instead of the Court passing on him a sentence of banishment from the country, it would have been obliged to pass the dreadful sentence of a violent death; but after the proof the prisoner had given of the disregard he entertained for the safety of his fellows and the rights of property in this country, it will be utterly impossible for him ever to return to it. The prisoner Davies would not be banished for so long a term, but still for a very long period of time; although probably the greater portion of his life would be spent in a foreign land. The sentence of the Court was that John Jones be transported beyond the seas for the term of his natural life, and that David Davies be transported for twenty years.—*Philip Phillip* and *William Phillip* were then brought up to receive sentence, for a riot and assault at Pound, in the parish of Llangannoc. His Lordship said that the prisoners were now to receive sentence for the very serious offence of which they had been found guilty—of a riot and assault on the person of a bailiff who came to distrain on the premises of William Phillip. It was a sad thing to see such an old man, the father and his son, brought up together to receive sentence for an offence of this description. It appeared to have been committed, not hastily or unadvisedly, but it seemed that the prisoners prepared to do it deliberately, and even threatened the bailiff on the day before. The sentence of the Court was, that William Phillip be imprisoned for 12 months and hard labour; and that Philip Phillip be imprisoned for 12 months.

David Evans and *James Evans* were then placed at the bar to receive sentence, on the charge of having, on the 30th of September last, with others, riotously and unlawfully assembled at Pantycerrig, in the parish of Llanfihangel, Rhosycorn. The counsel for the prisoners had thrown up their briefs, stating their conviction that perjury had been used. Both prisoners were found Guilty. The Judge said—That the prisoners were brought before the Court to receive sentence for a riot—a riot attended with circumstances of very great cruelty to a very old man, who had since in some manner or other lost his life. They armed and disguised themselves, and conducted themselves in such a way as to excite terror and alarm in the minds of all peaceable subjects, and proceeded to drag the old man out of his bed in the dead of the night, and James Evans personally ill-used him. The jury recommended him to mercy, and his Lordship strongly wished he could think it was on good grounds. One reason was that James Evans was a servant, and might have been influenced by his master. The defence he had set up proved his character anything but good. The exhibition of his poor little brother and sister in the witness-box was most revolting and shocking. The act of violence was bad enough, but the betrayal of his relatives into such a position was much worse. His Lordship was sadly afraid that people did not look with sufficient abhorrence on the crime of perjury. There was no crime more injurious to society, or more perversive of the proper administration of justice. Who could be safe if witnesses would come to a court of justice and call on God to bear witness to a falsehood? The Court did not punish him for this, however, but his Lordship mentioned it to show why he did not take the recommendation to mercy into consideration. The sentence of the Court was, that each of the prisoners be imprisoned and kept to hard labour for 12 calendar months.

Daniel Mainwaring, *Isaac Mainwaring*, *Thomas Mainwaring*, and *John Powell*, were indicted for destroying the house of Mary Rees, in the parish of Llandebie, and after a long trial Acquitted.

David Morgan, *James Morgan*, *George Thomas*, *John Lewis*, and *Evan Walters* were arraigned on a charge of burglariously entering the dwelling-house of Evan Davies, of Llanarthney, and feloniously stealing a sword. No evidence of the felony was offered on the part of the prosecution, and a verdict of Not guilty against all the prisoners was recorded. The same prisoners were then indicted for the misdemeanor of a riot. All of them except David Morgan pleaded guilty. No evidence was offered against him and he was discharged; the others were also discharged on being bound over to keep the peace and to appear to receive judgment whenever called upon.—*Thomas Davis*, a smith, charged with having broken into the house of William Thomas, of Maesbach, Llangendeirne, was Acquitted.—*David Jones*, a farmer, was charged with attempting to suborn and instigate one Daniel Lloyd to commit wilful and corrupt perjury. There was another count for attempting to suppress evidence. It appeared that Daniel Lloyd was about to give evidence on a charge of assault preferred against John Thomas; the prisoner, David Jones, gave Lloyd a sovereign to withhold his evidence against John Thomas. The prisoner was found Guilty of attempting to withhold evidence, and his Lordship in passing sentence said,—The jury had taken a very merciful view of his case. Had they found him guilty of attempting to persuade the witness to commit perjury he would certainly have been transported. It was of the utmost importance to the administration of justice that witnesses should be allowed to state fully and freely the whole truth on their oaths. It was of the utmost importance to the welfare of society that such should be the case. The prisoner had endeavoured to subvert the due performance of that duty, and should be made an example of. He was then sentenced to 12 months' imprisonment. *James Evans* was then placed in the dock to receive sentence for assaulting his wife in Newcastle Emlyn. He was sentenced to be imprisoned and kept to hard labour for 12 calendar months. *William Williams* was sentenced to 6 months imprisonment for a riot at Pentrebach turnpike-gate. *David Jones* was brought up to receive sentence for having sent a threatening letter to Mr. T. Williams of Llanegwad. His Lordship said that the jury had recommended him to mercy on account of his ignorance of the consequences of sending such a letter. On a consideration of the case, his Lordship could not think it was well founded. He had committed this sort of crime before, and had used threats in the presence of Mr. H. Lloyd Harris, a solicitor, who very kindly cautioned him. It would be well for him had he attended to his advice. The sentence of the Court was, that he be imprisoned for 9 calendar months. *Bridget Williams* was brought up to receive sentence for sending a threatening letter. His Lordship said, that the verdict and recommendation of the prisoner to mercy were very proper and just. She could neither read nor write, and he was disposed to believe that some wicked and ill-natured persons put it into her head to send it, she not knowing the consequences. She was then sentenced to 3 months' imprisonment. *Lewis Henry*, for the robbery at Gaterven, near Abergwilly, was sentenced to 10 years' transportation. His Lordship observed, that the prisoner had had the hardihood deliberately to tell the policeman that he would commit the robbery. He was unfit for the society of this country, and must therefore be removed. Several prosecutions for breaking down gates and for riots were abandoned.

POLICE.—MANSION HOUSE.—*The Wills Forgery Case.*—On Tuesday the day fixed for the adjourned examination of Mr. Barber, of the firm of Barber and Bircham, of Bridge-street, Blackfriars, and Mr. Joshua Fletcher of Walworth, on charges of defrauding Government by means of forged wills, the court was again crowded from an early hour by persons interested in the proceedings and others brought by curiosity to get a sight of the prisoners. Mr. J. C. Jordan was called, and deposed: I am the Registrar of Births and Deaths for the Belgrave district of Marylebone. On the 25th February last a person came to my house to register the death of a woman named Anne Slack, who had died at No. 8, South-terrace. I believe the prisoner Fletcher to be the person as far as I can recollect. I told him I did not know such a place in the district. He replied that it was a row of houses near the wooden bridge, but that no name was written up and that it was sometimes called South-place and sometimes Kemp-terrace. I then registered the name, "Anne Slack, female, 68 years of age; disease, gout." I asked whether it was gout in the stomach, and remarked that people rarely died of gout unless it attacked some vital part. He replied that she had been afflicted with it a long time, that it had then gone to the stomach and that he had been present at the death. I then asked him his own address, and he said it was 4, James-street, Commercial-road East. He then signed his name Robert Hart in my presence. Upon that I finished the entry and gave him the certificate. Upon the 14th of March following a woman in mourning came to me for a certified copy of the register, which I gave her. I have subsequently accompanied the Governor of the Giltspur-street Compter through the cells of the different prisoners. I went into six or eight cells, in some of which there were several prisoners. I at length went into the cell of the prisoner Fletcher and became convinced that he was the same man who made the entry.—Mr. E. A. Grattan next sworn: I am one of the clerks in the London and Westminster Bank. On the 22d March, 1842, the prisoner Fletcher opened an account at the Southwark branch of that bank. I have been in the habit of paying his checks. The signature of "Robert Hart" is his writing, somewhat disguised. I produce a bank note for 1000*l.* and two for 500*l.* each, on which there is written in the handwriting of the prisoner, "Emma Slack, 7, Francis-street, Tottenham-court-road." Other clerks of the Bank of England were called to prove the payment of the bank notes in the name of Emma Slack.—Mr. Clarkson said he was now prepared to go into another charge of the forgery of a will in the name of Eliza Burchard, Broad-st., Bristol, against the prisoners. Mr. Seaton of the Prerogative-office: I produce a paper, purporting to be the will of "Eliza Burchard, of Cooper-st., Westminster, afterwards of Rostock, Mecklenburgh, in Germany, then of New Bond-street, but late of Broad-street, Bristol, spinster." The handwriting and preparation closely resemble those of the other wills which I before produced. Mr. Cox proctor of Doctors'-commons: In 1840 I first became acquainted with the prisoner Barber. On June 9, 1841, he called at my offices accompanied by a female. He produced instructions for the probate of the will of Eliza Burchard; when prepared I sent the probate to Mr. Barber. I had had a small transaction with him a few days before. I received a check of 40*l.* from Mr. Barber for the amount of the probate duty in the case of Eliza Burchard. The amount was 2,000*l.* Mr. Noble: I am assistant accountant at the Bank of England. I recollect a person coming in 1841 in company with a female, with an authority to re-transfer into the name of a female, some Three-and-a-half per Cents. Reduced Stock, which had been transferred into the names of the Commissioners for the Reduction of the National Debt; and also for the receipt of 446*l.* 5*s.* dividends, which had become due thereon. It was on the 22d of June; the person who came was the prisoner Barber. I recollect his person perfectly well. Mr. Barber identified the female with him as Eliza Burchard, and Mr. Hill of the Stock Exchange identified Mr. Barber. It is usual for us to require some broker or member of the Stock Exchange to identify parties who are unknown to us. I afterwards delivered to Barber a direction to the chief cashier to pay the sum of 446*l.* 5*s.* The female was represented as the executrix. Mr. H. Hill: I am a stockbroker, and in 1838 became acquainted with Barber. On the 22d June, 1841, he called upon me and wished me to identify him at the Accountant's-office at the Bank. I went and found a female waiting for Barber. I was questioned, and in consequence of such questioning I subscribed my knowledge of him. Barber afterwards gave me instructions to sell 700*l.* Three and Half per Cents. Red. out of the name of Eliza Burchard, of New Bond-st., Bath. The woman signed the transfer, and upon that I gave Barber a check now produced for 686*l.* I crossed the check "and Co.," so that it must of necessity have passed through a banking-house. Mr. H. Fothergill: I am one of the clerks of the London Joint-stock Bank. On June 22, 1841, Barber who kept an account there paid in a check for 686*l.* On the 26th a check was honoured of the same amount. It was paid in four 50*l.* Bank notes, ten 10*l.* Bank notes, and the remainder in gold. The notes produced are those in which it was paid. Daniel Forrester the Officer, said that he had since the commencement of this inquiry made a journey to Bath; found that there was such a street as New Bond street, but could not find that any such person as Eliza Burchard had ever lived there. Had also been to Broad-street, Bristol, and could not learn that any such person as the testatrix or the executrix had ever lived there. Had searched the registers and could not discover any such names.—Mr. J. R. Tomkin had searched the register of deaths at Somerset-house from 1837 to 1841, and found the name of Eliza Burchard, of 27, Steven-street, Tottenham-court-road, registered as having died on the 21st March, 1841; but could not find that any such person had ever lived in that street. The death had been witnessed by a person who signed the name of Mary Brown, of 121, Tottenham-court-road; but it could not be ascertained that any such person had lived there. John Hewson, a letter-carrier of the General Post-office, proved that in June, 1841, he had a letter to deliver at 9, Great Russell-street, Bloomsbury, for Eliza Burchard; but having failed to discover any such person, the letter, after having gone through the hands of a second letter carrier, was returned to the dead-letter office in the usual course. This letter was from Mr. Barber to Miss Burchard, requesting her to call upon him to sign a document. Mr. Clarkson now addressed the Lord Mayor, and said that he was not at present prepared to go any further with this case, but should ask for another remand to some day before the next session of the Central Criminal Court, as inquiries were at present going on which he thought would enable him on a future occasion to show the ramifications of the system upon which the prisoners had been acting. After some remarks by counsel on both sides, with respect to calling Mr. Barber's clerk as a witness for the prosecution, as suggested by his counsel, it was resolved that the prisoner be remanded to the 22nd inst.—On Wednesday night at a late hour Daniel Forrester, the officer, arrived at the Mansion-house, having in his custody a respectably-dressed female whom he charged before the Lord Mayor as a person deeply implicated in the above transactions. The prisoner is the wife of a respectable tradesman in Oxford-street, to whom she has been married about twelve months. Her husband accompanied her to the Mansion-house, and is said to have suffered severely during the examination of two women who were produced by Daniel Forrester as witnesses to her identity. The Lord Mayor on hearing the statements of the witnesses committed the prisoner, who will be brought up with Barber and Fletcher, with whom she is represented as having been a principal performer in the forgeries at the Bank of England. Mr. Freshfield, solicitor to the Bank, attended the examination, and said that he had reason to believe that in consequence of the exertions and skill of Daniel Forrester an unbroken chain of evidence would be produced, connecting the prisoner not only with the cases of Miss Slack and Miss Burchard, but with other cases of fraudulent conspiracy under similar circumstances. It is said to have been evident from the conduct of the husband of the prisoner that he was wholly ignorant of the nature of the difficulty in which she is placed.

SPORTING.

TATTERSALL'S.—THURSDAY.—DERBY.—10 to 1 agst Colonel Peel's lot (take 12 to 1); 13 to 2 agst Mr. John Day's The Ugly Buck (take 7 to 1); 15 to 2 agst Mr. Crockford's Rattan (take 50*l.*, and aft. off,; 16 to 1 agst Mr. Quin's Loadstone (take 20 to 1 agst Lord Maidstone's Cockamaroo (t. to 25*l*; 30 to 1 agst Mr. A. Wood's Running Rein (take 33 to 1); 30 to 1 agst Mr. Lichtwald's Leander (do.); 40 to 1 agst Mr. Bowes's Saddle Bow (taken to 50*l.*); 40 to 1 agst Mr. J. Osborne's Mount Charles (take 50 to 1)

GAZETTE OF THE WEEK.

BANKRUPTCY ANNULLED.—W. GOATON, of Gutter-lane, Cheapside, City, fishmonger.

BANKRUPTS.—C. CLARKE, Banbury, Oxfordshire, linendraper—J. TURNER, Grange-place, Hoxton, cabinet-maker—A. SCOTT, 6, Cambridge-street, Golden square, auctioneer—A. BLAZDELL, 34, Upper Charlotte-street, Fitzroy-square, harp maker—C. B. ROE and T. J. BLACKFORD, Newport, Hampshire, bankers—G. SMITH, Northampton, carpenter—J. SHERWOOD, 59, Wood-street, Cheapside, City, stationer—H. ORRELL, Romford, Essex, victualler—G. C. BRIDGE, Malden, Essex, grocer—W DONNETT, Manchester, commission agent—E EVANS, Llangurdirne, Carmarthenshire, draper—W EASTHOPE, Shrewsbury, Shropshire, whitesmith—J. ROBOTHAM, Aldersgate-street, licensed victualler—W. ARMFIELD, Northampton, draper—H. SWANGATE and W. M ROBERTSON, Fleet-street, auctioneers—F. TOOTELL, Edgware, corn-dealer—J. SPROULE, Liverpool, chemist—J. ASHTON, Liverpool, chemist.

SCOTCH SEQUESTRATIONS.—J. HALKETT, Dundee, manufacturer—C. KERNAN, Edinburgh, linendraper.

BIRTHS.—At Torquay, Devon, on the 29th ult., the lady of Major-General H. T. ROBERTS, C.B., of a son, still-born—At Hampstead, on the 6th inst., the lady of Capt. Sir W. E PARRY, R.N., of twin daughters—On the 9th inst., at 6, St. George's Terrace, Hyde Park, Mrs. G. ARBUTHNOT, of a son—On the 8th ult., at Glasgow College, the lady of E. L. LUSHINGTON, Esq., of a son—On the 7th inst., at 21, Portman-square, the lady of Sir ALLAN E. BELLINGHAM, Bart., of a daughter.

MARRIED.—On the On the 3d inst., at Pavenham, Bedfordshire, the Rev. J. FOSTER, B.A., of St. Mary Hall, Oxford, to ROSALIND, daughter of the late H. Green, Esq., of Titley, Herefordshire—On the 8th inst., at Christ Church, the Rev. WM G NOTT, eldest son of Major-General Sir W. Nott, G.C.B., &c., to ADELA E. HELGAR, only daughter of Major-General FARARE.

DIED.—On the 7th inst., at the residence of G. Bankes, Esq., M.P., Kingsland, Dorsetshire, Sir C. E. NUGENT, G.C.H., Admiral of the Fleet, aged 86—On the 5th inst., Major-General F. J T. JOHNSTON, C.B.—On the 8th inst., at his residence, Lower Ward, Windsor Castle, in his 67th year, Captain T. FERNYHOUGH, Governor of the Military Knights of Windsor—On the 4th, at her residence, Bevis-hill, Southampton, aged 66, Mrs. HACK, well known as the writer of books for young people—On Thursday last, at Paris, MARIA STELLA, a lady who has for some years past excited much attention in the French capital from calling herself the daughter of the late Duc d'Orleans—On the 11th inst., in St. James's-place, Lady BURDETT, the wife of Sir Francis Burdett, Bart.

WANTED, to take the Management of a Nursery in the Isle of Man, a steady, industrious Man, of business habits, who has served a regular apprenticeship, and has a thorough knowledge not only of the Forest-Tree and Greenhouse department, but a taste for and been accustomed to Ornamental and Landscape Gardening—forming out and planting New Plantations, &c. As there is a Seed-business connected with the concern, a person with a knowledge of that department will be preferred, as his services may be in part required at the Shop.—None need apply unless he can produce good and sufficient testimonials of Character and Ability for the work. Apply to ALEXANDER SPITTALL, Whitehaven, Cumberland.

WANTED, as FOREMAN of the Houses and Propagator, a Young Man who thoroughly understands the various branches of In-door Culture, and who can produce ample testimonials thereof, as well as for unimpeachable moral conduct. Habits of order and neatness are indispensable. For further particulars, apply to F. C. BALL, Nurseryman, Taunton. Jan. 11, 1844.

A VACANCY for a MEDICAL APPRENTICE exists at a Public Institution, in one of our largest commercial cities. The advantages afforded are—residence in the family of one of the Medical Officers, with liberty to attend the regular course of study preparatory to examination, and ample opportunities for practice.—Apply at the Office of this Paper.

WANT PLACES.—All Letters to be post-paid.

TO NOBLEMEN AND GENTLEMEN.

AS HEAD GARDENER.—S. SNOW, Gardener to the Earl de Grey, having a single Young Man under him, aged 28, who has served him for 3 years and upwards, is desirous to obtain for him a Situation as above; having proved him fully competent to undertake a good situation. For particulars direct to S. SNOW, West Park, Silsoe, Beds., where testimonials as to character and abilities will be given.

AS GARDENER.—A single Man, aged 30, who thoroughly understands his Business, can have 2½ years undeniable character, and be strongly recommended, can take charge of Meadow Land if required, and has no objection to any part of the world.—Direct to J. B., No. 4, Westbourne-street, Pimlico, London.

AS GARDENER.—A married man; his Wife as Plain Cook; can also take charge of a small Dairy. Have no objection to make themselves generally useful. Can have an unexceptionable character from the Situation they are about to leave.—Direct to A. Z., Post-office, Hendon.

TO LANDED PROPRIETORS.—A young person of the highest respectability is desirous of obtaining a Situation as AGENT to a Nobleman or Landed Proprietor. He has been four years with a gentleman who has extensive estates under his management, and is, therefore, well qualified to undertake the duties of such a Situation.—Apply to J. C. M., at the *Agricultural Gazette* Office.

TO NOBLEMEN AND GENTLEMEN.

AS LAND-AGENT.—A thoroughly experienced Practical Agriculturist, who has long had the management of extensive property in one of the first Agricultural districts of Scotland, and who will shortly leave his present charge from unavoidable circumstances. For character and practical ability the most satisfactory references will be given.—Address to A.B., Mr. CUTHBERT'S Seed Warehouse, 12, Clayton-square, Liverpool.

THE GARDENERS' CHRONICLE AND AGRICULTURAL GAZETTE.

GARDENERS' BENEVOLENT INSTITUTION.

—At a special General Meeting of the Subscribers to this Institution, held on THURSDAY, Jan. 11, at the Crown and Anchor Tavern, for the special purpose of Electing Two poor persons on the Pension List of this Charity, the following was the result of the Ballot, viz.:—

JAMES ANDERSON	aged 72		174 votes.
ANN POTTER	62		140
ELIZABETH COLLYER	69		30
SAMUEL LYWOOD	65		22
JOHN BLAYLOCK	71		16

The Meeting then declared that JAMES ANDERSON and ANN POTTER, having the greatest number of votes, were duly elected Pensioners of this Charity. EDW. R. CUTLER, Sec.

TO THE SUBSCRIBERS OF THE GARDENERS' BENEVOLENT INSTITUTION.

ANN POTTER begs to return her grateful thanks to those Friends and Subscribers who so kindly exerted themselves on her behalf on Thursday, January 11th last, and by whose means she has been placed on the list of Pensioners.—Coomb-lane, Kingston, Surrey, January 18th, 1844.

GARDENERS' CHRONICLE for Sale.—The first 3 volumes clean and in good condition; volumes 1 and 2 in boards, 3 unbound. Price 3 guineas.—Apply to Mr. LEADHAM, Stationer, Kensall New Town.

THE LATE Mr. LOUDON.—A Public Meeting of the Friends of the late Mr. LOUDON will be held in the large room of the Horticultural Society's Establishment, Regent-street, London, early in February next, to consider the best means of extricating his Widow and Daughter from the difficulties into which they are placed by Mr. LOUDON's sudden death.

Due notice will be given of the day of meeting, when it is hoped that noblemen and gentlemen who patronise Horticulture, and also all Gardeners and Nurserymen who are within a reasonable distance, will attend.

AT a MEETING of the LINCOLN and LINDSEY AGRICULTURAL ASSOCIATION, held at the City Arms Hotel, Lincoln, on the 5th day of January, 1844, C. CHAPLIN, Esq., in the Chair, The following Resolutions were adopted:—

1. That while the tenantry of the country, and others investing their capital in Agriculture, have had their protection greatly reduced by recent Legislative enactments, it is the opinion of this Society that it would be the height of absurdity to countenance any scheme, however plausible, which in effect will tend to depreciate the productions of our soil, and thereby spread inevitable ruin throughout the rural districts of the country.

2 We, therefore, desire to reiterate our unalterable conviction that a repeal of the Corn Laws would be highly prejudicial to British Agriculture, and to the nation at large, and that the efforts of the Anti-Corn Law League to bring about this object ought to be vigorously resisted.

3 That the doctrines taught by the emissaries of the League, tend to produce alienation and distrust between landlord and tenant, between the occupier and the labourer, are un-Christian, and dangerous to the peace of the country; and we, the Members of this Association, pledge ourselves to oppose such to the utmost of our power, and to this good end we hope for the co-operation of all societies established in this county for a similar object.

4 That a Committee be now appointed to correspond with the other societies in this county formed for a similar purpose, and to adopt such measures as to them shall seem expedient.

5 Resolved—That a subscription in aid of the object of the Contingent Fund of this Society be now entered into, and that the Secretary be requested to write to the principal landed proprietors soliciting their subscriptions in aid of the same.

6 Resolved—That these resolutions be published.

Signed, CHARLES CHAPLIN, Chairman.

Resolved—That the best thanks of this meeting be given to the Chairman.

The following Subscriptions have already been received:—

Colonel Waldo Sibthorp, M.P.	£50	0	0
Charles Chaplain, Esq.	20	0	0
R. A. Christopher, Esq., M.P.	20	0	0

Wholesale Agents, DAVY, MACKMURDO, and Co., 100, Upper-Thames-st., London.

A SUCCESSFUL METHOD OF GROWING THE LISIANTHUS RUSSELLIANUS.

JAMES CUTHILL has printed the whole account of his treatment of the above most splendid plant, which has often been exhibited at Chiswick, Regent-street, and the Royal South London Societies; his largest plant this year having 600 blossoms on it, and gained the Large Silver Medal at the Royal South London Exhibition. A packet of seed, with the printed directions, will be sent at the small price of 2*s*. 6*d*. Also, very healthy plants of the above, from 2*s*. and upwards. Also, CUTHILL'S celebrated Early MELON; his Early improved Black Spine CUCUMBER, at 2*s*. 6*d*. each packet, or 6*s*. for the three packets.—Florist, Denmark-hill, Camberwell, London.

CUTHILL'S BLACK SPINE CUCUMBER PLANTS, very strong and healthy, to be had during January, February, and March.

TO DAHLIA-GROWERS, AND OTHERS.

THOS. ANSELLS intends sending out Two New and Splendid Seedling DAHLIAS, and which he can with the greatest confidence recommend.

The *Beauty of Camden*.—Colour bright red, occasionally shaded with bright pink, being the prettiest Dahlia-flower ever seen, and will be a great acquisition to any Collection; price of plants, 10*s*. 6*d*.

Ansells' *Clara*, light lilac, very compact, pretty full flower, but rather small; price of plants, 7*s*. 6*d*.

T. A. thinks it is useless saying more, after having sent out so many good Dahlias, and which, he has the pleasure to say, have given the greatest satisfaction.

Strong plants of the above to be sent out the first week in May, where a dozen or more is ordered they will be sent out the last week in April. T. A. has Ground Roots of (Bushell's) Emma, Emma Noakes, Pet Rival, and others, with all the approved sorts of last season.—Camden Nursery, Camden-town.

RANUNCULUSES, ANEMONES, CARNATIONS, AURICULAS and LILIUM LANCIFOLIUM.

H. GROOM, Clapham-rise, near London (removed from Walworth), by appointment FLORIST TO HER MAJESTY, begs to remind the Nobility, Gentry, and Amateurs, that this is the best season for obtaining Collections of the above Flowers, and that in consequence of the success he had in their cultivation last year, he can offer them at the following moderate prices:—

	£	s.	d.
100 Ranunculuses in 100 superb sorts with names	4	4	0
100 do. in 100 very fine sorts, do.	2	10	0
Superfine mixtures, from 7*s*. to 21*s*. per 100.			
100 Anemones in 100 superfine sorts, with names	2	10	0
100 Do. in 50 do. do. do.	2	0	0
Superfine mixtures, 10*s*. per 100.			
25 pair of Carnations, in 25 superfine sorts, with names	3	10	0
25 pair of Picotees, in 25 do. do. do.	2	10	0
25 Auriculas, in 25 superfine sorts, with names	3	13	6
Lilium lancifolium album, good bulbs, each	0	3	6
,, ,, ,, large bulbs, each	0	10	6
,, ,, punctatum, good bulbs, each	0	7	6
,, ,, ,, large bulbs, each	1	1	0

Catalogues may be had on application.—Jan., 1844.

GREAT FALL IN ONION-SEED.

J. G. WAITE, SEED MERCHANT, 1 and 4, Eyre-street Hill, Hatton Garden, London, begs leave to inform the Trade that he has just received a further supply of the finest ONION-SEED, in consequence of which addition to his former large stock, he is induced to offer the same at the following very reduced prices, viz.:—

	£	s.	
White Spanish Onion	16	16	per cwt.
Brown Port	14	0	,,
Deptford	14	14	,,
Brown Globe	15	0	,,
Blood Red	14	14	,,

And all other varieties at equally low prices.

J. G. W. has also a large collection of Agricultural, Horticultural, and Floricultural Seeds, of superior quality, grown from genuine stocks, which he can sell equally cheap.

NEW HARDY ANNUAL.

VISCARIA OCULATA—DARK-EYED VISCARIA.

T. AND J. BACKHOUSE, NURSERY AND SEEDSMEN, York, have the pleasure of offering to the Public the above new and beautiful Annual, which is figured at page 53, (No. 10), of the "Botanical Register," for 1843. The blossoms are of a bright rose colour, with a deep crimson eye, and changing to a pale purple. It flowers very abundantly through the greater part of the summer and autumn. It is a native of Algiers, and may be sown either in the open ground in spring, or raised in pots and planted out.

Packets, 2*s*. 6*d*. each, will be sent, on the receipt of a Post-office Order, postage free, to any part of the Kingdom.

FASTOLFF RASPBERRY.
YOUELL'S TOBOLSK RHUBARB.
TWO SEEDLING PICOTEES.
FINEST CARNATIONS AND PICOTEES.
ARAUCARIA IMBRICATA.

Now ready for sending out; for particulars of which see Advertisement of the 6th inst.

YOUELL & Co., Great Yarmouth Nursery, Jan. 18, 1844.

NEW DAHLIAS.
SPARY'S LADY ANTROBUS AND AURANTIA.

E. SPARY begs respectfully to call the attention of Nurserymen, Florists, and Amateurs to the above Seedlings, which received Prizes last season at the following first-rate Exhibitions, viz.:—Salt-hill, Salisbury Plain, Portsea, Chippenham, Stockwell, Surrey, &c. For description, Notices of the Press, &c., *vide Gardeners' Gazette*, 4th Nov.; *Gardeners' Chronicle*, 11th Nov.; also the November Number of the "Gardener and Practical Florist," page 332.

E. S. begs to inform the Trade that he has a few more Roots to spare: Lady Antrobus, 10*s*.; Plants early in May, 10*s*. 6*d*.; Aurantia, 6*s*., Plants, 7*s*. 6*d*.; with the usual discount per dozen. The select new and old varieties at moderate prices.

Hungerford, Jan. 16, 1844.

SHOW DAHLIAS.

W. R. WHALES' SEEDLING DAHLIAS for 1844, to be sent out in May, at 10*s*. 6*d*. each.

PRECEPTOR.—A splendid crimson scarlet, of good substance and outline, brilliant contour, and well cupped; an exquisite show variety; warranted to the description given of it; height 3 ft.; splendid habit.

SECOND CRIMSON PERFECTION.—A flower of great substance, being 20 petals deep; well cupped, rising centre, constant; first-rate habit; height, 4 ft. Early orders are necessary to procure this variety, being only true ground roots. Price 10*s*. 6*d*.

MARY.—A fancy border variety, white, margined with rose-pink; an abundant bloomer, and constant; occasionally a show flower; shape and habit of Girling's Prince of Wales; height, 3 ft. price 5*s*.—Elcot, near Huntingford, Berks. Jan. 17, 1844.

RANUNCULUSES.

MESSRS. TYSO AND SON, WALLINGFORD, BERKS, having cultivated this lovely tribe of Flowers with unparalleled success, are enabled to offer FINE STRONG ROOTS of splendid named sorts, such as were exhibited by them at the Surrey Zoological Gardens and Chiswick Gardens in June last, and to which Silver Medals were awarded. Named Assortments, 2*l*. to 10*l*. per 100; Mixtures, 5*s*. to 2*l*. per 100. For descriptive particulars and prices see their General Catalogue for 1844, which may be had post-free on application inclosing two postage labels.

GAINES' NEW AND FIRST-RATE PELARGONIUMS, now ready for delivery in strong, healthy Plants. The following are a few selected:—Gaines' Elegans nova, King of Beauties, Ackbar, Lady Prudhoe, Saxon King, Rector, Beauty Supreme, Mogul, Edith, Countess of Zetland, Cothestone, Egbert. A List of Pelargoniums, Pansies, Calceolarias, Fuchsias, Verbenas, Auriculas, Cinerarias, Chrysanthemums, Dahlias, &c., which contains many new Seedlings of first-rate qualities; also a few Roots of his Seedling Dahlias PRINCESS ALICE and TWICKENHAM RIVAL are still to be disposed of at the Nursery, Surrey-lane, Battersea.

TO GENTLEMEN PLANTING.

J. AND J. FAIRBAIRN are induced from the uncertainty upon which they hold the Manor-street Nursery (situated contiguous to the Home Nursery, Clapham Rise, where attention will be given to all applications), to effect a sale of the Stock at as early a period as possible, consequently beg to solicit the attention of Gentlemen and the trade to the large and remarkably healthy and well-grown stock, consisting of fine large Laurels, twice transplanted, of extra growth; Portugal Laurels, very handsome; Green Hollies, of various sizes; Evergreen Privets, fine Standard and Dwarf Roses in great variety, fine standard flowering Thorns, Almonds, Æsculus, Robinias, and other Ornamental Trees, and Evergreen and flowering Shrubs, with a large stock of fine standard and dwarf, trained and untrained Peaches, Nectarines, Apples, Pears, Plums, and Cherries, of the most approved kinds, and of growth rarely equalled; also, a large assortment of Forest Trees, consisting of Limes, Elms, Birch, Beech, Hornbeam, Spanish and Horse Chesnuts, Mountain Ash, Poplars, and Spruce, and Scotch Firs; also a large number of Gooseberries and Currants, of excellent growth, and of the best varieties in cultivation, to all of which J. & J. F. respectfully invite the inspection of Gentlemen and Nurserymen, flattering themselves that the general character of the Stock is such as to ensure unqualified satisfaction, and which they are disposed to offer at very moderate prices for cash.

J. & J. F. respectfully beg to call the attention of Gentlemen to their advertisement of Heaths, &c., which has lately appeared in the *Gardeners' Chronicle*. (Oct. 21 and 28.)

Nurseries, Clapham, near London. Jan. 5, 1844.

SPLENDID NEW SEEDLING CINERARIAS.—Fine early-flowering strong plants of CINERARIAS, saved from the very choicest sorts of blue and crimson colours, selected from between five and six thousand Seedlings of last year. Those purchasing will have an opportunity of flowering some of the choicest sorts in cultivation, remarkably healthy, and having a large stock they can be sold at 9s. and 12s. per dozen, carefully packed for any part of the country. Applications including Post-office orders will be immediately executed. Large bunches of RUSSIAN VIOLETS in full flower, fit for potting, 6s. and 9s. per doz.—Direct to MICHAEL BARNES, Sen., Cambridge Nursery.

T. & C. LOCKHART & DUNCAN, SEEDSMEN AND FLORISTS, 156, Cheapside, London, have just published their List of Seeds and Ornamental Greenhouse and Hardy Plants, which they will forward, free by Post, on application. They have purchased some very superior Pink Seed of one of the first growers, which they are selling in packets at 2s. 6d. and 5s. each. As it rarely occurs that it is offered of such quality, and as the Stock is very limited, they respectfully request early orders. If sown in March, Pink Seed flowers the same season. Early Walcheren Broccoli Seed, 4s. per ounce, sent free by Post.

JOSEPH HAMILTON'S unparalleled successful system of cultivating the PINE-APPLE and CUCUMBER, together with Hints on the VINE, has been long delayed by the printer. Will be ready on the 25th inst., positively. Price 6s. London: Published by Mr. JOSEPH MASTERS, 33, Aldersgate-street, and may be had of all other Booksellers; also of Mr. THOMAS WILD, 3, Tavern-street, Ipswich, or of the AUTHOR, Thornfield, near Stockport, Lancashire.

MARNOCK AND MANLEY'S CATALOGUE of NEW AND CHOICE FLOWER-SEEDS, with full and particular Directions for the best Modes of Cultivation, with the Treatise on the Walcheren Cauliflower is now ready, and may be had on application.

Their Stock of trained Fruit-trees are exceedingly fine, consisting of all the leading varieties of Peaches, Nectarines, Apricots, Plums, &c. Also the following Cherries:—Harrison's Heart, Black Heart, Adam's Crown, Waterloo, Knight's Early Black, Florence, Black Eagle, Downton, Late Duke, May Duke, Bigarreau, Elton Napoleon, Early Purple, Circassian, Kentish, Morello of sorts, &c. Prices may be had on application at their Nursery, Hackney, London.—Jan. 17, 1844.

EARLY PEAS, &c.—HENRY D. CORMACK, SEEDSMAN, &c., begs to inform the readers of the *Gardeners' Chronicle* that they can be supplied with the following Early and Prolific Varieties, viz.: Cormack's Prince Albert, British Queen, and Early Kent Peas, Taylor's Improved Windsor, and Johnson's Wonderful Bean; Manchester Red and Seymour's White Celery, Walker's Long and Hamilton's Cucumber, &c., with every other variety of Horticultural and Agricultural Seeds, at his Wholesale and Retail Seed-Warehouse, 106, Deansgate, Manchester.

THE BRITISH QUEEN AND PRINCE ALBERT PEAS.

WM. JNO. CORMACK begs to call the attention of Noblemen, Gentlemen, and others, to the above two new Varieties, the merits of which are thus noticed in the *Gardeners' Chronicle*. "THE BRITISH QUEEN on light soils, is the best of all kinds, and will drive Knight's Tall Marrow out of the garden." "THE PRINCE ALBERT, which has been cultivated in the Garden of the Horticultural Society during the season, produced Peas fit for the table *ten days earlier* than any other variety sown at the same time." Both varieties may be had in packages at 3s. 6d. each, at W. J. C.'s wholesale Establishment, Newcross, or the Bedford Conservatory, Covent Garden.

SHILLING'S EARLY GROTTO PEA.

J. AND S. SHILLING have succeeded in raising the above PEA, the Early Frame Pea, impregnated with the Grotto or Oyster Marrow, which they, with confidence, recommend to the Public generally, being quite as early, and nearly double the size of any other Pea in cultivation. Quite hardy, will stand the winter well, and a good bearer; the pod large and long. They would particularly recommend it to the attention of Market Gardeners. Price 3s. per quart; 10s. per gallon; 17s. 6d. per peck; 30s. per half-bushel; 2l. 10s. per bushel. Agents:—Messrs. FIELD and CHILD, 119, Lower Thames-street, London; Messrs. W. and J. NOBLE, 152, Fleet street; Mr. KERNAN, 4, Great Russell-street, Covent Garden; Messrs. HURST and McMULLEN, 61, Leadenhall-street; Messrs. GRAY, ADAMS, and HOGG, Kensington.—Northwarnborough Nursery, near Odiham, Hants, Jan. 5, 1844.

HOOSAINEE MELON SEED.

R. WHITE & Co. beg to inform their Friends and the Public, that their new Culinary and Flower-seeds are now ready for delivery, and include a few remaining packets of the above splendid variety of Melon, from the fruit exhibited by Mr. Fleming, at 5s. per packet. Also, true Walcheren Cauliflower Broccoli, at 3s. per oz. A new and very fine Vegetable Marrow, noticed by DR. LINDLEY as being superior to all others; together with every other truly desirable kind. Kitchen-garden Seeds in collections of all the best kinds, in sufficient quantity for a first-rate establishment, sent free to all parts, 3l. 3s. The same in smaller quantity, 2l. 2s. Complete collection suitable for smaller families, 1l. 1s. A fine Collection of Flower Seeds, comprising 60 distinct and choice kinds, 1l. 1s. Orders from unknown correspondents must contain remittance.

Poole Nursery, Jan. 13, 1844.

TO FLORISTS, NURSERYMEN, &c.

AUSTIN & SEELEY have now a Quantity of GARDEN ORNAMENTS, which have been discoloured by exposure to the London atmosphere, and which they are therefore desirous of selling at a considerable reduction.—New Road, Regent's Park.

DOUBLE ITALIAN TUBEROSE ROOTS.

THE ANNUAL IMPORTATION of these fine FLOWER-ROOTS has just been received by FREDERICK VALES, at his old Italian Warehouse, 21, Haymarket.

TO SEEDSMEN AND OTHERS.

FOR ABSOLUTE SALE (in order to clear the stock), in one or more Lots, a Quantity of SEEDS, consisting of Cabbage, Cauliflower, Broccoli, Radish, Beans, Celery, Cucumber, Beet, Endive, Furze, at the lowest Prices, for cash.

For particulars apply to Messrs. PROTHEROE & MORRIS, American Nursery, Leytonstone. N. B.—A Discount of 5 per cent. will be allowed to all purchasers above 10l.

HORTICULTURAL IMPROVEMENT.

READ'S PATENT GARDEN SYRINGE, for the invention of which he has been honoured with the Silver Medal of the Royal Horticultural Society, as the best instrument ever offered to their notice. J. R. has so IMPROVED the above, by an additional branch, to turn in every direction, so that water may be dispensed into all pots in Conservatories, in a perpendicular direction, resembling a gentle shower or dewfall, and in any quantity, from a pint to a table-spoonful. Likewise, small Machines, Pails, Trucks, and Garden Engines of every description, that will discharge water in a continuous, powerful stream, made on the most improved principle, and may be worked with half the usual labour required for other Engines now in use. The above are the best adapted for destroying insects, which make such deadly havoc on all choice Fruit-trees and Plants in Gardens, &c. which the Patentee, from 31 years' experience in Gardening, and 23 years in Manufacturing and Improving Instruments, can safely warrant. The valves, being solid metal, can never get out of repair. May be seen and proved at the Patentee's, 35, Regent Circus, Piccadilly. N.B.—None are genuine except stamped with the words, "READ'S PATENT."

HORTICULTURAL SOCIETY OF LONDON.—LIST OF PRIZES

OFFERED AT THE EXHIBITIONS IN THE GARDENS, IN 1844.

MEDALS AND REWARDS.

The Society distributes the following Medals and Rewards; viz.:

	value—£	s.	d.
C. The Certificate	0	10	0
SB. Silver Banksian Medal	1	0	0
SK. Silver Knightian Do.	1	5	0
LS. Large Silver Do.	1	15	0
SG. Large Silver Gilt Do.	4	0	0
GB. Gold Banksian Do.	7	0	0
GK. Gold Knightian Do.	10	0	0
LG. Large Gold Do.	20	0	0

Exhibitors to whom any of these shall be awarded can exchange them one for another, or may receive their value in money, or in plate. In case an Exhibitor shall receive a First Prize in any one Letter, he shall not be entitled to receive any other Medal in the same Letter, except in *CC*, *DD*, and *EE*.

CLASS I.—FLOWERS; for which Nurserymen and Private Growers exhibit independently of each other.

A. Pelargoniums, in collections of 12 new and first-rate varieties, cultivated with superior skill, in pots of 24 to a cast. GB—SG—LS—SK.

B. Pelargoniums, in collections of 12 varieties, in pots of 12 to a cast. SG—LS—SK.

N.B. Persons exhibiting in *B* cannot also exhibit in *C*.

C. Pelargoniums, in collections of 6 varieties, in pots of 8 to a cast. LS—SB.

D. Rhododendrons, in pots; not fewer than 6 plants, in 6 varieties. LS—SK—SB.

E. Roses, in pots; Amateurs to show in collections of 12, Nurserymen in collections of 25, distinct varieties. GB—SG—LS.

N.B. It is the wish of the Society in a future season, to require Roses to be shown exclusively in pots; and not to allow cut specimens to be exhibited at all.

F. Moss Roses in loose bunches, so as to exhibit, as far as possible, the habit of the variety; in 12 varieties. SK—SB—C.

G. Other Roses, exhibited as in the last letter, and in 50 varieties. LS—SK—SB—C.

N.B. No one who exhibits in this letter can also compete for the following.

H. Other Roses, exhibited as in the letter *F*, and in 25 varieties. SK—SB—C.

N.B. Higher medals than those here offered for Roses cannot be given by the Judges. And if Roses are brought for exhibition without attention to the regulations here explained, they will not be allowed to be placed on the tables.

I. Cape Heaths, in collections of 20 distinct varieties. GB—SG—LS.

N.B. It is expected that the same plant shall not be exhibited on more than one occasion.

K. Cape Heaths, in collections of 6 distinct varieties. SG—LS—SK.

N.B. No person who shows in *I* will be allowed to exhibit also in *K*.

L. Calceolarias, in sixes; in pots of 12 to the cast. LS—SK—SB.

M. Carnations, in pans of 24 distinct varieties. LS—SK—SB.

N. Picotees, in pans of 24 distinct varieties. LS—SK—SB.

O. Pinks, in pans of 24 distinct varieties. SK—SB.

CLASS II.—FLOWERS; for which all persons are admitted to equal competition.

P. Stove or Greenhouse Plants, in collections of 30 plants. GK—GB—SG—LS.

N.B. Heaths, Calceolarias, Fuchsias, Greenhouse Azaleas, Rhododendrons, Orchidaceæ, Cacti, and Pelargoniums, to be excluded from *P*, *Q*, and *R*.

Q. Stove or Greenhouse plants, in collections of 15 plants. GB—SG—LS.

N.B. Persons exhibiting in *P* not to compete in *Q* also.

R. Stove or Greenhouse plants, in collections of 6 distinct species. SG—LS—SK.

N.B. Persons exhibiting in *P* or *Q* will not be allowed to compete in *R* also.

S. Greenhouse Azaleas, in 12 distinct varieties. GB—SG—LS.

T. Greenhouse Azaleas, in 6 distinct varieties. SG—LS.

N.B. No one can show in both classes of Azaleas.

U. Stove or Greenhouse climbers, in collections of 6 species. SG—SK.

V. Exotic Orchidaceæ, in collections of not fewer than 20 species. LG—GK—GB.

N.B. Exhibitors cannot show in more than one of the classes *V*, *W*, and *X*.

W. Exotic Orchidaceæ, in collections of not fewer than 6 species. GK—GB—SG.

X. Exotic Orchidaceæ in single specimens. SG—LS—SK.

Y. Plants in glass cases, grown on Mr. Ward's plan. SG—LS—SK.

N.B. It is highly desirable that these cases be made with a movable door, so as to prevent the condensation of the water on the inner face of the glass during the time of exhibition.

Z. Distinct varieties of Tall Cacti in flower. GB—SG—LS.

N.B. The GB and SG Medals are not to be given if fewer than six varieties are exhibited.

AA. Fuchsias in collections of 12 distinct varieties. LS—SK.

BB. Cinerarias, in pots, in collections of 12 distinct varieties. SK—SB.

CC. Single specimens of new or extremely rare ornamental plants. SG—LS—SK—SB—C.

N.B. These Medals will be awarded by the Society's Officers, and not by the usual Judges. Exhibitors will particularly observe that none but new or rare plants can be exhibited under this letter. *Nothing will be regarded as new which has been exhibited in the Gardens in a previous season.*

DD. Miscellaneous subjects SK—SB—C.

N.B. Cockscombs, Heartsease, Hydrangeas, and cut flowers, are altogether excluded from exhibition. Exhibitors under this head will not be thereby *entitled* to a pass ticket.

EE. Seedling Florists' flowers. SK—SB—C.

N.B. Every seedling must be shown singly, and must be marked with the name it is to bear. The same seedling cannot gain a prize more than once in the season. Pelargoniums are to be shown in pots, and not in a cut state. No person will be allowed to exhibit more than five seedlings at each meeting. Exhibitors under this head will not be thereby *entitled* to a pass ticket.

IN ADDITION to any medals assigned to the classes *I*, *P*, *Q*, and *W*, the SK and SB medals are offered for the two collections in those classes which shall be best named by the Exhibitor.

N.B. The Society's officers, who will make this award, will be guided in their judgment by a consideration not only of the correctness of the names, but of the accuracy of the spelling, and the neatness of the writing.

CLASS III.—FRUIT, for which Market Gardeners, Fruiterers, or persons in the habit of regularly supplying the market, and private growers, exhibit independently of each other.

N.B. All Fruit must be FULLY ripe and WELL-COLOURED; if the contrary it will be disqualified.

FF. Miscellaneous collections of Fruit, consisting of at least three different kinds, Peaches and Nectarines being considered as only one kind. GK—GB—LS.

N.B. Cucumbers, Tomatoes, Gourds, and similar Kitchen Garden produce, are excluded from this letter.

GG. Grapes. SG—LS—SK—SB.

HH. Pine-apples. SG—LS—SK—SB.

II. Peaches or Nectarines, in dishes of six specimens. SK—SB.

KK. Other kinds of Fruit. SK—SB—C.

JUDGES.—The Judges have the power of *increasing* or *diminishing* the number and value of the silver medals offered by the Society for particular objects, and also of *conferring* Silver Medals or Certificates in cases not contemplated in these regulations, if they think it necessary to do so.

The Judges are also required to bear in mind that the Society's Medals are offered less for new and curious objects, than for fine specimens of Horticultural skill, the design of the Council in instituting these meetings being not so much to encourage the collector as to reward the skilful Gardener; they are also not to make any award in cases where the objects exhibited do not appear worthy of a Medal; otherwise a bad single exhibition might obtain a prize, merely because there is no better exhibition of the same class to oppose it.

Copies of the above list may be obtained at 21, Regent-street, upon application to the Secretary.

NEW WORKS FOR THE USE OF FARMERS.

This Day is Published, Imperial 4to., half-bound, 10s.

BRITISH FARMER'S ANNUAL ACCOUNT-BOOK, upon a New and Improved System. By the Author of "British Husbandry."

Also, by the Same Author, in a Small Volume, Fcap. 8vo., 6s. 6d.

MUCK MANUAL; for the USE of FARMERS; being a PRACTICAL TREATISE on the NATURE and VALUE of ANIMAL and VEGETABLE MANURES.

"A little volume which, for its valuable information, will be read with avidity."—*Farmer's Herald.*

"Addressed to the practical farmer, and written as such books ought to be."—*Bell's Weekly Messenger.*

"Of great value, and ought to be the pocket companion of every farmer."—*Derbyshire Courier.*

JOHN MURRAY, Albemarle Street,
Publisher to the Royal Agricultural Society of England.

On January the 8th, 1844, will be published, handsomely printed in Demy 8vo., Part the First, Price 12s.,

SPECIES FILICUM; OR A SYNOPSIS OF ALL KNOWN FERNS. This first part contains GLEICHENIACEÆ, POLYPODIACEÆ in part, and PLATES i. to XX. By Sir WILLIAM JACKSON HOOKER, K.H., LL.D., F.R.S., &c., &c., Vice President of the Linnean Society, and Director of the Royal Botanic Garden at Kew.

*** It is intended to publish Part the Second on the 1st March, 1844.

London: WILLIAM PAMPLIN, 45, Frith-street, Soho-square.

HOOD'S MAGAZINE.—The JANUARY Number was published on the MORNING of Saturday, 30th Dec., in time for the Booksellers' monthly parcels to all parts of the Kingdom. Subscribers are requested to give EARLY Orders for the Second Number to their respective Booksellers. All complaints of delay or difficulty in the execution of orders are requested to be addressed to the Office, 1, Adam-st., Adelphi.

In Weekly Numbers, price Three-halfpence, and Monthly Parts price Sevenpence,

CHAMBERS' EDINBURGH JOURNAL; a New Series, in an improved form, offering an opportunity for commencing the Work, without the necessity of purchasing the previous volumes.

A Stamped Edition, price Twopence-halfpenny, or sent weekly on payment of a quarter in advance.

W. S. ORR and Co., London. Orders received by all booksellers and newsvenders.

SCHOOL BOOKS BY WILLIAM BUTLER.
EDITED BY THOMAS BOURN.

CHRONOLOGICAL, BIOGRAPHICAL, HISTORICAL, and MISCELLANEOUS EXERCISES. 11th Edition. 12mo. 7s. 6d. bound.

2. ARITHMETICAL QUESTIONS. 13th Edition. with Additions by GEORGE FROST. 12mo., 6s bound.

3. EXERCISES on the GLOBES and MAPS, interspersed with Historical, Biographical, Chronological, Mythological, and Miscellaneous Information. To which are added QUESTIONS FOR EXAMINATION. With an Appendix, by which the Constellations may be easily known. 14th Edition. 12mo., 6s. bound.

4. A KEY to the EXERCISES on the GLOBES 2s. 6d. sewed.

5. MISCELLANEOUS QUESTIONS in ENGLISH HISTORY and BIOGRAPHY. 5th Edition. 12mo. 4s. bound.

6. GEOGRAPHICAL EXERCISES on the NEW TESTAMENT; describing the Principal Places in Judæa, and those visited by St. Paul; and narrating the most important occurrences recorded in the Evangelical Histories. With Maps and a Brief Account of the Principal Religious Sects. 5th Edition. 12mo., 5s. 6d. bound.

7. ARITHMETICAL TABLES, &c. 20th Edition. with Additions. 8d.

Sold by DARTON & HARVEY; and SIMPKIN, MARSHALL, & Co.

Just published, in one vol. royal octavo, price 2 Guineas,

THE VALUE OF LANDED PROPERTY, demonstrated by Practical Deductions and Illustrations, tending especially to facilitate the Valuation of Estates, as applicable to the purposes of Agriculture. By LAYTON COOKE, Land-Agent and Surveyor. Published by the AUTHOR, at No. 7, John-street, Adelphi, London.

HORTICULTURAL SOCIETY OF LONDON.—Notice is hereby given that the Exhibitions of Flowers and Fruit, in the Society's Garden, in the ensuing season, will take place on the following Saturdays, viz., May 18, June 15, and July 13. In addition to the regulations already announced, it has been resolved that the Judges be instructed, in making their awards, to take into consideration, whether the Plants to be judged have been exhibited previously during the season. Full information concerning these Exhibitions can be obtained upon application at 21, Regent-st.

The Gardeners' Chronicle.

SATURDAY, JANUARY 20, 1844.

MEETINGS FOR THE TWO FOLLOWING WEEKS.

Wednesday, Jan. 24.	Entomological Society of Arts	. .	8 P.M. 8 P.M.
" "			
Friday, Feb. 2 .	Botanical	. .	8 P.M.

The vegetable kingdom, as well as the animal kingdom, is subject to Disease. We need not here define very accurately what disease is. When it occurs in ourselves, we are quite aware that the functions of our frame are not carried on in the usual way. It is the same with plants. When any of the functions by which their structure and reproduction are maintained become deranged, disease is said to be present. Although the diseases of men and animals have been investigated with great care, and animal pathology and morbid anatomy have assumed an importance equal to animal physiology and anatomy, yet the same attention has not been given to the pathology of plants. This cannot arise from the want of facts to investigate, or the small importance of the subject, as every one with a garden is perfectly aware of the frequent occurrence of diseases amongst plants, and their destructive consequences. Of some of these diseases and their depredations we have many scattered notices; but, as yet, no work has appeared on the diseases of plants in the English language. This subject has not, however, been so much neglected on the Continent, especially in Germany, where Wiegmann, Bischoff, Meyen, and others, have produced treatises, more or less perfect, on the pathology of plants. We purpose from time to time to draw attention to this subject in the *Gardeners' Chronicle*, and shall endeavour to furnish our readers, in a form as systematic as we can adopt consistently with the most important facts that have been observed on the diseases of plants, and endeavour to lay down some principles for their cure and prevention. In this work, we hope not only to have the approbation, but the assistance of our readers. Just as in the study of medicine, every well-recorded case is of importance toward establishing the principles of human pathology, so every accurately-observed case of disease in plants will assist us in the work we have before us. As we proceed, we shall endeavour to point out the most important circumstances that should be attended to in the observation and relation of particular instances of disease. Wherever it is practicable, we should always prefer that all accounts of diseases of plants should be accompanied by specimens, which may be sent to our office, Charles-st., Covent Garden.

Before proceeding to any details on particular diseases of plants, we shall make a few remarks on their classification, causes, and treatment; and 1st, of their classification. We may arrange the diseases of plants in several groups, according to their situation and causes. When arranged according to their situation, those are called *general* which attack the whole plant, and those *local* which invade only a part. Such a division is, however, difficult in practice; as the same diseases may be either local or general. A better division of them is founded upon the apparent causes of disease. In this manner, we can divide them into four groups:—1st, Diseases arising from mechanical injuries; 2d, from the growth of parasitic plants; 3d, from a change in the external conditions of life; and 4th, from the influence of poisonous agents. To the first class belong all those diseases which arise from the accidental wounding of plants, the injuring of them by the various species of Mammalia, whether wild or domesticated, birds and reptiles, and the attacks of insects. To some of the diseases thus produced attention has lately been paid in Mr. Curtis's articles on Entomology. Wounds, however, frequently induce diseases, of which we shall have occasion to speak. To the second class belong the diseases produced both by flowering and cryptogamic plants. The former are not numerous, and of these the growth of the Dodder is probably most injurious in this country. The latter constitute a large group, and to them must be referred those destructive and frequently epidemic diseases known by the names of brand, smut, rust, &c. To the third class belong all those diseases which arise from the redundancy or deficiency of the various external agents necessary to the existence of plants, such as the ingredients of the soil, light, heat, air, moisture, &c. Among these is found a large number of diseases both general and local, which generally consist in a deficient or excessive development of the secretions of plants, or a change in their chemical character. It is to this class of diseases that we shall first more particularly devote our attention. To the last class belong all those diseases produced in plants by the action of injurious gases in the atmosphere, or of substances in the soil, which being taken up into the plant interfere with its healthy functions.

From the diseases of plants must be distinguished what are called monstrosities; the one may frequently run into the other, and it is not uncommon to find diseased plants exhibiting monstrous parts; but at the same time we do not intend to enter upon the subject of monstrous growths, which belong rather to physiological than to pathological Botany. In our next article we shall make some general remarks on the causes and on the treatment of the diseases of plants.

The extraordinary mildness of the latter part of the past year has had the effect of throwing most collections of Polyanthuses into premature bloom; consequently, the Amateur will experience some disappointment, at the usual time of flowering, from his plants being weakened, unless he has taken the precaution to remove the trusses as they appeared.

Taking into consideration the quantity of seed sown in various parts of the country during the last 20 years, the number of fine varieties at all approaching the standard of perfect roundness, combined with perfect lacing and bright colours, are very few indeed. Still we trust that the impetus given to raising seedlings, from the best flowers only, will extend to "this," one of spring's gayest attendants.

We well recollect the time when Tantarara was most extensively cultivated; and though a coarse flower, it had properties which we should wish to see more strongly apparent in many varieties which have been originated since that period. It was a strong and luxuriant grower, though, from the unfrequency of its appearance, we should imagine it lost to most collections.

Alexander, which we understand was raised from seed by the late James Lee, of Lenton, near Nottingham, and the stock purchased by the late Jno. Pearson, of Chilwell, some 30 years ago, still retains its prominent position, and has taken during that time more first prizes than any other variety in cultivation. Its body-colour is intensely dark, combining with a beautiful lemon eye a corresponding margin of the same lively hue.

In our time we have seen thousands of seedlings bloom from this favourite sort, but none that have yet come under our observation have been so good as the parent, being generally coarse and undecided in character. Had they, however, been crossed with Buck's George the Fourth, we should probably have had a different result; for were we to select a variety to save seed from, the above flower would most certainly have the preference. It may be said the body-colour is of a coarse reddish-brown, and that at times the edge or lace is imperfect; still its habit is good, being a magnificent trusser, joined to one of the most perfect shapes we have; and did it possess the jetty body-colour of Alexander, with the correct lacing and brilliant yellow of Hufton's Lord Rancliff, it would most assuredly come nearly up to our ideas of a perfect flower.

Amongst the few seedlings which have come prominently into notice, and found their way to the south, during the last ten years, are those which have been raised by the late John Hufton, of Shipley, Derbyshire. Taking them altogether, they are certainly of a superior cast. His Lord Rancliff is one of the most robust habit, and increases prodigiously. Its trusses are large, but its flowers individually are below the medium size; still its ground or body-colour is extremely dark, contrasting beautifully with its bright centre and perfect lacing.

Earl Grey (*alias* Clegg's Lord John Russell) is also of the same paternity, and a great favourite. This flower is remarkably neat, and a good and decided variety. Its defect is a slight foxiness or indistinctness where the body-colour breaks off at the centre. That is, however, almost imperceptible, except to the critical gaze of the experienced florist. The lacing is distinct and regular, the flower above the middle size, a fine trusser, and very robust and luxuriant.

Squire Ray (Hufton's) is quite of first-rate character, joining to all the good qualities of the preceding varieties a beautiful trumpet eye, or tube, well filled with thrums; but perhaps the gem of the collection is Hufton's Lord Lincoln, which unfortunately, like too many other good things in the same way, is delicate in its habit. It is of beautiful and perfect shape, with its other properties finely developed. Much confusion has arisen in Derbyshire and the neighbouring counties from the circumstance of a spurious sort having been put into circulation by unprincipled parties. The true one, however, may be readily distinguished by the heart-leaves being invariably small, and at the same time having a curled diseased appearance. As we intend to resume our observations on the Polyanthus very shortly, we shall close the present remarks by observing, that in the numerous catalogues of this flower which come under our notice, we miss several that some years ago gave us much pleasure in the collection of the late Mr. Thomas Hogg, of Paddington. If our memory does not fail us, they were Pearson's Wooden Walls, remarkable for its fine deep plum-coloured ground; Pearson's Harlequin, with a body-colour of shaded crimson, often coming, like Collier's Princess Royal, with six petals; Pearson's Commander-in-Chief, and Pearson's Competitor.

Should these varieties be lost, and we much fear it to be the case, as from inquiry we find that they are not now grown in the neighbourhood where they were raised, it will be much to be deplored, as they were all of fine habit and of good size, and were certainly decided acquisitions.—*W.*

To the honour of our country it may be said that all Charitable Institutions are sure of support if they deserve it, and it is no disgrace to British feeling if in some cases charity is misdirected. Such an array of Hospitals, Almshouses, Asylums, Schools, and Benevolent Societies as are maintained by private assistance in this kingdom is without a parallel elsewhere. We trust that every year their number will be augmented: for as wealth increases, so, alas! does destitution; indeed, the one is, we fear, the inevitable result of the other.

If there is any one class of persons more peculiarly an object of compassion than another, it is surely that of aged Gardeners, whose lives have been spent in contributing to the gratification of the wealthy, while their wages have been far too small to enable them to make suitable provision for old age; for it is to be recollected that a gardener is not a mere machine, like some classes of servants, but a man, who, if he is to maintain his station in his profession, must of necessity incur expenses from which the menials of a household are exempt. He must have his books—he must buy the current knowledge of the day—he must visit his neighbours' gardens—he must spend his little earnings in fifty things of which the eye of the public knows nothing, but all which draw heavily upon his very scanty resources; so that when the hour of adversity arrives, as it may to any one, he can have no resource to fall back upon. We therefore conceive that the Gardeners' Benevolent Institution, of whose recent meeting a report is given in another column, most peculiarly claims the sympathy and support of the wealthy classes: we wish we could say that it received it. Up to the present time, however, it has been mainly carried forward by Nurserymen, or by Gardeners themselves; for the contributions of other persons are too inconsiderable to deserve mention. Let us hope that those to whose comforts gardeners so largely minister, will now step forward and assist its funds as they already contribute to more fashionable charitable endowments. The little stock of about a thousand pounds, which a few poor persons have up to the present time amassed for the best of all purposes, the assistance of respectable old age, is less than is gathered at a single meeting of a fashionable hospital. The least possible move in favour of this charity among the wealthy would at once decuple its resources. Let us then entreat the great and wealthy not to wait to be canvassed, but at once to stretch forth their bountiful hands to the Gardeners' Benevolent Institution, of which none can be more deserving of substantial assistance. We shall be most happy to receive subscriptions and announce them in our columns.

While we say thus much for the English association for the relief of poor *and aged* gardeners, we must by no means omit to notice the existence of a similar institution in Ireland, which we are glad to find from a report before us is moving on satisfactorily, although very slowly. The committee of the Gardeners and Stewards' Provident Society of Ireland state that it is in "a most prosperous state," and upon reference to the published accounts, it appears that the receipts for the year amount to the sum of *ninety pounds* for all Ireland. If this constitutes prosperity, let the rich Irish landlords only consider how valuable to such an institution the smallest donation must be, and how easily they may win the gratitude of their fellow-creatures, at an expense, of the occurrence of which, even annually, they cannot by any possibility be conscious.

SEEDS OF GARDENING.—No. III.

(*Continued from page* 20.)

From oft-repeated examinations, I can assure you it is difficult to find perfect seeds, and still more so to find pure ones, that is to say, free of filth of every sort. And the more you examine your seeds, the more necessity you will see for ripening them off quick and clean, and canistering them in such form as neither moth nor mouse can come at them.

But as these remarks will, perhaps, have little weight with an extensive class of your readers, I must reason a little closer, and try to bind it, if possible, to the services of Horticulture by threads drawn from other

branches of art already familiar to the minds of all; but before any improvement is commenced, let me state the matter as it stands now. The seed-grower harvests the crop, and frequently, for a very sorry remuneration, hands the seeds over to the wholesale seed-dealer, who again hands them to the retailer, and in the stores and granaries of these gentlemen seeds generally get no good. About Christmas or soon after, seeds come into the hands of the users; and now they are placed on shelf and in drawer, in canvas bags or in brown paper, in an atmosphere cold and damp, or dry and musty, just as the shed or garret may chance to be where they are stowed; and the seed-rooms of many of our boasted garden establishments are like the sheds, or more properly sheilings, for the workmen and their tools, miserably mean and ill-arranged as regards furnishing, ventilation, and dryness. I could scarcely find a room in any of them that I am acquainted with fit to keep a bag of Kale-seed in; for a seed-cabin, or cabinet, should be dry without being hot, and ventilated without being open to wind and weather. This dryness and ventilation seems essential to the welfare of seeds to which the air has access, and cannot be overlooked with impunity in the keeping of loose seeds, of which the following are examples:—An ounce of Broccoli-seeds came to hand (not in a bag) in a square of brown paper, folded twice, turned up at the ends, and marked, in words more or less misspelt, with its quantity and name. This packet, with 11 others, had a brown-paper round them, and a string which turned the dozen out of the seed-shop very decently, but unfortunately only three or four out of the dozen had to be sowed at one time, and of these only a small portion, say half, or perhaps only one-fourth, leaving the rest in confusion, unseemly driblets dragged from the jacket pocket of the sower, in untied, ill-folded papers, liable to be upset by the wind, or wetted by the rain, in a basket on the ground, in the open garden; and this confusion is wonderfully increased when we consider that not a dozen, but little short of a thousand such packets go through a gardener's hands in the course of a season, and of these many are novelties, of which little is known, and that little only to a few; yet here they are, the gardener and his novelties, "alike unknowing and unknown." The Horticultural Society has long been in the habit of sending a printed label with the name and properties of the articles pasted on the samples of seeds sent to the Fellows annually. I am glad of this, for it serves as a precursor to a more systematic arrangement; thus far and no farther have we progressed, December, 1843. Now let us proceed anew.

Every packet of seeds that comes into the gardener's hands should be in tin boxes, each box having on the lid the name and date of the sowing of the seeds, and likewise a number or mark of reference to the name of the grower of the seeds; or, which is better still, a seal securing the safety of the package, stamped with a representation of the plant whose seeds are inclosed, and the initials or name of the grower or vendor who guarantees their quality. Such precautions would enable honest men to trace good things to their source, and bad ones to their author, and act upon the hints so gained in buying seeds for the future; and I can see no reason why seed-growers should send out seeds so slovenly to the world as to be liable to mixing and injuries of all kinds, whilst such as Curtis and Harvey send out gunpowder—of less value than garden-seeds—in close tin-cases, well wrapped in paper, and beautifully labelled with letter-press and picture, setting forth the manufacturers' address and specifying the uses and degree of fineness of the inclosed grain. Some foreign growers send Stock-seeds to this country in sealed red-leather pouches, so you will perceive that I am only wishing to perfect a system already begun. Supposing, then, the lid of the tin box containing seeds to stand thus—:

and the number 2213, to signify in the vendor's book the name of the person that saved the seeds, or else to have his seal; in which latter case his seeds would be encased before he sold them, and sealed to prevent imposture. But this is not all; for around the tin box there must be another label with the names, botanical and popular, of the article inclosed, with its character and uses according to the best practice; this would convey the information home to the user, and as the seed-grower is never loth to tell the seed-buyer the good qualities of the plants of which he has the seeds, there can be no difficulty in coming at the kind of information I speak of; and when once written, it can be printed for the veriest trifle now-a-days; and the cost and labour, with tin boxes and printed labels, will not be one whit more than under the present system of packages in canvas and paper for the following reasons:—The boxes in which Walker sends out 500 of his percussion caps came first to my hands as a likely sample-box. I weighed two ounces of Yellow Mustard, and found this small box (which I inclose) to hold it. I showed the box to our tinman and brazier, Mr. Mellow of Uttoxeter, and he said he could supply such at less than 1*d.* each. These boxes, therefore, may safely be taken as large enough for single ounces of ordinary seeds. The next tin box that came to my hands was one of Hill and Co.'s Presburgh wine-biscuit-boxes. I found it to contain nearly half-a-peck of Yellow Mustard, and the value of this box is 4*d.* Here, then, is a quart of seed canistered for 1*d.*, four quarts for 4*d.* Mr. Hill has, moreover, set forth some useful hints on his biscuit-labels. He says if the biscuits are "kept dry and in their packages, they will retain their delicate crispness during a long voyage; nor will the change of climate deteriorate them." Mark this; his bread is not mouldy for a year or two, because he packs it properly. Our herbs and seeds, if similarly treated, might fare the same.—*A. Forsyth, Alton Towers.*

(To be continued.)

THE ROSE-GARDEN.—No. I.

The best work on the cultivation of the Tree-Rose with which we are acquainted is one published in the year 1830, with the following title:

"PRACTICAL INSTRUCTIONS
FOR
THE FORMATION AND CULTURE
OF THE
TREE-ROSE,"
BY INOCULATION AND GRAFT UPON THE WILD BRIAR.
Illustrated by Twenty-four Woodcuts.

"Parva leves capiunt animos."

Notwithstanding its value, this work is scarcely known. Here and there an amateur possesses it, and appreciates its excellence; but by the majority of people it was never heard of. We have now the satisfaction to announce that the copyright has been purchased for the use of this Paper, in which the whole Volume will appear in the course of the year, in a series of weekly articles, with numerous corrections and alterations by the talented Author *A. H. B.*

"*Preface.*—When a traveller gives an account of the country he has been wandering over, he frequently delays writing his description until he has been somewhat accustomed to the place, its manners, customs, and inhabitants; and thus, instead of mentioning what struck him at first sight, and is, in reality, the most amusing and instructive, he publishes his work as a hard outline, deficient in those light shades and fine touches, without which his picture is unequal and incomplete.

"Thus it is with writers upon experimental subjects. They frequently suppose that a certain quantity of technical knowledge is previously in possession of the reader, and omitting some necessary part of their descriptions upon this assumption, the theory to the reader is incomplete, and baffles his endeavours to act upon it.

"With a desire to avoid these errors, the memorandums in the following pages have been noted down from time to time; they are the result of an examination of all the works upon the subject accessible to the Author, during a practice which commenced in perfect ignorance, and ended by almost certain success.

"The great inducement to collect together the following remarks arose from the observation of the frequent failure of common Gardeners, who usually act from practice alone, and therefore do not always vary their operations as often as the changeableness of the year and the nature of the place in reality require.

"A fact aptly illustrated by a failure in eleven cases out of twelve in the first experiment on this subject witnessed by the Author, though the operator was called an experienced hand.

"Be it observed, that while the Author acknowledges himself indebted for much matter, and almost entirely for arrangement, to works published upon the subject, especially to a small pamphlet lately published in France, yet it is upon his own practice and observations that he depends for his assertions, and from his own failures (partial or entire) that he endeavours to point out the deficiencies likely to prevent success, and the means and observations requisite to improve upon it.

"Amongst the amusements of the most refined and elegant minds, those which have some reference to the productions of Nature are perhaps the more satisfactory, both in practice and result.

"Ornamental scenery, the culture of exotics, the laying out of pleasure-grounds, &c., are matters which involve a considerable expense, both in commencement and continuance, though perhaps only indulged in to a small extent; but the *gradual* improvement of a place, by adding to the number of ornamental shrubs, filling up vacancies, &c., is an amusement, indulged at a less expense, requiring only occasional assistance, a little method, and a few implements for the purpose of propagating the species desired, many of which will bear to be transplanted repeatedly, and, costing little at first, are fit subjects of practical amusement to those who like to have such matters under their own especial eye, and are interested in them in proportion as they themselves can increase and attend to them.

"*Introduction.*—Amongst the ornamental shrubs in cultivation, the Rose has long borne the belle from its shape, permanence, the variety of its species, and the brilliancy of its colour; one thing, however, seemed desirable, viz., that the unneatness, as it were, of the plant should be corrected by its springing like most other ornamental shrubs (which are not feathered to the base) from a single stem. As well as that its height should place it above the other shrubs which (particularly evergreens) would otherwise hide, choke up, and injure the plant.

"The mode adopted to gain this point, which has also added to the beauty and regularity of the plant, as well as to the profusion of its flowers, (though it is said to have injured its durability,) will be treated upon in the following remarks, together with the means of preserving the health and improving the appearance of the tree.

"There appear to be but three reasons for entering into competition with mechanics in any branch of their work: the first, to effect our own purpose, with our own hands, and thus furnish ourselves with occupation and amusement; the second, to avoid the expense attending the labour of others; and the third, and more difficult, to improve upon the manufacture, by dexterity of operation, care in completion, and choice of material.

"I shall endeavour to show that these points may be perfectly obtained: the first, by the insurance of success to the operator from a clear and comprehensive view of the subject; the second, by a diminution of expense; and the third, by an evasion of those deficiencies which are the result of scanty labour and general inattention.

"The usual price of a tree Rose is from 5*s.* to 10*s.* 6*d.*, the materials required to make any quantity are few, of little or no value, and the Stocks* themselves are procurable in any number, at any price, in the country.

"Rose trees, properly treated, rarely perish in a good soil, and when they do, it is in general during the first season, and before any trouble has been bestowed upon the Stocks. As the Stocks will be picked, they will more than equal those in common use, and being subsequently budded upon, according to their size, health, and fitness for the species they are intended to carry, the success will be more complete than when no selection is made in the material, and the cultivation is confined to a demand for particular species, and the labour and time bestowed upon them, limited by a due regard to the per centage they are intended to return.

"The injury from wounds, also, being commensurate with the first planting the Stock in the salesman's nursery, the damage done to it by the time it has become ornamental is frequently irretrievable, and the tree vegetates weakly for a season or two, (especially if small,) and then dies, or is broken off by the wind. This, a careful attention to the following rules will effectually obviate."

(To be continued.)

LISIANTHUS RUSSELLIANUS.

This fine annual, introduced from Texas in 1835, is still uncultivable in the hands of many good gardeners; yet we occasionally see noble specimens on the exhibition tables near London, a sufficient proof that the plant may be grown well under proper management. Among the most successful cultivators of it is Mr. James Cuthill, florist, Camberwell, who has put into our hands the following account of his mode of treatment:—The best time to sow the seed is in March, and as the seed is extremely small it requires particular care. If deposited in the usual way, upon loose soil, the first watering carries the seed along with it, and hence the failure. Prepare the following compost—half loam, the other half leaf, peat, or bog-mould, with a little sand; place plenty of drainings in the bottom of a 48 or 32 pot, fill it with the compost very tight, and on the top place half an inch of sand; damp the sand with water to harden the surface, sow the seed, and sprinkle a very little dry sand on the top. Place a propagating-glass over the pot, or a piece of glass will do; place the pot in a heat of 70° or 80° with a pan under it for future watering; at no time water on the top; the pan ought never to be allowed to get dry. The seedlings will appear in three weeks or more; when about three weeks up, plant them singly in a 60 pot in the above compost, with plenty of drainings in the bottom. Place them again in the back of your Cucumber pit or frame; after this you cannot give them too much water over head and in the pans, and by the autumn, if they have been kept in a good growing heat, they will be fine little bushy plants. Top them at every joint; in September shift them into large sixties, merely to keep their roots in a more intermediate state for the winter; after this all top watering must cease, and a pan must be placed under each pot to receive the watering. As the winter approaches not a drop of water must be allowed to fall on the plant. The drier the top mould next the leaves and stem, the more certain of preserving the plant. The best place I have found is a one-light pit, heated with a lining of dung from 50° to 60°; air given front and back, so that no damp can fix on the bars and drop on the plants. The second best place is the coldest part of the stove, very near the glass. I have also kept them well in the warmest part of the greenhouse. In all cases water just sufficient to keep the plants from flagging—if the winter is dry, once a fortnight; if damp, once a month

* The first of these articles is the only one absolutely necessary; the remainder are the operator's luxuries.

or so. Towards the end of February place them in a Cucumber pit or frame, in a heat of from 70° to 75°, and when they begin a fresh growth shift them into as large pots as convenient, remembering the larger the pot, the finer the specimen; my largest plant had 600 blossoms on it, and was grown in a No. 8 pot. As the spring advances it is almost impossible to give too much heat and moisture. They are very fond of liquid manure. It is useless to grow a fine plant in any place approaching to dry heat, nor in less than 70° to 80°. I have grown them 5 inches in 7 days. In removing out of the pits, great care must be taken not to allow the sun to shine on them for some days, as the change from a damp close heat to a dry house will be too much for them. By the above treatment they will come into flower about the middle of July, and keep blooming from two to three months.

ENTOMOLOGY.—No. LIII.

The Elm-gall Aphis.—The Plant-lice are so familiar to the gardener, that to enlarge upon the mischief occasioned by them is quite unnecessary here. He will, however, find in a recent Memoir laid before the Royal Agricultural Society, the serious effects produced by some of the species upon the Turnip and Cabbage crops.* The Aphis before us is not one of those which blight the fair prospects of the cultivator; it merely disfigures the trees, and it is doubtful whether it be an inhabitant of this country; as however it affects an English tree, it may have escaped observation, and as the gall or nest is very remarkable, and has never been noticed in any British work, it will prove an interesting addition to our knowledge of this family of insects.

In my rambles about Rome I first observed these excrescences (fig. 1), and afterwards in the neighbourhood of Tivoli, I saw them abundant in hedges leading to Adrian's Villa; this was about the middle of June, and they were attached to the long young shoots of the Elms. They varied from the size of a Walnut to that of a large Apple, and were produced at the apex of the short lateral twigs, whose growth was thereby checked, the gall being formed at the expense of the leaves. These excrescences are very light, the external surface is exceedingly uneven, leathery, greenish, and not thick; being hollow, with a considerable quantity of fluid inside, and containing at that season multitudes of the Aphides. The fluid, which was perfectly limpid, flowed in great quantities from the galls of the specimens attached to the branches which I cut off, and when the liquid dried it became gummy.

The only gall which had previously come under my notice bearing any resemblance to this in its formation, was that of the Aphis Bursaria of Linnæus, which I shall describe and figure in a future Number; but the Cabbage-leaves become distorted and crumpled in a similar way by the operations of the Aphis Brassicæ Linn.† There seems to be three species of Aphides which affect the Elm-trees—one induces the leaves to roll up; another forms a stalked gall beneath the leaf; and a third causes large excrescences to be developed upon the buds. All these have been confounded by Linnæus and Fabricius under the Aphis Ulmi, but it may be fairly presumed that these galls and distortions, varying so greatly from one another, are the productions of as many varieties of the Aphides.

We will now describe the Elm-tree gall Aphis, which has been named by De Geer "Aphis Gallarum Ulmi." The rostrum is scarcely so long as in the genus Cinara; but it appears to be stouter at the base; the winged females are deep black, powdered with white (fig. 2), the antennæ are filiform and short, composed of several joints, elongated at the base, and decreasing in length to the apex; wings four, superior, very large, transparent, with a blackish oval stigma; nervures palish, forming an ovate marginal cell; the second furcate at the posterior margin, and not reaching the subcostal nervure; the other two oblique; inferior wings much smaller, with a subcostal and two oblique nervures; legs six, not very long but slender; tarsi short, biarticulate, terminated by two minute claws. The apterous females are brownish, the apex of the abdomen a little woolly; the ducts very small, forming tubercles only; legs and antennæ short; some of the old ones are broad behind, and powdered all over. The pupæ are more elongated, with the rudimentary wings closely applied to the base of the abdomen. To save space, and at the same time to make the object distinct, only one side of the insect is represented in the cut; but it has four wings and six legs; the crossed lines exhibit the natural size when the wings of the female are expanded, and it is presumed that the males are similar, but I have not met with that sex.

This species is allied to Eriosoma, from which it is readily distinguished by the forked nervure in the superior wings, and forms the transition to the genus Cinara,‡ but the oval stigma is a character not to be found in that group or amongst the Aphides.§ From its economy I expected to find it closely allied to E. Bursaria; but it does not belong to the same group, and it makes the nearest approach to a species with a black stigma, which I find flying about Fir-trees in great abundance, and this may prove to be the A. Pini of Fabricius; but as I am unable to determine this from his vague description and confused synonyms, I have called it C. stigma. Until the Aphides have been more completely investigated by scientific men, we must refer the "Elm-tree gall Aphis" to the genus Cinara, in which, with the C. stigma, it will form a section, having a thickened oval costal spot; from its structure we may also learn that this group ought naturally to follow the Eriosomata of Leach, and that the true Aphides should not intervene, as they do in "Curtis's Guide." ‖ The typical Eriosomata were thus characterised by the late Dr. Leach:—"Abdomen without tubercles or horns; antennæ short and filiform; body tomentose." He adds—"The Eriosomata form what are called improperly galls on the stalks of trees near their joints, and knobs, which are in fact excrescences caused by the efforts of nature to repair the damage done to the old trees by the perforation of those insects whose bodies are covered with down." As an example of this genus he gives the E. Mali, which is the Aphis lanigera of authors, and the American blight of gardeners.—*Auricola.*

BEES.—No. III.

(*Continued from page* 21.)

Though Bees can be easily prevented from swarming, yet it is not profitable to do so: indeed all systems that prevent swarming are bad and uneconomical. The systems of Dr. Bevan and Mr. Nutt ought to be eschewed by all means. Generally speaking, two swarms ought to be taken from almost every stock-hive every year. In an extraordinarily rainy year it may be injudicious to take a swarm at all, particularly from those that were very weak in the spring months. The period of the year at which swarming should be prevented will vary according to the season and locality. In Middlesex, for instance, hives cease to increase in weight about the beginning of September. Where this is the case no first swarms (whether virgin or not) should be taken later than the middle of July.

Swarming is prevented by augmenting the hives, and the most profitable modes of doing it shall be noticed by and by. At present I would chiefly direct attention to the artificial system of swarming, which supersedes the natural system. It is thus accomplished:—Blow a little smoke from a bit of fustian or corduroy rolled up in the form of a candle (which ought to be used in handling hives) into the hive, place it on the ground inverted, a few yards from the stool—put an empty hive on it, and fasten a cloth round about the hives to keep in the Bees: the hive prepared to receive the swarm must now be placed on the board whence the stock was taken: then drum or rap with open hands on the bottom hive for the space of 8 or 10 minutes—untie the cloth, take off the upper hive, and put its crown on the ground. Spread the cloth over the combs of the old hive, and now look amongst the Bees which are thus drummed up for the queen. As soon as you see her, give the hive a violent shake, and tumble the swarm into the struck hive, in the same way in which you would put Peas out of one basket into another. If too many Bees are drummed up, put the queen into the struck hive with a spoon, or your hand, in order that she may not be amongst those that are returned to the stock-hives. So many Bees as will barely cover the combs ought to be left. Place the colony a yard to the right—the stock a yard to the left of the old stool. You need not be afraid that the Bees will not hatch queens, and that it requires a greater degree of practical adroitness to accomplish this than you possess. All that is necessary is a willing mind. This system has, for more than 30 years, been adopted in one of the largest and most profitably managed Apiaries in the British Empire. It is impossible to form an adequate conception of the advantage of the artificial over the natural system. When the artificial system is adopted, no swarms are lost; Bees are prevented from clustering and mispending their time outside, attendance is rendered unnecessary, more second swarms are obtained, and the honey may be taken from the stock on the 21st day from the time the first swarm was taken off, without either Bees or brood being destroyed.

While I would recommend this system of artificial swarming, I would condemn that system which Dr. Bevan has recommended at p. 157 of "The Honey-Bee." His system is the following:—"Towards noon of a fine day, or almost at any time, if the Bees cluster out much, let a stock-hive be removed to a distance, and a spare hive or box be put in its place, to one bar of which is attached a comb containing workers' eggs, or very young larvæ of the same sex; the outliers, or the Bees that are abroad, or both, as the case may be, will then enter the new habitation, cluster round the brood, construct one or more royal cells, inclose one or more eggs, and raise a young sovereign; and thus, if the season be favourable, form a flourishing stock." I doubt very much whether this can be accomplished; for the Bees, if thus dealt with, would raise two or more sovereigns or princesses, and with one thereof send off a colony on the 18th day after the eggs were set—that is, on the 4th day after the princesses are matured. In some cases a swarm may not issue, but even then it would not "form a flourishing stock," for the combs constructed under these circumstances would consist chiefly of drone-cells, the Bees being apt to construct this sort when they have one or more queens in embryo. In taking off second swarms a little caution is necessary, for if the queens should be matured they will burst out of their cells as soon as you begin to rap, and it may happen that all of them go with the swarm; but by taking a swarm off as soon as one queen only is matured, attendance becomes unnecessary, and the queens take the drone, and consequently commence to lay two days sooner.

Some Apiarians think that it is not profitable to take second swarms, but all who keep their Bees in large hives think differently. When you come to know that, if Bees are kept in large hives, every family, in fair weather, before the first swarm is taken off, gathers from two to five pounds of honey every day, you will say with me that artificial swarming is, in a pecuniary point of view, the greatest invention that can be found in the annals of Bee-history; and that it is extreme folly to allow Bees to cluster and squander their time about the door of the hive. Lady Apiarians who are unable to take off swarms would do well to employ some person who is able to do so for them, though he charged half-a-crown for the taking off of every first swarm.

Second swarms do not leave the hive from want of room; and for this reason, augmenting the hives will not prevent their coming off. Cutting out all the princesses but one (when they are in their cells) will prevent a second or third swarm from being thrown, but this cannot be accomplished in every hive. To be sure, throwing a swarm of this sort back will cause it not to issue again, at least in 99 cases out of 100. But about the second or third week of July, which is the time to prevent swarming, there are plenty of queens ready, or nearly ready, to burst out of their cells, either in your own or your neighbour's hives. Well, then, whenever you take off a first swarm, about the middle of July or earlier, if you do not want a second swarm, cut out of another hive a cell that contains a queen, and put it in the hive whence the swarm was taken. If the queen be matured, take off the lid of the cell and let her run into the hive; but if she is not fully ripe turn up the hive and fix the cell between two combs. This is an item in Bee-management of first-rate importance, for the queen, thus introduced, will soon begin to lay; whereas, if the Bees had been allowed to rear a queen, there could not have been any eggs laid sooner than the 24th day from the time the swarm was taken off. If stock-hives are about 40lbs weight when the first swarms are taken off, it is advisable to let the Bees rear queens, in order to obtain the honey before the young queens commence to lay. The Bees of stocks are put into second-swarm size hives, and are termed "turn outs." Sometimes the stocks are kept in a garret, or in some out-of-the-way place without Bees till September, when they are brought to the Apiary and furnished with Bees.—*A. Pettigrew, Wrotham Park, Middlesex.*

Home Correspondence.

Pseud-Acacia.—I saw in the *Chronicle*, lately, a communication from Mr. P. J. Selby, respecting the Pseud-Acacia, and as I was some years ago interested in shipping I paid much attention to the qualities of the timber of which vessels were constructed; it was at that time the highest recommendation of an American vessel to be built of "live Oak, Locust, and Cedar." The late Mr. Cobbett, who was so energetic in his recommendation of the culture of the above tree, was perhaps not aware of a fact well known to many of the ship-builders of New York, viz., that the durable properties of the timber depend very much on the soil and situation where it is grown; and his experience of it was probably derived from his residence on Long Island, a great part of which is well adapted to produce the qualifications which he attributes to it. The situation best calculated to give to this timber the property of durability is the vicinity of the sea, and I believe that Locust timber, grown out of the range of the immediate influence of the sea-breezes, will not have the property of durability in the perfection described by Mr. Cobbett. The size to which it attains, and the rapidity of its growth under favourable circumstances, (probably of a rich alluvial soil), I do not think was more exaggerated than was usual in the writings of the above author, who was noted for taking a sanguine view of every subject and for writing in a strong nervous style; and to its durability I can bear testimony, from experience of the state of treenails (wooden bolts) which had been upwards of 20 years in a vessel, and which were so sound as to admit of being backed out by means of an iron drift bolt when the vessel was brought under repair. From the straightness of its growth in the lengths (15 inches to 3 feet) generally used for treenails, and from its property of splitting truer to a size than most other woods, coupled with its durability, it is a favourite fastening for vessels. The Acacia or the Locust is not singular in its fondness for the neighbourhood of the sea. The Live Oak, it is well known, flourishes best—nay, it is seldom seen of any size elsewhere—on the coast of South Carolina and Georgia, and more especially on the small islands which are so numerous along the coast between certain latitudes; in fact, wherever the "Sea Island Cotton" flourishes, the Live Oak is in the greatest perfection.—*Acacia.*

Orchidaceous Plants.—At p. 7 of the *Gardeners' Chronicle* "D. B." states in the Calendar of Operations, that Orchidaceous plants "need not be watered or enticed to grow for a long time." I should like to know how long he means. It is not only a duty incumbent on every gardener to study, as it were, the nature of his plants, but also to become acquainted with the changes of

the seasons to which they are subjected in their native countries, and it is a matter of great importance to know the length of the different seasons suitable for the Orchidaceæ generally cultivated in our stoves. In Brazil, Mexico, the East Indies, &c., where many of them are found, their season of rest is rarely more than six weeks, when they begin to put forth young shoots; and this, according to the laws of nature, shows that they require with us an early season of growth, in order to have light and heat to mature their pseudo-bulbs after they are of proper size. Therefore, owing to the shortness of our summers, Orchidaceæ ought to be encouraged to grow early in spring, and receive their season of drought as early in autumn as possible. This I find to be much more advantageous than if they were in a growing state in the month of November, when water must be withheld, to keep the unripened bulbs from damping off. Were I to act according to "D. B.'s" directions, and begin to entice my Orchidaceæ to grow in the month of May, which I imagine to be "a long time," next year I should have young shoots damping off, pseudo-bulbs shrivelling, and the plants one-third less than what they were last year.—*Radicum Fibræ.*

Destruction of Snails by common Salt.—Having strewed some common salt upon the ground, I placed a number of snails amongst it; all those that came out of their shells and touched the salt, immediately threw out a greenish globular froth, and in a few minutes were dead. I think this fact may be turned to some account amongst farmers and gardeners.—*J. M. T., Hillsborough.*

Twine for fastening Wall Trees.—In training plants and fruit-trees to the wall I have for some time used twine dipped in linseed oil, and dried, instead of bits of cloth; it is neater, more convenient, and affords no harbour for insects. Drive the nail into the required place, slip a tie with the twine over the head, bring the branch down and secure it with a knot. A tree secured in this manner is capable of being better trained, the branches better secured, and the whole appearance more workmanlike.—*J. G. B., Exon.* [We perfectly agree that twine used for that purpose would have a neat appearance and offer no harbour for insects, but it is objectionable because it is apt to cut the branch, and is on that account very productive of canker; it would also occupy much more time to fasten a tree to a wall with twine than by the common mode of using bits of cloth.]

Cure for Old Walls, &c.—The walls here are very old, and having had trees nailed against them for probably more than a century, they were covered with multitudes of nail-holes, and in those holes, no doubt, were numbers of insects ready to emerge and infest the trees. In spring it occurred to me that a wash for the wall would be of greater service than one for the trees; I therefore prepared a mixture of lime and Roman Cement, in equal quantities, in a fresh state, adding sufficient water to make it of such a consistency that it might be applied with a brush. This paint was put on in a fine day after the trees were pruned, and before they were nailed; this is the time I find most convenient for applying it. A great advantage in using this composition is, that it does no injury to the trees themselves. In order to ascertain this, I selected two young Peach-trees that had been the previous year severely attacked by green-fly, so much so that the trees were nearly dead; these I covered with a thick coating of the mixture, and in the following spring they burst through the paint with more than ordinary vigour. They are now as healthy trees as could be desired. If the walls are very bad, two coats of the mixture would be better than one; and if it is desirable to make it a little darker or lighter, the use of a larger proportion of lime or cement will effect the object. The inventor of the "Metallic Anti-corrosion Black Paint" strongly recommended to me that material for the purpose of painting the walls, adding that the fruit ripened a fortnight earlier on walls so painted. I am much afraid that by exciting the blossoms too early they would be more susceptible of injury by frost; but I have no experience in the matter, and should feel obliged for information respecting its application to walls.—*E. A. Hamp, South Lambeth.* [It does not answer to excite wall-trees unless some efficient protection is at the same time provided. But we doubt the fact of any kind of coloured paint advancing the maturity of fruit a fortnight. The experiment was fairly tried some years ago, and no advantage was discoverable.]

Kennedya Marryattæ.—This is one of the best conservatory climbers, it is always graceful, and I never saw an insect infest it. It cares not for shade or sun; at the present time I have one covered with scarlet Pea-flowers, many of which have been expanded for three weeks, and many more buds have yet to open. Tropæolum pentaphyllum is also an excellent plant for the conservatory. I beg to confirm what Mr. Beaton said about not opening the upper lights of a conservatory. If they are kept close tropical climbers will bloom in perfection therein; last year I had Mandevilla suaveolens, Ipomœa Learii, Passiflora alata, in fine blossom during summer and autumn in a close house.—*Flora.*

Rhizomorphas.—The inclosed root is found by labourers, trenching ground to a considerable depth; it is apparently unconnected with any vegetable growing on the surface. It is not found in any particular soil, nor in the immediate neighbourhood of trees. One of the workmen says he has found it in light sandy soils, but that now sent was dug up in rich loam. The inclosed specimen is not so tough as some that are found, but it always has a dead appearance. Could you kindly afford any information respecting it?—*Electra.* [This plant is probably much more common than Botanists suppose, for this season has produced many specimens which have come under our observation. It is a fungus, called Rhizomorpha medullaris, concerning whose habits very little is known to Botanists.]

Hammond's Cape Broccoli.—A correspondent, "W. N." informs us that, seeing this Broccoli advertised in the *Chronicle* last spring, he purchased two packets of it, and sowed it at three different times; the plants all proved to be tender, although they were stated in the advertisement to be hardy enough to stand the winter. "W. N." imagines that he has not got the right kind. Will some of our readers say whether it stands the winter with them?

Cause of Mildew.—Having seen at p. 823 of the *Chronicle*, remarks by Mr. Wighton on the cause of mildew, I am induced to offer my opinion on the subject. Mr. W. observes,—"Supposing six practical gardeners were asked the reason why their Peach-trees were mildewed, they would most probably all assign it to different causes." He then states the supposed causes, viz.:—"Dry or damp situations, strong or light soils, or a Fungus either on the roots or on the branches." It is true that there is, perhaps, no subject connected with gardening on which the opinions of gardeners are more at variance than that of the cause of mildew. I do not, however, attribute it to any of the above causes. I believe that the Fungus which we call mildew on trees is not the cause but the effect of the disease, and that the disease is occasioned by a sudden transition of temperature. In my practice in Peach-forcing I have had no cause to complain of mildew, when the night temperature was kept in due connection with that of the day; but even under glass, without the application of artificial heat, I have had Peach-trees as much injured by mildew as any that I have ever seen upon the open walls. It must have been observed by every gardener, that the disease is most prevalent in spring and early in summer. At that season it is not uncommon here to have our temperature varying from 30° to 70° in one day. From the effects of low temperature the sap of the tender shoots becomes congealed, and when it becomes suddenly warmer this congelation is too quickly liquefied, and in place of circulating through its regular channels, it bursts forth through the pores of the young shoots and leaves, and the Fungus-like substance immediately follows. If the disease was occasioned by anything but variation of temperature, the result would be the same every year; but this is not the case, for we find trees and other permanent plants, the one year totally escaping the disease and the next almost destroyed by it. This goes far to prove that variation of temperature is the sole cause of the disease. Consequently there can be no preventing it, where there is no control over the temperature. Sulphur is sometimes applied as a remedy, and it kills the Fungus; but this, as above stated, is only the effects of the disease. Some imagine having destroyed this, and soon after perceiving their trees beginning to grow again, that they have effected a cure; whereas, in reality, this new growth is entirely the result of a more genial temperature.—*J. Gavin, Donibristle Park, Fifeshire.*

Societies.

HORTICULTURAL SOCIETY.

Jan. 16.—R. W. Barchard, Esq., in the chair. J. Stewart, Esq., M.P., was elected a fellow of the society. From Mr. W. P. Ayres, gardener to J. Cook, Esq., were two remarkably fine specimens of Epacris nivalis and impressa. Both plants were about 6 feet high and 3 feet in diameter, and were uniformly covered with blossoms. Mr. Ayres states that the treatment which they received during the past season differed much from what is usually considered proper for this tribe of plants. Instead of being grown in an airy greenhouse, they were subjected to a close moist heat of from 60° to 90°, with no more air than was necessary to keep the heat from exceeding what is above stated. After sunset, especially on dewy evenings, air was freely admitted; but the plants were syringed, and the house was closed before the sun came upon it the following morning. The rate of growth was said to be so rapid that to keep the plants from flagging they had to be shaded during bright sun-light. Many who saw them during summer said that they would not set any flower-buds; but the result proves that a fine show of flowers is not incompatible with luxuriant growth, provided the precaution is taken to get the young wood properly matured before winter: a Knightian Medal was awarded for them. Mr. J. Robertson, gardener to Mrs. Lawrence, sent an exceedingly fine specimen of Epidendrum nutans, about 7 feet high and 3 in diameter, bearing nine main-shoots covered with greenish blossoms; this is an old plant, and well known, but it is very rarely seen in such perfection as in the present instance, and is an evidence of what good cultivation and management can effect. There was also from the same collection a pretty plant of the showy Lælia anceps, having long slender flower-stems, on the points of which were situated its bright lilac and purple blossoms; likewise a plant of the scarce Cypripedium barbatum, and one of C. venustum, along with well-grown plants of Phaius Tankervillia and P. intermedius. Mr. Robertson also exhibited a pretty plant of Lælia autumnalis, and a well-grown specimen of Centradenia rosea; the latter, from Sierra Leone, is a plant of easy cultivation, and is exceedingly beautiful when covered with brilliant rose-coloured star-like flowers. It has likewise the good property of being a free bloomer. Plants of Batemannia Colleyi, Aspasia epidendroides, and Zygopetalum crinitum from the same collection, were also sent for exhibition; a Knightian Medal was awarded for the three first plants. Mr. R. Plant, gardener to J. H. Schröder, Esq., sent a fine specimen of Coryanthes maculata, having a pendant scape of about one foot and a half long, at the end of which were three fully expanded large ochre-coloured blooms, beautifully spotted with purple. From Mr. S. Gad, gardener to T. J. Lenox, Esq., was an exceedingly well-grown specimen of Clerodendron splendens, having fine fragrant scarlet blossoms; this is one of our prettiest twining stove plants, and under good management it is an abundant bloomer; a Banksian Medal was awarded for it. Messrs. Veitch and Son, of Exeter, sent a small plant of a Gaultheria, named ferruginea, having considerable resemblance to G. Shallon; it was imported by Mr. Veitch from the Organ Mountains, through Mr. W. Jobb; the plant exhibited had been standing in a cold pit, and Mr. Veitch states that he has one planted out in the open border, and considers it sufficiently hardy to stand our climate. Mr. R. Ayres, gardener to C. L. Stephens, Esq., of Roehampton Grove, exhibited three sorts of Cucumbers, one of them the "White Spine" was a good fruit considering the season of the year; a certificate was awarded for them. From Mr. Beck of Isleworth, were good specimens of Ashmead's Kernel Apple; this is a very valuable hardy variety; it is much in the way of a Nonpareil, and from its being a great bearer, as well as on account of its general excellence, it is worthy of a place in every cottage-garden. Mr. Buck, of Blackheath-gardens, sent three sorts of seedling Pears, numbered 2, 15, and 18. From G. Crawshay, Esq., of Colney Hatch, were specimens of Black Hamburgh Grapes that were cut on the 15th of January; they were good bunches, with well-swelled berries; and although they had been grown in a Vinery without the aid of fire-heat, they were perfectly ripe and well-flavoured; he also exhibited a bunch of the same sort that was cut on the 4th of December last, and had kept in good condition hung up in a room; the berries were not at all shrivelled nor the stalks decayed. Mr. Crawshay grows his Grapes, as before stated, in a Vinery where no fire-heat is employed, except in very dull damp weather; small fires are occasionally lighted, not to increase the temperature, but merely to dry up the damp; the Vines are allowed to have great ventilation, and from this circumstance the Grapes are well ripened, which is the great secret of their keeping; a certificate was awarded for those cut on the 15th January. J. Moorman, Esq., of Portland Place, Clapham-road, sent a collection of Pears, among which were specimens of Napoleon and Passe Colmar in good condition: a certificate was awarded for them. From the Garden of the Society were flowers of Chimonanthus fragrans and grandiflorus, with a collection of Apples, consisting of Court Pendu Plat, Reinette du Canada, Cockle Pippin, Pomme Royale, Boston Russet, and Golden Harvey; the latter is one of the best sorts in cultivation, in richness and delicacy of flavour it is even superior to the Golden Pippin; it is also remarkable for being an excellent Cider Apple. The tree is perfectly hardy; it is a good bearer and worthy of a place in every garden. From the same collection were likewise sent the following Pears, viz.: Easter Beurré and Beurré Rance, the latter were from standards; this Pear, although not so large, is found to be much better flavoured when grown in this way than when trained on a wall, unless a south aspect can be afforded for it. There were also specimens of Winter Crassane, an excellent variety raised by the late Mr. Knight; it not only resembles a Crassane in appearance, but also in flavour. It is a most abundant bearer, and so perfectly hardy that it does not at all require the help of a wall to bring it to perfection.

LINNEAN SOCIETY.

Jan. 16.—Edward Forster, Esq., in the chair. Dr. Thomas Harrison, Dr. Wm. Francis, Dr. Hamilton, Dr. Clement, and John Camplin, Esq., were elected Fellows. A specimen of the flying fish was presented by Mr. Green. Joseph Janson, Esq., presented specimens of the Sphæria Robertsii and of the fruit of Cheirostemon platanoides. An extract of a letter to Dr. Bostock from his son was read, giving a detailed account of a flight of locusts which he had witnessed in India, between Cawnpoor and Agra. The number of locusts was so great that the air became quite darkened. They appeared to be moving at about the rate of four miles an hour, and although the travelling party were moving in an opposite direction they were between two and three hours in passing through them. Professor Edward Forbes read a paper on the Echinidæ of the Ægean sea, of which he had found 12 species when accompanying Captain Graves in H.M.'s ship Beacon. The most remarkable of these were a new Amphidetus, allied to the A. cordatus, and the Echinus monilis, identical with the form of that name found fossil in the tertiary beds of Europe. The species were dredged up from depths varying from one to 100 fathoms. In the description of Amphidetus he gave an account of the eyes of that genus, which he had discovered surrounding the ovarian foramina, and which are protected by eyelids formed of regular circles of spines. He gave an account of the habits of Cidaus histrix, which he had taken in 70 fathoms water, and which has the power of climbing up corals by means of its spines alone, a fact not previously observed. The Echinus lividus is used as an article of food by the Greeks, and is identical with the Irish sea-urchin which perforates rocks. The paper was illustrated by diagrams, and was read by the Professor himself.

GARDENERS' BENEVOLENT INSTITUTION.

January 11.—John Sangster, Esq., in the chair. The report of the committee was read, by which it appeared that during the last twelve months "they had elected two pensioners on the funds, at 16*l.* per annum; they had given notice of another election to take place that day, and also recommended that three more pensioners should be placed on the list, the election to take place in June next; they had also purchased in 3 per cent. Consols 200*l*, making the total of 800*l.*, standing in the names of the Trustees of the Society. There was a balance in the hands of Messrs. W. and J. Noble, the Treasurers, o

12l. 1s." The report was carried unanimously. The meeting proceeded to the election of six committee-men, in room of those who go off by rotation, when the following were proposed and elected, viz. :—Messrs. Isaac Finmore, gardener to the Archbishop of Canterbury; James Thomson Seedsman, Fenchurch-street; John Henderson, Nursery, Pine Apple-place; Hugh Low, Clapton; John Lee, Hammersmith; and John Murray, Strath Isla Cottage, Bow-road. The meeting then proceeded to the election of two pensioners, Mr. John Henderson in the chair, Messrs. A. Chandler and J. Sangster being scrutineers; when James Anderson, aged 72, and Ann Potter, aged 60, were severally elected. About 60 friends of the Society afterwards dined together, when the Secretary announced the following donations :—Messrs. W. and J. Noble, second donation of 10*l.* 10*s.*; Wrench and Sons, 10*l.* 10*s*; George W. Norman, Esq., 10*l.* 10*s.*; Finlay Fraser, Esq., 10*l.* 10*s.*; Professor Lindley, 5*l.*, and a number of annual subscriptions and donations, amounting in all to 80*l.*

Reviews.

Rivers's Descriptive Catalogue of Pears is a list of the varieties cultivated in the author's Nursery at Sawbridgeworth, with a brief account of their qualities, and some very useful practical instructions in root-pruning. Mr. Rivers's collection is one of the best in the country, and contains, what is unusual, all the best varieties grafted on Quince-stocks. There are also many kinds collected by him in France, unmentioned in the Horticultural Society's Catalogue, and said to deserve cultivation. This little pamphlet merits the attention of fruit-growers; we believe it is given to the author's customers.

Species Filicum; being Descriptions of all known Ferns; illustrated with Plates. By Sir W. J. Hooker, K.H. Part I. 8vo. Pamplin.

In these days, when men are beginning to appreciate the importance of Ferns, this book is most welcome. It is not merely the Geologist, who finds their value as a means of identifying the age of the rocks which he has to examine, nor the Botanist who sighs for some efficient means of classifying the heaps of these plants with which his herbarium is loaded, to whom such a work is acceptable. The Gardener who—in a small way by means of Ward's cases, and on a large scale in his damp stoves and greenhouses—is able to perceive the beauty of Ferns, will also think Sir W. Hooker's book a welcome addition to his library: for here he will find his favourites described, their technical characters canvassed, and the rarer species illustrated by excellent drawings on stone. A mere systematical work admits of no extract, we can therefore only recommend this to all who are interested in the matter, as a publication with which they cannot very well dispense. We only wish that we saw a probability of the fossil Ferns being examined critically and incorporated with the modern species.

GARDEN MEMORANDA.

The Fence, Macclesfield.—The Orchidaceous plants here are looking remarkably strong and healthy. The method of supplying moisture, which is described at p. 191 of last year's *Chronicle*, appears to answer the purpose exceedingly well. The plants are neatly arranged in various forms; some are growing in wire baskets and some are on wooden blocks, or rough bark, suspended from the roof; others, of a dwarf habit, are placed in collections upon large pyramidal blocks of wood neatly covered with bark and Moss. The majority of the finest plants, however, are placed upon inverted pots in leaden cisterns from two to three inches deep, which are always full of water. The heating apparatus is so constructed as to fill the house with steam (at any time when wanted) in less than five minutes; so that by this means, along with the vapour that arises from the water in the coolers, a moist growing heat is maintained. The temperature of the house is kept up to 75°, but 65° is considered to be sufficient for the growth of the greater part of Orchidaceous plants, although a few will succeed better in a higher temperature. There is a beautiful plant of Ipomœa Horsfalliæ trained along the roof; this is now covered with crimson flowers. Besides this, the following plants are now in bloom :—Gongora speciosa and G. maculata; Lælia albida and L. acuminata; also Dendrobium Calceolus, Brassia caudata, Zygopetalum intermedium, Sophronitis cernua, and Odontoglossum pulchellum, &c.—*F. H., Jan.* 12.

Miscellaneous.

Improvements with regard to inducing Trees to form Roots, so as to render them independent of the Stock.—M. Albret remarks that Pear-trees, more particularly those grafted on Quince and Apple trees, on Doucin and Paradise stocks, derive great benefit when roots are emitted above the graft,—particularly in soils that are unfavourable for the longevity of these trees. It therefore becomes desirable to assist or induce the formation of such roots artificially as follows :—When a plantation of these trees is made, the grafts should be from 2½ to 4½ inches below the surface of the soil. Two or three years after, in summer, when the sap descends in greatest abundance, which is generally the case in July, the soil is removed, so as to expose the point of junction of the graft and stock; and immediately above this, several portions of bark are removed with a sharp gouge, about 4-10ths of an inch wide. The wounds are made in a perpendicular direction, and about an inch in length; their form, from that of the instrument, being concave, and so deep that a portion of the inner bark may be removed; and their number should of course be increased according to the size of the tree, but so that not more than one-fourth of the bark shall be removed. (Hence four portions nearly half an inch in width, and an inch in length, would be removed at equal distances from a tree 8 inches in circumference.) The wounds must be immediately covered with rich soil. Two quarts of decomposed cow-dung, and six quarts of maiden-loam, well mixed, form a good compost for the roots to strike into in the first instance. It is to be regretted that this mode of invigorating the trees in our gardens and orchards has not been hitherto employed. Some that have struck root naturally from above the graft may be seen growing with remarkable vigour, whilst others adjoining, living only on the stock above which they form excrescences, languish during a short existence. This mode ought to be adopted for all grafted trees destined to live in a light hot soil.‖

Progress of Vegetation in the Spring and Summer of 1843.—M. Pépin remarks in the "Revue Horticole," that the spring of this year has been very favourable for the growth of hardy plants, more especially those growing in calcareous and sandy soils. The trees which had been planted in 1842, and which had suffered much from drought, pushed with great vigour, as did likewise those recently planted. In many instances the straw of Rye was twice the length it usually attains; and the same may be said of the stalks of Beans and haulm of Peas. The common Fox-glove, and the white variety of the same, were among the plants observed by M. Pépin as exhibiting remarkable luxuriance, their stems attaining the height of nearly 10 feet. The rains which fell so abundantly in May and June mainly contributed towards this state of vegetation. But, on the contrary, the cool and humid state of the weather was unfavourable for exotic vegetation, for it was remarked by amateurs and caltivators of ornamental plants, that such as were planted out from under glass, produced, in a lingering manner, very imperfect and badly expanded bloom.‖

CALENDAR OF OPERATIONS

For the ensuing Week.

I.—HOTHOUSES, CONSERVATORIES, &c.

Stove. — A few plants will now or soon begin to grow in large collections. Some time ago this used to be the first note of preparation for potting, but now few gardeners will pot or shift plants for the next six weeks. A good criterion for the time of spring potting any plant is, when the roots are observed to grow freely. It follows, therefore, that plants which are grown in bottom-heat will require shifting much sooner than those on shelves. Pruning, more or less, is necessary for almost all plants, and the time for this work is regulated by that when the plant is expected to flower. One gardener by that when the plant is expected to flower in May—a second does not wish to have it in flower until July, while a third is endeavouring to keep the same plant from flowering until September. He who flowers his plants nearest their natural time will of course have the most success. Little water should be given during this month, and the house should be kept at a low temperature.

Conservatory. — Orange-trees that have been forced last spring, and kept in-doors all summer, will now begin to grow; and if they are in good condition they will flower freely on the young wood and little side-spurs. In order to get them into regular shapes, the strongest shoots ought to be stopped occasionally with the finger and thumb; not, however, until after the flowering is over. March is time enough to repot established plants of these, but young ones in small pots may be shifted now, and turned into bottom-heat in the forcing-pit. No plant delights in bottom-heat more than the Orange, and few plants which will live over the winter in a low temperature like it, will stand more stove-heat at all times when treated as a stove-plant. Another peculiarity noticed in the Orange is, that it requires less earth to grow in, to produce heavy crops of fruit, than any other plant of the same size; bad drainage and too large a pot would soon injure the best Orange-tree in the country. Avoid as much as possible letting in strong currents of cold air at this season, even when going in or out by the door; but in mild weather you may give air for several hours in the middle of the day. Water early in the day, and keep the plants constantly clean from dust or insects.

Greenhouse.—The grand point to attend to in this house is to keep the plants from growing till as late in the spring as possible; such plants as show a disposition to grow early should be removed to the coldest part of the house, or to cold frames in mild weather—anything rather than an early spring growth, unless for some special purpose. As fires are seldom wanted for drying up the house after this time, as little fire-heat as possible should be used, and any covering at hand to throw over the glass in frosty weather will lessen the necessity for strong fires, which, besides the economy of saving coals, is much better for the health of the plants. Pelargoniums and Cinerarias require more heat than the woody greenhouse plants, and are kept in houses by themselves in nurseries and large establishments, but where there is only one house for the whole these may be kept in the warmest end.

Forcing Pits.—Rendle's tanks are excellent contrivances for forced flowers; from 70° to 75°, or even 80°, of regular bottom-heat, day and night, may be kept up in the forcing-pits. The surface-heat may be regulated by ventilators, from 55° to 80°; but it may be allowed to rise a little higher by sun-heat; too much heat applied at first is sure to end in disappointment. Roses of all sorts do better when first brought into a temperature of 55°, with a bottom-heat of 75°, and not to pass 60° till all the eyes are fairly started. A dry atmosphere is best for very early forcing; we can always supply moisture as we think necessary. Recently-built pits, and especially where tanks are used, are troublesome for this branch of gardening, owing to the quantity of moisture they produce.—*D. B.*

II.—FLOWER-GARDEN AND SHRUBBERIES.

Out-door Department.

Where any of the beds in the flower-garden require the soil to be renewed, frosty mornings offer an opportunity of doing the work cleanly and expeditiously. By far too little attention is paid to trenching and draining flower-beds; it is surprising how much better tender plants support the summer drought in beds that have been trenched than in those that have been merely dug.

Reserve Garden.—Any of the Annuals that have been injured by the late frosts had better be cleared away, and if the ground between the plants can be stirred up on a dry day with a small hoe it will do them good. Wall-flowers, Sweet Williams, Hollyhocks, and any of the more hardy biennials, may be removed to the flower-borders. Wall-flowers, if for their fragrance only, should be planted abundantly in all gardens.

Pits and Frames.—Where there is the advantage of a little heat a sowing of Ten-week and Intermediate Stocks may be got in; and if strong plants of Clintonia, Brachycome, &c., &c., are required for bedding out, they also may be sown. Should wet weather put a stop to out-door work, the most forward of the Verbenas, &c. in stock-pots may be potted off. Give them a little heat afterwards until they make fresh roots.—*W. P. A.*

III.—FLORISTS' FLOWERS.

Auriculas will sometimes, at this season, show a truss of flowers (as remarked of the Polyanthus last week), which, of course, must be taken off. Should it happen to be what is termed "a heart bloom," some danger of losing the plant (in consequence of the stem decaying and rotting the centre), may take place, unless it is removed in a proper manner. The best way is merely to pluck off the pips without injuring the stem, by which means the danger is often avoided.

Polyanthuses.—Mice will often attack these plants at this time of the year, especially when in frames, and commit serious ravages by eating out the hearts, and it will require some vigilance on the part of the grower to prevent them. Snails and slugs are also great pests to both Auriculas and Polyanthuses. A little fresh bran, placed under a flat tile, raised at each corner by small pebbles, I find to be the best trap amongst the many recommended.

Ranunculus growers are beginning to be on the *qui vive*; the necessary additions to the best bed ought now to be made, by purchase or otherwise. The names of a few excellent varieties will be given next week. Raising these beautiful flowers from seed is much better understood now than formerly, (thanks to Messrs. Tyso, Lightbody, and others), many of the old varieties being eclipsed by superb sorts of their raising.

Carnations.—The purchase of these favourite flowers, if not already done, had better be deferred till planting time.

Tulips must still be sedulously cared for, on frosty nights, by covering as before alluded to. A lattice round the outside of the frame is a great protection, especially when they are farther advanced. Last season I was much delighted with a trellis of this description; it was covered with the best varieties of Chinese and Bourbon Roses, thus giving fresh interest to that part of the garden when the Tulips were out of bloom.

Pinks.—We may expect frost and snow, and where gardens are exposed to the intrusion of hares and rabbits, Pinks as well as Carnations stand but a poor chance when the ground is covered, as they will scratch away the snow to obtain access to them. A net made of tarred-twine will be found an effectual preventive, when stretched to short stakes round the beds.—*J. F. W.*

IV.—PINERIES, VINERIES, &c.

Pinery.—Where a regular supply of fruit is required, there will, about this time, be some of the plants in the fruiting-pit showing, and if the bottom-heat is obtained by hot-water tanks, these may be turned out of their pots and planted carefully in the tan over the tanks, with six or eight inches of soil all round the roots, and put well up about the collar of the plant. If this is carefully done, and the roots of the plants are healthy, the result will be finer fruit and stronger suckers. Do not yet increase the heat if you can avoid it. It sometimes is necessary to hasten the fruiting of some of the plants, but in this case, remove those most likely to fruit to another pit, if you can, rather than subject the whole to too high a temperature, for the present. Look frequently over the whole of the Pines in pots, to see that none are too dry from the heat of the pipes or flues.

Vinery.—Many will now be about to start their first house of Vines, and it should be well considered, before putting any heating material over the outside borders, whether a proper supply can be conveniently obtained to keep the heat regular. If not, be cautious to avoid laying on so much fermenting material at first as to cause much heat, and then to let it decline for want of fresh material. On the other hand, where a sufficient quantity is always at command, and the heat is kept regular, by frequent stirring and adding fresh dung as required, it will prove very beneficial to the Vines. If the material over the border can be kept dry it will be better. Where the Vines are showing fruit the shoots demand constant attention; let the leading ones grow until the desired length of rod is obtained: stop all others and tie the fruit bearing spurs down to the wires, right and left of the rafters, to keep the leaves from coming in contact with the glass. Leave only one bunch upon each spur. If the sorts are the Black Hamburgh, White Muscadine, or other hardy kinds, a temperature of 60° by night will be high enough, with a rise of 10° by day. During sunshine admit a small portion of air, when the thermometer reaches 86°, letting it rise to 87° or 90° before it is given.

Peach House.— It may be useful to many to know that applying the pollen to the stigma of the Peach-blossoms here, by means of a camel-hair pencil as recommended in the Calendar of a former Number, has succeeded perfectly, although out of twelve trees only three had the pollen good. Disbudding should commence when the trees are out of blossom, removing a few at intervals of three or four days. It is better not to make the shoots too naked at once. Leave those shoots situated at the bottom of last year's wood to keep the bearing-wood regular over the tree. Syringe freely in the morning and evening; and if green fly is observed upon the trees, or in the house on other plants, fumigate with tobacco.

Fig-House —A good way of treating Figs in pots is to place them in a row upon the floor of a Fig-house at work, or Vinery, and place leaves and tan round the pots in the form of a ridge. It will produce a mild heat, and keep the roots in a more uniform state, both with regard to moisture and heat, than if exposed to the atmosphere of the house.

Strawberries.—It often occurs, that in attempting to get a very early crop of Strawberries, they are subjected to too much heat, and kept too close, and failure is the consequence. They should be kept cool at first, and have plenty of air daily, except during frost or cutting winds. They should on no account be subjected to the same treatment with regard to heat and air as Vines and Peaches (as is often done) till after the fruit is set, when they will do well on the Vinery or Peach-house shelves.

Melons.—The plants for the early crop will, with some, be up; and when about 2 inches high should be potted off into 4 inch pots, one in a pot, and plunged in the bed in the frame near the glass. Sow a few more seeds, in case of failure. Keep up a sweet heat of about 70° in the bed by adding fresh linings, or if the heat is supplied by pipes or tanks, which is much better, 60° by night will do, with a rise of 5° to 10° by day. Of course those who have a Vinery at work, or a heated pit for any purpose, will raise their first Melon-plants in these, instead of making either a bed for them or heating the Melon-pit, till the plants are fit to turn out.—*G. F.*

V.—HARDY FRUIT AND KITCHEN GARDEN.

Gooseberries and Currants, if pruned, may now be washed over with a mixture of cowdung, clay, soot, and lime, mixed with water to the consistence of thick paint.

Plums and Cherries will be benefited by washing with a similar mixture, adding to it, if thought necessary, Tobacco-water and flowers of sulphur.

Planting of Fruit Trees, where it is not finished, should be deferred a month or six week longer; meantime prepare the ground for their reception. In this changeable weather, much care is requisite for forward vegetable crops.

Sea Kale and Rhubarb will be most economically obtained at this period by taking them up and planting them thickly in a slight hotbed. Fresh plants will be required every season.

Asparagus.—To keep up a succession, fresh beds will require to be started every three weeks. A temperature for the roots of 65° is most desirable. When fresh beds are made and there is danger of over-heating, it is advisable to have some rows of drain-tiles across the bed, by opening the ends of which the superabundant heat will escape. They will also be useful in diffusing the heat of a lining when necessary.

Radish and Horn Carrots —Slight hotbeds should be got ready for crops to succeed those now coming into use.

Mustard and Cress.—Sow these once a week in a little heat; the soil can scarcely be too dry. For all these purposes much fermenting material is necessary, but there is always a quantity of refuse from the Flower-garden as well as the Kitchen-garden, which instead of being taken to the rot heap, ought to be made available in the frame ground.

Mushrooms.—I am obliged by the statements of "J. C.," and a "Mushroom" It is, however, often very difficult to assign a reason for failures. "J. C." states, "that for some time past, a kind of fungus matter, having the precise appearance of a cob-web, spreads over the bed, and completely rots all the fruit it comes in contact with; and that changing of the soil and the site of the bed, has been attended with no benefit" Something similar happened here last season. I attributed it to damp, and having swept it clean off the bed, and introduced a stream of air, I saw no more of it. As "J. C.'s" beds are out of doors, open hurdles or Pea-sticks put on the beds before they are covered up might be of advantage, especially if on a mild day openings were made in the covering, so as to permit the air to circulate between the hurdles and the bed. As it is likely that "J. C." from being an extensive grower makes his own spawn, it would also be advisable to obtain good spawn from another place, to impregnate what he may make in future. A "Mushroom" states that his Mushrooms "appear above the soil, and then die off, turning brown, and that many small worms are in the soil." This failure will sometimes happen from these causes.—Watering the crop overhead and exposing them to a cold atmosphere; using exhausted old soil, or that which is stuffed with vegetable and animal matter, worms, &c., all which prevent the surface of the bed from being solid and smooth, keeping the surface of the bed damp, while it is very dry underneath; and perhaps chiefly from spawning the bed a considerable time before it is earthed up, by which means the spawn is apt to exhaust itself so much on the dung as to prevent it penetrating the soil in a vigorous state.—*R. F.*

VI.—ARBORICULTURE.

Old Woods.—In old woods seedling plants of timber-trees often spring up, but are destroyed for want of relieving, by being pressed down by snow, or by being smothered with Ferns or Briars; the overgrowth of other plants also renders them of comparatively little value. A person accustomed to such work would be beneficially employed in going through the woods at this season to relieve these from their oppressing neighbours; they might be raised and fastened upright by various simple contrivances, which I cannot at present point out. They should be kept to one leader. If there are two or more leading shoots of nearly equal strength, cut close off, or shorten the least promising one; also shorten some of the lower longest side-branches to about two or three feet from the stem, according to the size of the plant. Thousands of maiden plants might be preserved by this simple and cheap method. I have saved many a plant from destruction by these means; but be sure to reserve as many side branches as possible of a moderate size, till the plants have become *stocky* (strong) and able to support themselves.

Coppice.—Considerable benefit would ensue, and great increase of growth would be derived, by following the directions here, as in Old Woods, viz., by employing a person to go over the Coppice in the winter or spring months, if they have not been done in the summer. Select a proper number of the strongest and best shoots from the stools, seedling plants, or suckers, for future purposes, and shorten the strongest lateral or side-branches on them, or cut any of equal strength with the leader close off, but by no means divest them of the moderately weak laterals; nor need you cut out the weak ones, only prune off their heads to prevent them growing up to injure the reserved poles, rods, &c.

Young Plantations.—When thinning in groups or otherwise, as stated in the last No., and where a permanent undergrowth is desired, as a blind or for shelter, particularly in narrow belts or small plantations, instead of cutting clean out any that are required for the good of the permanent trees, I would only prune off the heads of some of the inferior kinds, cutting them off to a side branch or branches—say from the height of from three to five or six feet, particularly on the side of the plantation most exposed to the wind. Beech and Hornbeam may be so done as they retain their dead leaves in winter; Silver and Spruce Firs also are suitable for this purpose, but not the Scotch Fir, except on the outsides of the plantation. Hollies, if any, should be kept down in like manner, and Whins or Furze when young; afterwards the spade should be employed to destroy the Whins. By this method a permanent undergrowth may be secured for a long time. Where it is not designed for Coppice you need not stop to take the lower tier of branches off the permanent trees, as recommended by some, at regular intervals; *Nature* will do that as the trees get up; nor need you be afraid of exhaustion of nutriment to the roots, by having a superabundance of them; only give them *light* and *room* in moderate compass, with regularity of branches, and you may safely leave most kinds to Nature after a time.

Hedge-rows and Nursery Work.—There will not be space this week to say much under these heads, or I had intended to describe the means I use with success to preserve young Apple or other trees from the depredations of hares and rabbits. I must defer it to another time, and as the weather continues open they will not do much damage.—*W. B.*

State of the Weather near London for the week ending Jan. 18, 1844, as observed at the Horticultural Garden, Chiswick.

Thurs. 25	42.7	32.1	37.4	6	0.90	1	2	2	1	3	2	4	3
Fri. 26	44.0	33.2	38.6	6	0.34	1	4	1	2	1	7	1	1
Sat. 27	43.4	33.3	38.1	6	0.21	2	3	2	—	2	6	3	—

The highest temperature during the above period occurred on the 23rd, 1834—thermometer 58°; and the lowest on the 27th, 1837—thermometer 17°.

Notices to Correspondents.

COMMUNICATIONS from the following CORRESPONDENTS are in type, and are only waiting till room can be found for them:—*J. Paxton, T. Berry, J. Selsby, W. G., I. W. K., Vites, J. Snow, C., J. Wighton, G. Thompson, Bamboo, A. Dawson, A Practical Man, P. Mackenzie, Gr., W. Billington, G. Fleming.*

ASPHALTE ROOFING.—*E. S. L.*—We believe this to be a very good kind of temporary covering, and one that will with care last a long while.

BONES.—*A great small Gardener.*—There is no cheap machine that we know of for crushing bones. Your only way is to smash them with a sledge-hammer, and dig them into your border. We have not forgotten our promise about Figs, but it is not easy to find a good man.

BOOKS.—*W. B.*—Newman's "History of British Ferns" will possibly suit you.——*A Friend in the Brazils.*—Raddis's book on Brazilian Ferns may be had through the Italian booksellers. No other has been published. The other questions are beyond our limits.

BROCCOLI.—*W. M. R.*—"Showing flower" in the Calendar means when the plants begin to show their heads, and therefore your plants that are not likely to do this before April, cannot be safely removed in the way there directed.‡

CANKER IN FRUIT-TREES.—*Abdalmymus.*—Similar instances of Canker to that exhibited by the shoots of your Pear and Apple-trees are too frequently to be met with. It is the same disease both in the Apple and Pear-tree. Some varieties are more subject to it than others, and in some soils it is induced on almost every variety planted in such. Wood that is produced in cold wet seasons is apt to canker in succeeding years. If it be owing to the variety, this may be easily changed; if the soil be the cause, endeavours must be made to make it better. Lime will probably do good. Shoots produced in a bad summer should be well shortened in.‖

CONIFERÆ.—*A Nurseryman.*—Cones of the Deodar cannot be had in this country at all; they must be procured from the East Indies. So also, in general, must the cones of rare Pines be had from their native countries. The Deodar will take on the Larch; grafting must be performed while the wood is soft.

CONSERVATORIES.—*A Subscriber of* 1843.—A conservatory, properly so called, is a place in which plants are preserved during winter without being forced. In such a building the thermometer may fall as low as 36°; but it is better to keep it to 40° as a minimum, if possible. Even a few degrees of actual frost will not harm hard-wooded conservatory plants, but it is better to avoid the risk.

FORCED PEACHES.—*Inquirer* sends "a few defective blossoms of Peaches and Nectarines, of which he wishes to know the cause, and how to remedy it. The defect consists in a total or partial absence of the female part of fructification. The trees are in a favourable condition as respects strength of wood, which was well ripened. The fruit last season was ripe in June and July. The trees were attended to, by syringing, &c., but the sashes were not completely removed, though plenty of air was given. The border lies low, and cannot be raised, but was defended from wet early in the autumn. It is now defended from cold, and is in a favourable condition as respects moisture. The house is not favourably constructed, but though it requires more care after the crop is more forward, I do not think it could have any influence upon the blossom. The trees have been brought on very gently; the temperature ranging from 45° to 55° at night, according to the weather, and about 10° higher during the day. Some trees in the house have scarcely any defective blossoms, others are quite the reverse; the same treatment has been given to all. The oldest and most valuable tree is the worst, though the blossoms on it are so thin that the greater part of them would be required for a crop. The wood is in a good heavy condition." [We find all the blossoms sent us to be males—a very singular circumstance, for which we are unable to account. Can any of our physiological friends assist us?]

GARDEN WALLS.—*A Subscriber.*—We are not aware of any reason why a wall built in cement should not be as good as one constructed with mortar; especially if copper wire is used for fastening the branches.

HEATING.—*Anonymous.*—Hot-water is a much better heating material than hot air in flues. The cheapest boiler you could get would be the best, for all that are now manufactured are sufficiently good for so small a house as yours. If you use pipes employ those four inches in diameter. One row above the other will be enough, and the nearer the floor the better. But you will probably find it worth your while to use iron troughs instead of pipes. We never give prices; for them you must apply to the advertisers, of whom many are to be found in our columns.——*Inquirer.*—It appears that you have 270 feet of four-inch pipes, heated by one small saddle-backed boiler, placed 30 feet from your pits, and communicating with them by means of a main pipe buried in earth. If this is so, your enormous loss of heat and the impossibility of obtaining warmth, with even an expenditure of one ton and a half of coals per week, are accounted for. If the pipe that connects the boiler with the pits were carefully inclosed in a well-constructed tunnel, there would be no great loss of heat. But it is far better that the boiler should join the pits; even then 270 feet of four-inch pipe are more than a small saddle-backed boiler will heat. In all probability, both the boiler and its situation require changing. In such a case you will find the advice of a *skilful* architect by far the cheapest purchase you can make before beginning alterations.

HERALDIC GARDENING.—*J. D.*—It takes more time than we can possibly spare to answer questions relating to this subject; and moreover, answers are of little use in matters where much depends on climate, soil, and the means at a man's disposal. Nothing, in fact, is more difficult than to do well that which you are required to effect. If we understand you, no flowers will do except what are easily procured, easily propagated, totally hardy, dwarf, and capable of flowering in succession for some time. Your family shield is cut out in Grass, and must be constantly filled, spring, summer, and autumn. The device is 3 bars wavy gules, on a field or, with an escallop argent in the middle of each bar. The following may be kept dwarf by pegging and topping, or are so naturally; but they must be grown in pots, so that they may be planted when in bloom:—

[FOR THE FIELD OR.]

Spring.	*Summer.*	*Autumn.*
Yellow Crocus	Dbl. Yellow Wallflower	Œnothera macrocar.
Double Jonquil	Shby. Yel. Calceolaria	Shrubby Calceolaria
Adonis vernalis	Chryseis crocea	Chryseis
Alyssum saxatile	Yellow Heartsease	Sphenogyne speciosa

[FOR THE BAR GULES.]

Spring.	*Summer.*	*Autumn.*
Dbl. Red Hepatica	Verbenas	Verbenas
Red Anemone	Frogmore Geraniums	Geraniums
Red Hyacinth	Scarl. Ten-week Stock	Pentst. gentianoides.
Arabis rosea	Clarkia pulchella	Dwarf Fuchsias.

[FOR THE ESCALLOPS ARGENT.]

Spring.	*Summer.*	*Autumn.*
Snowdrops	White Candy Tuft	White Verbenas
White Hyacinths	White Clarkia	White Petunias
White Crocus	White Nemophila	White Œnotheras
Arabis grandiflora	The Queen Verbena	Oxeye Daisy

HOTBEDS.—*Suffolk.*—Small as your hotbed is we cannot advise you to heat it with hot water. You will have too much power for a very little work. It is hardly possible to get a boiler small enough not to be too powerful. It will be better to make up a good foundation, three feet high, of old roots and refuse wood, secured by four stout stakes at the angles, and to obtain your heat from hot dung and leaves mixed. For a larger pit your arrangements are good, except that two inches of water-way are not sufficient; four inches would be better.

INSECTS.—*W. W. E.*—The bodies on the Oak-leaves are Oak-spangles, described at p. 52, 1843. The other appearance on the branches of the Fir, produced by an Aphis, has also been mentioned at p. 505, 1843.——*An Inquirer's* Cocoons will produce in the spring a Sawfly called Tenthredo (Trichiosoma) Lucorum of Linnæus. *R.——Northumbriensis* having found specimens of an Aphis amongst the leaves of the Rosa fragrans, I conclude that is the insect which causes the curling of the leaves. If such be the case, fumigating with Tobacco will be the best remedy. *R.*——*L. J. V.*—The insect living in the Beans is a Bruchus, whose history is given in the *Gardeners' Chronicle*, Vol. iii. p. 198; but the specimens having been destroyed from not being protected in a quill, it is impossible to determine the species. We will attend to the suggestions respecting the House flies.—*R.*

LARCHES.—*Corresp.*—For a narrow belt, upon a chalky soil, Mr. Selby cannot recommend the Larch to J., as it is not calculated under such circumstances to repay him, either by its timber or its ornamental qualities. Beech, a few Oak, and Birch, are more likely to answer his expectations. These must be kept well thinned from an early period of their growth. If the belt is wanted for shelter, or as a screen, a thick undergrowth of Thorn, Birdcherry, Holly, Laurels, &c., should be put in at the same time with the Forest trees.

MACLURA AURANTIACA.—*J. W.*—This plant seldom blooms until it is very old. If it is growing vigorously, stopping the fore-shoots in spring, so as to encourage laterals, might possibly induce it to form flower-buds. It succeeds best in a rather poor soil, as where this is rich the plant becomes too luxuriant to bloom freely. Your plant of Camellia japonica, that was in a sickly state from being too long in a drawing-room, but upon being shifted has recovered and made healthy young shoots, is the result of the good treatment you have given it, and is only what might have been expected.‡

MILDNESS OF THE SEASON.—We thank our correspondents for their continued communications on this subject: but we think it hardly desirable to publish further details at present. Let us see what happens in February.

MYRTLES, &c.—*A Reader.*—We are not aware of an easier or better way of cleaning Myrtles and Oleanders of Brown-scale than by washing them with water and a sponge. Camellias may be plentifully supplied with water when they are coming into bloom, if the drainage is perfect: but too much water, as well as too little, will cause the buds to drop: an imperfect drainage is often the cause of the buds dropping. A remedy for the club in Cabbages is given at p. 825 of the vol. for 1843.‡

NAMES OF PLANTS.—*S. W.*—Your packet is addressed to the Post-office, Bishops Waltham, you having forgotten to give your address.——*A Young Gardener.*—1, Quercus Ilex; 2, Phillyrea latifolia; 3, Quercus Ballota; 4, Thuja orientalis; 5, Jasminum revolutum; 6, Rhamnus alaternus, gold-blotched; 7, Phillyrea obliqua.——*J. C. L.*—Hexadesmia fasciculata. The plants will be sent when the frosts are over.——*C. D.*—As far as we can guess from the drawings—1, Orobanche cærulea, 2, Lactuca saligna; 3, Azalea procumbens. You will find Koch's "Flora Germanica" an excellent book for European plants. If you cut out the news part of the *Chronicle* you will have the same quantity of matter left as has been hitherto furnished. It is hardly possible for the news-agents to fold it properly. *Everyone shou'd damp it and refold it himself*, when he will find that the pages are very carefully arranged for future binding.——*Orwell Park.*—Your Hippeastra are to all appearance hybrids, for which no recognised names have been given. 1 is nearly the pure pulverulentum; 2 is probably a cross between that species and reticulatum or Johnsoni.——*Wyeside.*—Clavaria muscoides, Hypnum proliferum, Marchantia polymorpha.‖——*Philanthus.*—Borrera ciliaris.§——*A Lady.*—Elymus arenarius.——*E. R.*—Camellia maliflora.

OAKS.—*Acacia.*—It was the Quercus sessiliflora, advertised by Mr. Rogers, of Southampton, that we recommended; at least, we imagine that to be what you are inquiring for.

PASSION-FLOWERS.—*J. C.*—The hardiest Passion-flowers are the following—Passiflora cærulea, Colvilli, Mayana, and incarnata—but they are apt to get injured if planted in the open air, even in tolerably mild winters, and particularly if the situation is not a very dry one. They strike readily from the slenderer shoots after Midsummer, if the wood is a little hard. The cuttings should be put into white sand, covered with a bell-glass, and placed where there is a good bottom-heat (either in a dung frame or hot-water pit). When struck they should be potted singly into small pots, and returned for a few days to the frame or pit; afterwards harden them off by degrees.¶

PAYMENT OF RENT.—NOTICE TO QUIT.—*G. W. T.*—If the premises were let at the rent of 10*l.* a year, and no mention was made as to when the rent should be paid, the landlord cannot demand any part of it till the end of the year. If the tenancy commenced at Midsummer the notice to quit must expire at that time of the year, in the absence of any express stipulation to the contrary, and the notice to quit in March is invalid.

PELARGONIUMS.—*J. R.*—Two or three of the flowers in your list we have not seen; but the four first put down, although not answering completely to the qualities mentioned, will please, from their novelty and goodness.*

PICOTEES.—*J. C.*—There is no particular names for the hardy border Picotees. They are generally raised from seed, and any florist can furnish the old double kinds of border Carnations. One of the best is Cuthill's Nosegay, or Prince Albert.¶

TEMPERATURE.—*S. A. S.*—The thermometers made by Mr. Newman for registering the temperature in the Horticultural Society's Garden at Chiswick are quite correct. There is frequently as much as 10° difference between the minimum as observed in London and Chiswick at night. On the night of the 2nd, or morning of the 3rd inst., to which you particularly allude, the temperature indicated by thermometers in the Society's Garden and by others in Chiswick was 14°; at Rochester, 18°; at Thwaite, Suffolk, 24°; Walworth, 19°; Brighton, 26°; and at Uckfield, Sussex, 11°; whilst with you, in London, it was 29°.‡

MISCELLANEOUS.—*Iris.*—We are sorry we cannot help you to get lamp-oil out of paper.——*Priapus.*—The price of flower-pots varies with the makers and local circumstances—as, for example, the distance they have to be carted.——*A Constant Reader's* request is unreasonable. We cannot fill our columns continually with lists of plants which it is desirable to buy. Many such lists have already been given in former Numbers which can be consulted.——*Didymus.*—We always print the Proceedings of the Bot. Society when they are sent us by the Secretary. We cannot obtain them through any other channel.——*O. P. I.*—You may fill your Melon and Cucumber pit up over the flues with rough gravel or brickbats until within two feet of the glass. Over this it will be necessary to put a layer of turf, in order to prevent the soil from getting down among the bricks; this material will answer the purpose better than rough dung, which you are anxious to save, as the dung creates an impure atmosphere, which is apt to injure the plants at this season, when very little fresh air can be admitted. The temperature of the pit may be kept at from 65° to 70°; the front and back part over the flue should be watered, to keep up a moist atmosphere. Spanish Broom may be increased either from seeds or by layers. Your Cacti in a greenhouse should be kept dry until they begin to show their blossom-buds, when water may be more liberally supplied. In order to have them in flower by the end of March or the beginning of April, they should be removed early in February to some place where they would have a higher temperature than that of a greenhouse. If your Vines are weak they may be cut down to three eyes; but if strong, leave six or seven, and allow the top shoot to run up the rafters. If the weather keep mild your Verbenas may possibly survive the winter in a bed in the flower-garden; they must be closely covered up in frosty weather, with Spruce branches or some other protecting material. The usual way is to strike cuttings of these in autumn, and keep them in a pit or on a shelf in the greenhouse till spring. We have answered these questions, but we cannot be supposed to instruct persons so entirely ignorant of the rudiments of their business.‡——*W. D.* will find directions for making charcoal given in detail at 478, vol. 1843.‡——*Allamgate.*—You may now prune any of the evergreens you have removed, except common Laurels.——*Mr. Hunter.*—Thanks for your suggestion, to which, however, there is a practical difficulty.——Thanks also to *Mr. Durant*, for the same suggestion.——*A Seedsman.*—It will take time to obviate the inconsistency.

*** As usual many communications have been received too late for answering this week.

PROFESSOR LOW'S NEW WORK.
Immediately will be Published, in 8vo.,
AN INQUIRY into the NATURE of the SIMPLE BODIES of CHEMISTRY. BY DAVID LOW, Esq., F.R.S.E. Professor of Agriculture in the University of Edinburgh.
Also, by Professor Low,
ELEMENTS of PRACTICAL AGRICULTURE. Fourth Edition, greatly improved, with 200 Woodcuts, 21s. cloth.
THE BREEDS of the BRITISH DOMESTICATED ANIMALS. 1 vols. 8vo. with 56 coloured Plates, 16l. 16s.
London: LONGMAN, BROWN, GREEN, and LONGMANS.

The Agricultural Gazette.

SATURDAY, JANUARY 20, 1844.

MEETINGS FOR THE TWO FOLLOWING WEEKS.

Thursday, Jan. 25 } Agric. Imp. Society of Ireland . 2 P.M.
Thursday, Feb. 1 }

THE question, What is the PROPER SEED-TIME FOR WHEAT? is one which every district must answer for itself. It is only by experience that the habits of our cultivated plants can be ascertained; and this experience, in reference to Wheat, will doubtless vary with the climate and soil on which it is to be grown. On early soils in high-land districts, an earlier seed-time is required than where the soil is early and the climate mild.

An experienced farmer of our acquaintance informs us, and our own experience for the last three or four years bears him out in the assertion, that in the mid-land counties of England, where the soil is dry, it is immaterial with many kinds of Wheat at what period between October and February they are sown. The productiveness, however, of some of the old varieties, which have received one unvarying treatment from time immemorial, would probably suffer were this treatment to be rudely altered. The habits of an autumn-sown variety, such as the Red Lammas for instance, which has hardly ever been sown in spring, must have grown upon it so perfectly, that any abrupt attempt to act in opposition to them would probably prove injurious. But there are some kinds which we have sown indiscriminately, at any time during the period alluded to, and even so late as the month of March, with results evidently unaffected by the variableness of this treatment. We have had from the Hopetoun Wheat, and from a sort named, on account of its peculiarity, the Red-straw White Wheat, a produce per acre from seed sown during every month in winter and spring, varying, from four to six quarters, altogether independently of the time when it was planted.

The proper time for sowing Wheat is thus the subject of a purely practical question, and we are not aware of any doctrine of vegetable physiologists which can assist in its solution. A preference is, however, given by the gentleman to whom we have alluded above, to one period in the season of Wheat sowing, as being the proper seed-time for all varieties, and he gives a very curious reason for his opinion. The period referred to lasts during the few weeks immediately preceding the frosts of winter, and thus, of course, his opinion can only apply to land which is naturally or artificially dry. He considers it right that the Wheat-plant should not appear above ground before winter, but that the seed should be placed in such a position as will enable it to take immediate advantage of the earliest signs of approaching spring. He grounds this opinion, we know not with what justice, upon the analogy existing between plants and animals; knowing well, that if in feeding a bullock the farmer allows its progress to be checked by negligence, or any other cause, he will suffer not only by the loss of all the food necessary to bring it up to the mark again, but also by the diminished aptitude of the animal to fatten, he considers that the early-sown and forward Wheat-plant, when checked by the frost of winter, not only has the organs injured by which it gathers food from air and soil, but that its capability also is diminished of remedying this injury by a future vigorous growth. Whether this idea be corroborated by the doctrines of vegetable physiologists or not, it is one which deserves our attention, for it is the result of a lengthened experience.

IN one of his Lectures lately delivered before the English Agricultural Society, Professor Brande informed us that the efficiency of manures is often owing to certain mineral matters, contained in them only in minute quantities. Considering the expenses of carting, &c. which attend the use of our bulky manures, it is worth our while inquiring into this statement, for it is certainly one the truth of which is desirable.

The *conclusiveness* of an argument often depends upon the preconceptions of the persons to whom it is addressed; and we must therefore first attempt to show that, however contrary the above statement may be to notions which have grown out of dealing with manure by the cart-load, it is one which analogy proves to be probable. In other arts, it has been found that the usefulness of means which accident, perhaps, first discovered, frequently depends on the existence in them of principles which are there enveloped in a great mass of useless matter. Thus, in Medicine, the properties of burnt sponge, as the cure for a goitred neck, are owing to the presence in it of minute quantities of a substance termed *iodine;* and the value of Peruvian Bark, as a cure for the ague, depends on the existence in it of a substance called *quinine*. These two medicines are obtainable cheaper from other sources, and are now administered in a pure form. Cases similar to these might be quoted from other professions, but these are selected because the analogy in other points which exists between the plant and the animal makes us more ready to anticipate a resemblance between them in those particulars also which relate to their food. Our case, then, stands thus:—bulky medicines used formerly to be advantageously administered, till science pointed out that their efficiency depended on the existence in them of vegetable or mineral substances in minute quantities—bulky manures are now administered to plants; why may we not expect that here also some of their apparently most insignificant ingredients may turn out to be the true sources of their value, and that, with the *iodine* and *quinine* quoted above, these may be obtained cheaper elsewhere, and applied in an unadulterated form?

It was a consideration of some such analogy, unassisted by the experience on this subject which has since accumulated, that, more than half a century ago, led Lord Kames, a Scottish landowner, to express his opinion that the time would come when the farmer would be able to carry to the field enough in his pockets wherewith to manure an acre of land. The doctrine implied in the apparently common-sense reply of his tenant, that in such a case the farmer would be able to carry the crop home on his back, now stands every chance of soon being refuted by ordinary experience.

But let us leave probabilities, and consider the facts upon which the truth of the above statement rests. To take two instances from among the many manures now employed, bones and soot have long been known as powerful fertilisers. It has been discovered that the efficiency of the latter is owing to the sulphate of ammonia which it contains; and this salt is now obtained more cheaply from other sources—gas-water, for instance. It is now sold as the *essence of soot*, and is used with great advantage in quantities less than 100 lbs. per acre. (See paper in our 1st Number by the Hon. and Rev. L. V. Harcourt). The value of the former as manure is believed to be owing to the existence in it of *phosphorus*, a very singular substance which is there united as phosphoric acid, with lime. It is not probable that this substance will ever be obtained in a cheaper form than that in which it is now used, for in those bones out of which all animal matters have been boiled, the phosphate of lime formed so large a proportion as 8-10ths of the whole; we hear, however, of the existence of this substance in large mineral beds in Spain and other countries, so that even this is not impossible. Some very curious experiments have lately been performed by the Duke of Richmond, which show the advantage of concentrating in the bones that valuable ingredient in them to which we have referred; at the close of Prof. Brande's lecture Mr. Pusey stated their results, and at the same time said that this was the first case in which Science had been of direct benefit to Agriculture.

When all soluble matter is dissolved out of bones the matter left consists almost entirely of phosphate of lime. It was known that by adding to this substance about ¾ of its weight of *diluted* sulphuric acid, or oil of vitriol, the lime contained in one half of it would be deprived of the phosphoric acid with which it was previously in union, and, uniting with the sulphuric acid, would form sulphate of lime or gypsum, while that contained in the other half still combined with its ordinary portion of phosphoric acid, would, in addition, unite with that from which the first half had just been parted, and form a super-phosphate of lime. Thus, putting out of sight the water with which in order the more readily to induce this chemical action the acid is diluted, while, at the beginning of the operation we had 20 lbs. of phosphate of lime, and nearly 5 lbs. of *dry* sulphuric acid: after its close we have 17 lbs. of super-phosphate of lime, and 8 lbs. of gypsum. Now, independently of the acknowledged value as a manure of the gypsum which is obtained by this process, the phosphorus in the super-phosphate of lime is in a condition much more likely to be available for the use of plants than it was before; for, whereas it was previously insoluble, it is now easily dissolved in water, and is thus capable of absorption by the roots of plants. Taking all this into consideration it was resolved to ascertain whether in the practice of the farm this chemical theory would prove capable of beneficial application. The result of the experiments that were instituted was such as had been expected; after taking all the expenses of the process into the account, the Duke of Richmond obtained in Morayshire, by the application of a *less value* of bones thus treated, a greater crop of Turnips than that yielded by the same extent of land which had been manured with bones in the ordinary way. His Grace's experience on this subject is recorded in the present Part of the English Agricultural Society's Journal.

We have received from Mr. Lawes of St. Alban's the results of a great variety of experiments with manures, which as occasion offers, we shall present to our readers. Among them are a series upon the subject under consideration.

The following Table represents the results in tons and cwts. of Turnips per acre, from the application of bones in various quantities per acre, which had been previously mixed in various proportions with sulphuric acid. These figures are calculated from the actual quantities, the experiments having been conducted on plots of land each one-fiftieth of an acre in extent. The quality or condition of the soil cannot have been good, or the result would have been greater throughout, and especially on those parts to which no manure was applied.

PER ACRE.

Weight of bones applied.	Result without sulph. acid.	Result with 1-fifth their weight of sulph. acid.	Result with 1-third their weight of sulph. acid.	Result with 1-half their weight of sulph. acid.	Result with 3-fifths their weight of sulph. acid.	Result with 4-fifths their weight of sulph. acid.
lbs.	ton.cwt.	ton.cwt.	ton.cwt.	ton.cwt.	ton.cwt.	ton.cwt.
100	8 0½	10 14	9 17	10 7	7 14	11 4
200	8 9	9 17	12 9	10 18	11 14	14 3
400	11 7	14 2	14 0	13 18	15 3	16 7
800	9 7	13 13	10 17	17 9	12 18	18 12
Nothing	3 15	5 11	5 11	4 7	4 7	4 7

Notwithstanding the irregular action of this manure in the instances, recorded in this Table, it may be inferred, we think, that the fertilising influence of bones is greatly increased by subjecting them to the action of sulphuric acid: thus, 100 lbs. of bones, previously acted upon by one-fifth their weight of sulphuric acid, produced a better crop of Turnips than 800 lbs. of bones applied in their ordinary state.

The solubility of the super-phosphate of lime will probably give it a great advantage over bones on stiff soils. On such land bones have not been found to act beneficially, while on light soils they are a powerful manure; and the reason probably is, that the latter admit of the rapid action of weather and other external agents on substances imbedded in them, while in the former such substances are wrapped up in a more impervious covering. Bones in clayey soils thus suffer a very slow decomposition, and it is with great difficulty that the phosphorus, or rather the phosphoric acid which they contain, acquires solubility in water.

But we have been led into a digression. Guano is another of the manures, the distinguishing ingredients of which may be obtained more cheaply elsewhere. A mixture of these may thus be formed unadulterated by the useless sand and earth which the natural manure contains in considerable quantity, and an artificial guano, thus made, is to be had in the market, the value of which, at all events equal to that of Peruvian guano, is attested by numerous experiments.

The component parts of these artificial manures are all to be found in small quantities in ordinary farm-yard dung; and, putting out of sight the advantage of applying a large bulk of manure to the land as respects its influence on the texture of the soil, there can be no doubt that, including salts of ammonia which have an organic origin, it is to these mineral ingredients that its value is owing. This will appear from a consideration of the causes to which the difference is owing that exists between poor and rich farm-yard manure. The quantity of vegetable matter in both cases is the same; but in the one instance the cattle have been fed only on straw and Turnips; while in the other, they have received oil-cake, or, it may be, meal, or grain; all of these, as proved by chemical analysis, being greatly superior to Turnips or straw in the quality of their mineral ingredients, which pass into the manure-heap through the animals feeding on them, without much diminution in quantity. We do not wish that these remarks should imply that it will ever be more economical in districts unaffected by the neighbourhood of towns, constantly to depend for supplies of manure on external sources rather than on that which is produced by the consumption on the farm of the produce of the land. We believe that this is the cheapest way in which fertility can be maintained unimpaired, and that the art of cultivation has attained perfection in one of its branches, only where, as is possible on most, if not on all soils, the farmer keeps his land in good condition without ever fetching fertilizers from beyond its limits.

All that we wish to infer is well expressed in a statement by Mr. Vivian at a late meeting of the Swansea Farmers' Club, where he expressed his opinion, that the great advantage arising from the various artificial manures depended on their portability, which rendered their application easy and

profitable on farms that were difficult of access, and where the land had been completely worn out.

ON THE AGRICULTURAL VALUE OF LAND.

It is the quantity and value of its free produce which determines the value of land. We have nothing, however, to do with the latter of these particulars, for those circumstances which affect the demand for, and the price of, Agricultural produce have evidently no connection with facts affecting the amount which the soil is capable of yielding. When speaking, therefore, of the value of land, the quantity and quality only of the free produce it yields is referred to. Free produce is that which remains after the expense of producing has been deducted from the gross produce. The weight of crop which soil of any description is capable of yielding depends upon its capability of supplying food and nourishment in a manner and quantity suited to the nature of the plant cultivated. The degree in which it possesses this property is due, partly to its mineral composition, and partly to the nature and quantity of the animal and vegetable matters it contains; the former being the vehicle of nourishment to the plant, and the latter, together with some of the mineral ingredients, also constituting the nourishment supplied. Now, since the great majority of soils are owing to the disintegration of the rocks on which they rest, that portion of the value of land which depends on the mineral composition of the soil must be due to, and will vary with, the geological character of the district; and since the amount of animal and vegetable matter contained in the soil is chiefly owing to the cultivation it may have received from the farmer, that portion of the value which depends on the quantity of these matters which the soil contains must be due to, and will vary with, the treatment it has received.

Besides these, however, the effects of climate—a third and important item in the account—are to be considered; a difference in climate will make all the difference between a soil of the greatest, and one of the least value, in two cases which are otherwise under precisely similar circumstances; and as a difference in elevation produces such great changes in the climate of even a moderately extensive district, it is of importance, in the valuation of land, to know accurately its level above that of the sea.

If, however, for the present, we put this out of consideration, the value of land may be said to depend on two things—the nature of the rock on which it lies, and the treatment it has received from the farmer. Were it otherwise, and did the value of land depend wholly on its mineral composition, as due to the rock on which it lies, then a geological map of any district, and one on which the extent of the various descriptions of soil occurring in that district were laid down and defined, would consist of exactly the same divisions of the country, and in crossing the line dividing one geological formation from another, we should just be stepping from land of one kind and value, on to land of another kind and value. This, however, is not the case; but it is evident that it will be the more nearly true in the proportion in which land is in its natural state, for the less cultivated any district may be, the less will the value of its land be owing to any treatment good or bad which it may have received, and the more entirely will it be dependent on its mineral composition. In instituting a comparison, therefore, with respect to fertility, between the soils of any two geological formations, it would be incorrect to fix on highly cultivated spots, which owe their value chiefly to the good treatment of the farmer. Commons and waste land, on the contrary, are to be considered as affording almost the only true index of the unassisted fertility of any geological formation.

I.—The value of land depends in a great measure on its mineral composition.

All the mechanical properties of a soil are due to its mineral composition. It is heavy or light, and thus adapted for the growth of one plant or another, according to the prevalence in it of this or that earth. The mechanical properties of a soil are of the greatest importance. The slightest variations in them produce great differences, not only in the value and amount of the crop yielded, but also in the expense and difficulty of cultivation. The greatest care ought, therefore, to be taken to improve their properties. This can be *permanently* effected in two ways. The first of these is by drainage.

If the subsoil consist of sandy and clayey beds alternating with one another, the soil lying on it will be full of springs; if it consist merely of clay, the water falling on it cannot sink, but remains on the surface, where as long as it remains it renders every attempt at cultivation injurious instead of beneficial. In both of these cases the injury done to the land is of two kinds. In the first place, as long as a soil is wet, any treading which it undergoes in cultivation has the effect of kneading it into a mortar, which, on drying, becomes so hard that it will not allow the roots of plants to pierce it. The consequence is that the plant cultivated or the seed sown, after being half drowned or perished in the water, is withered in the sun. In the second place, as long as the soil is wet, the water, filling all the pores of the soil, hinders the admission of air, without which the decomposition of manure in the soil, necessary to the life of the plant, cannot proceed. These two modes, in which land is injured by stagnant water, render any means of depriving it of this water doubly valuable, and hence the immense improvements effected by drainage, especially when assisted by the subsoil plough.—*M. S.*

(*To be continued.*)

AGRICULTURE OF THE ISLE OF MAN.—No. 1.

[The subjoined sketch of Manx Agriculture is contributed in the hope that some industrious young farmers of moderate capital may be induced by it to visit the island; and that, finding their ideas of Colonial emigration a little anticipated, they may be induced to settle there, and enjoy near home, freedom from taxes, poor's rates, and turnpikes, without incurring the hazard of a long voyage in search of it, to uncleared woods, unwatered pastures, and fickle if not sickly climates.]

As might be expected from its geographical and insular position the climate of this island is humid and variable, the extremes of heat and cold are little felt, so that neither is the progress of the plough much impeded by frost, nor the harvest materially injured by parching drought. To the practical farmer it will be hardly necessary to explain that on this account although the "course" of cultivation comprises the regular rotation of green crop and grain crop (of all kinds) yet Nature favours the former rather than the latter, and it is to the perseverance and industry which the Manx farmer bestows on his green crop, that he is indebted, under Providence, to the moderate and varying success which attends his grain harvest.

The island is divided into 17 parishes, all of which touch upon the sea, with the exception of the inland parish of Kirk-Maroun. The regular and, though speculative, yet at times remunerative employment of the Manx fisheries (the most prolific perhaps in the British seas) has for centuries drawn away the lower-born islander from the quiet pursuits of the farm, and that, too, at a time when his attention is the most required—in the hay and corn harvests. The most important operations are therefore confided to the female members of the family (for every father and father's son able to haul a rope or trail a net must needs go a-fishing) and right trustily do the Manx women fulfil their delegated trust; nowhere can be found women of more enduring industry. It may be safely averred that without the hearty and cheerful assistance of the Manx women Potatoes could not be planted nor the grain harvested, although, without doubt, herrings would be caught, and bloaters dried to perfection. It is, indeed, hardly matter of surprise that, with a varying climate, an ill-drained soil, with capital deficient, and energy not superabundant, while as stated in the clause introduced by Bishop Wilson into the Manx Litany, "the blessings of the sea are restored and continued to them" so abundantly, the islanders should prefer the less laborious and more stirring avocations of the ocean, to the steady returns of field-labour. At present, however, a brighter era appears to dawn over the interests of Agriculture in the Isle of Man, and this may be attributed to many causes. Wholesome and necessary laws have rendered the once splendid pursuit of the smuggler profitless and too perilous. The fisheries have been intruded upon by strangers, and the example set by wealthy Manxmen and resident strangers has excited profitable emulation; added to these the adjacent markets of Liverpool and Whitehaven have opened channels for the exportation of produce, and thus increased attention has been directed to the means of raising it, so that Mona promises soon to occupy a prominent place in the statistics of British Agriculture.—*Cultor.*

(*To be continued.*)

AGRICULTURAL EXPERIMENTS.

(*Concluded from p.* 26.)

Let me now solicit your attention for a short time to another experiment not unworthy the farmer's notice. I had seen a statement in the "Farmers' Magazine" that tailing Wheat, or Chickenscraps, as the farmers call them, because they are considered fit for nothing but to be food for chickens—being, in fact, the refuse of the Corn, will yet produce as good a crop as the heaviest, fullest seed. This seemed to me the strangest of all paradoxes, and I utterly disbelieved it; but yet I resolved to make the trial, because if it proved as I expected, to be false, it was desirable to undeceive the farmers, who might be deluded by it into the loss of their crops; on the other hand, if it turned out to be true, it would be a fact of vast importance to the country, from the immense saving of bread-corn which would accrue from the adoption of the system. Accordingly a small plot of garden-ground was sown, one half with good Wheat and the other half with tailing or refuse Wheat. Upon my return home after an absence of some weeks in the spring, I was surprised to see the latter covering the ground as thick as Grass in a meadow, but I found upon inquiry that the person who had the charge of the experiment considering the seed good for nothing, and quite despairing of its growth, had sown five or six times as much of it as of the other. As this quite thwarted my design of comparing the produce of both, I directed that half the thick-sown Corn should be hoed out, till the plants were reduced, as nearly as possible, to the same number as occupied a corresponding portion of the good-seed ground. The other half was left to take its chance, except that one row which happened to be above a drain, and consequently in very shallow soil, had the benefit of a watering with sulphate of ammonia. At harvest the first 12 plants in one row of each sort were taken as a sample, and the produce weighed—

	Grains.	Average of Ears per Plant.
I.—12 Plants of good Corn gave in weight	926	6·6
II.—12 do. of tailing Wheat left thick	351	3·8
III.—12 do. over drain, watered with S. A.	433	4·1
IV.—12 do. thinned out to the same number as No. I.	1133·7	7·8

Upon these experiments I would first remark, that sulphate of ammonia maintains its character of utility by making more than amends for the inferiority of the soil; in the next place, they demonstrate very strikingly the impolicy of sowing Corn too thick where ears are wanted and not herbage. The plants, where too thick, choak each other, and are too feeble to form their seed, as every Horticulturist knows. But are we to conclude from the fourth experiment that tailing Wheat is better for seed than that which is plump and heavy? Certainly not. Its superiority can only be attributed to the loosening of the soil by the hoe, and opening it to the fertilising influence of the atmosphere. This strongly recommends, however, the use of the hoe on Wheat in spring; and surely it is a great point gained in agriculture, if it can be proved that the worst seed may be made more productive than the best, if it only has the advantage of superior cultivation.

Before I conclude, I wish to mention the comparative productiveness of four different sorts of Wheat, ascertained on the same scale and in the same way:—

	Grains.	Average of Stalks per Plant.
I.—12 Plants of White Straw Wheat, gave	916	196
II.—12 do. of Old-fashioned White do.	1052	33
III.—12 do. of Australian Prize do.	1334	49
IV.—12 do. of do., second quality do.	2424	272

All these were sown in the autumn, and grew nearly a foot higher than the others which were sown in the spring. Of the first two, which are the common Wheats of the country, and are distinguished by the names they usually bear, it may be observed that the number of their ears is double that of the spring crops; but the weight of the grain they produced is very little more, indeed hardly so much as that from the hoed Wheat; but this is partly to be accounted for by their greater forwardness in ripening, which exposed them more to the depredations of the birds, in spite of all the care that could be taken to protect them; and also partly by their having more small ears of a second growth, which had neither strength nor time to mature their seed. Perhaps in the spring Corn this disposition to late tillering was checked by the use of the hoe. The South Australian Wheat (No. IV.) laboured under greater disadvantages than its English brethren; for it formed its ears seven inches long, a fortnight before any other, and promised to be a finer specimen than any this country can show; but unfortunately it was attacked by the red-gum—a disease well named from the clammy exudation which discolours the ear. The insect which causes it was probably in this instance imported from Australia, for no other Corn was affected by it. If any means can be devised, as I hope they may, to get rid of this pest, the country will be under great obligations to its colony for impressing such a character of fertility upon our Wheat; and if it be true that within certain limits change of soil and climate is beneficial to the growth of plants, no change can be more complete than by fetching our seed from the antipodes.—*L. Vernon Harcourt.*

ON MINERAL & INORGANIC MANURES.—No. III.

BY PROFESSOR CHARLES SPRENGEL.

(*Translated from the German.*)

Having said thus much of mineral manures in their general bearing, I shall now discuss them separately, and at the same time enumerate their chemical ingredients. It is only by so doing that the way in which they act can be properly described.

1. *Lime.*—Lime, which has now been long used in Agriculture, ranks amongst the most useful of mineral manures although sore mistakes are at times committed in its application. Lime suitable for manure occurs in nature in various states of purity, and also different as to its external qualities; those most used are the varieties which Mineralogists call common compact limestone, shell limestone, roestone or oolite, stinkstone, and chalk. On the seacoast, burnt shells are very much used as manure, which also consist chiefly of calcareous earth.

In its pure state, lime consists of 56.4 calcareous earth and 43.6 carbonic acid; but in this proportion it is only found in calc-spar (crystallised carbonate of lime) and in some sorts of marble (crystalline granular limestone). Those sorts of lime used for manure contain, besides carbonate of lime, more or less of silica, alumina, oxide of iron and manganese, common salt, magnesia, phosphate of lime, and some other admixtures, which amount at times to 8 or 10 per cent. of the whole. These extraneous admixtures partially explain the very different effects which lime manure will produce. That lime, for instance, which contains much phosphate of lime, will always act more powerfully than that which contains none, for phosphoric acid is an essential ingredient in the food of plants.

Lime is generally burnt before it is used, and thus the whole of the carbonic acid is expelled as gas. When exposed to the air after this, or sprinkled over with water, it becomes converted into an extremely fine powder (it becomes slaked), by which it is made capable of mixing more intimately with the furrow-slice. Quicklime will fix 24½ per cent. water chemically, but will lose it again in the same proportion, as it attracts carbonic acid from the air. By losing its carbonic acid after burning, it becomes caustic, *i. e.*, it will now affect organic matter with which it may come in contact, decomposing it, and combining chemically with the substances thus generated. By the action of quicklime, organic matter is converted chiefly into humic acid. To this, lime bears a strong affinity, and if previously combined with water, it will lose it again through the above combination; the new compound, however, will again combine with water.

In its caustic state, lime is soluble in water, but 752 lbs. of water at a temperature of 168 deg. Fahr. are required to dissolve 1 lb. of calcareous earth. The lime-water thus formed possesses alkaline properties, and so also does the earth itself. It is easily soluble in water, if free from carbonic acid, and to this its action on the organic matter of the soil is owing. In order that substances may act upon each other, one at least must be in a liquid state; and this explains why caustic lime dissolved in water will injure vegetation.

As long as burnt lime remains caustic, it acts on the

ver in the following manner: it decomposes the vegetable matter and the coal of humus, which, there can be little doubt, is contained in all soils; by this operation humic acid is formed, and the mineral substances contained in the vegetable matter, such as potash, soda, alumina, nitrogen, magnesia, lime, &c., are disengaged from their former chemical state of composition. It creates, therefore, as it were, vegetable nourishment, for neither coal of humus nor vegetable matter are soluble in water. With the humic acid thus generated, it combines into humate of lime; but as this substance is soluble in water only with great difficulty, the plants will not be able to take up more than the amount of lime they absolutely need. On account of its affinity to humic acid, lime will also unite with that contained in the soil in a free state, which will thus be rendered nearly insoluble, and this is exactly the contrary of what was formerly believed to be the case. Lime also frees the humic acid of the soil from the alumina, which may be found chemically combined with it, and thus also humate of lime is generated, which affords more nourishment to plants, as humate of alumina is quite insoluble in water. For this purpose, however, a greater quantity of caustic lime will be always required, and thus clayey soils must receive a greater quantity of lime than other sorts of soil, as they generally contain much humate of alumina. Lime, also, most probably decomposes the silicates of potash and soda contained in the soil, combining chemically with the silica and driving off the potash and soda, which then unite again with humic or some other acid. It further enters into combination with the hydrated silica contained in the soil, forming a silicate of lime insoluble in water; and this is beneficial, as crops (especially the Cerealia) might easily obtain through the hydrate too much silica, which would make them difficult of digestion. By this process, however, the plants are at any rate deprived of some part of the silica which they would otherwise take up. If the soil contains much hydrated silica, the plants will not receive a sufficient quantity of lime, for it will all be employed in decomposing this compound and forming another which, as already said, is insoluble in water; manuring with lime thus often needs to be repeated several times. It is a very important fact, moreover, that lime disposes the protoxide of iron and manganese to attract oxygen from the air, and thus to be converted into oxides, in which latter state they will be useful to the crops, whilst in the former they are often detrimental. We shall find, therefore, that manuring with lime will be especially useful to ferruginous soils.

Hard clayey soils will be much loosened by a strong manuring with lime; in fact they will attain quite another texture, and this is caused by the different extent to which the two earths are distended by the absorption of water. This will be shown more clearly when treating of marl. Most probably lime also disposes the oxygen and nitrogen of the air to form nitric acid, by which nitrate of lime is formed, which is a very powerful manure. In fine, during all the decompositions and combinations which lime undergoes, electricity is developed; and this also will certainly increase the activity of the soil. Caustic lime will also act beneficially in destroying many seeds of weeds, or rather it will cause that if they should germinate they will not come to perfection. It also kills many of the lower orders of insects and worms.

(To be continued.)

ON THE APPLICATION OF CHEMISTRY TO AGRICULTURE UPON RATIONAL PRINCIPLES.—No. II.

(Continued from page 27.)

Now the fertility of all soils depends upon the due proportion which they contain of the above principles. It is the object of Agricultural Chemistry to point out where any of them is deficient; and it is the object of the scientific farmer to remedy this deficiency, and to maintain the correct proportion of each by suitable and judicious applications in the form of manures.

To understand this, it is quite clear he must have some knowledge of the chemical constitution of manure as well as of plants. These subjects we shall consider hereafter.

It is also necessary that the farmer should have a standard by which the fertility of a soil, in its natural state, may be considered as a maximum in the due proportions of the above elements; and, secondly, that he should be able, by a simple process, to ascertain these proportions for himself.

Now, with regard to a standard of fertility, I confess we shall have some preliminary difficulty, because it can only be decided by experiments, and of these we have not at present sufficient to form positive conclusions. But if the point be once conceded as important, it will be soon established; for if truth is the object of experiment, I cannot for a moment doubt we shall have many volunteers in her service. All, however, that I consider necessary at present can easily be accomplished.

I propose that a "standard of fertility," which will also be a "standard of quality" of soils, should for the present be founded upon the proportions of "fine sand" and "impalpable matter."

It is the impalpable matter that gives the quality of heaviness or lightness to soils; and it will be easily observed, by glancing at the general analysis detailed above, that it contains the principal inorganic and fertilising ingredients in all soils.

While, then, we only commence our standard founded upon this well-known general division of a soil, we must hope, as Agricultural Chemistry progresses and experiments are multiplied, to carry our investigations further, and found a perfect standard upon a perfect series of analyses.

In all soils there is a variable amount of moisture, which can only be driven off by heat. This property of retaining moisture is greatest in heavy soils, or those in which there is the largest portion of impalpable matter; and the least in light soils, where that proportion is less. Here, then, we have our starting-point dependent upon our standard of fertility; for it is not necessary for me to allude to the important bearing of this quality of soils to its fertility.

In heavy soils, the amount of insensible moisture may be fixed as a maximum at one-eighth of the entire soil; the loose gravel and undecomposed vegetable fibre at one-eighth more.

Thus, if we take 400 grains, we shall have as a maximum in heavy soils 50 grains of moisture, and 50 grains of loose gravel and undecomposed vegetable fibre. It will seldom exceed this proportion, but will frequently be below it. We shall now have 300 grains, which are divisible by a very simple process into two portions, a fine sand and an impalpable powder. The question is now to decide what are the proportions of these two substances—for this will fix the character of the soil. In a heavy tenacious soil which I recently examined, the result was 108 grains of impalpable powder, 187 of fine sand, 54 grains of coarse gravel, 35 grains of moisture, and the rest vegetable and animal matter and loss. This soil the farmer told me would grow good crops of Corn, if he could but "work it;" but the difficulty in doing this was such, that he considered it the worst field on his farm. Now it would not be sound to attempt to establish principles upon a single experiment, but as the result agrees very much with the observations of others, and has been, with little variation, confirmed by other experiments, I am induced to propose one part of impalpable matter in four of the entire soil, to be characteristic of a fair specimen of heavy soil; every five grains above this standard bringing it nearer to absolute clay, and every five grains below approximating it to the standard I propose to fix for,

Light Soils.—In an excellent light soil which I examined, and which will be further alluded to hereafter, I found the following proportions in 400 grains:—

Moisture	21	grains.
Loose gravel	27	,,
Fine sand	249	,,
Impalpable matter	78	,,
Loss	25	,,
	400	grains.

Sir H. Davy, in an excellent Wheat-soil, found three parts in five, fine sand. He does not state the proportion of impalpable matter, but assuming that one part was of moisture and coarse gravel, his analysis would be—

Moisture and coarse sand. Undecomposed fibre and loss	80
Fine sand	240
Impalpable matter	80
	400

Many good fertile light soils, particularly Turnip-lands, have a much less proportion of impalpable matter than stated here; but I think we may fairly take the proportions of 66 impalpable matter to 234 of fine sand, as a standard of a good light soil, being as one in six to the whole soil.

When the proportion is as low as one part of impalpable matter in ten of the entire soil, I should denominate such a soil sandy, the fertility gradually decreasing as the proportion of impalpable matter diminishes, until absolute sterility is arrived at, which, upon the authority of Sir H. Davy, we may fix at 20 in 400 grains, or one in 20 of the entire soil.

My standards would then come in the following order—

	Impalp. matter.		Fine sand.	Coarse gravel and moisture.
Barren; clay				
Fertile; heavy soils	100 or $\frac{1}{4}$	of the soil	200	100
Fertile; light soils	66 or $\frac{1}{6}$	of the soil	234	100
Fertile; sandy	40 or $\frac{1}{10}$	of the soil	260	100
Barren; sand	20 or $\frac{1}{20}$	of the soil	280	100

Between these standards there will of course be a great many shades of difference, but the character of the soil is easily determined by its approximation to the above figures. Thus, if the amount of impalpable matter in 400 grs. be from 116 to 84 grs., the soils are varieties of heavy soils; if it vary from 82 to 54 grs., they are varieties of light soils; and if it be 50, or 30, or 25, they would be specimens of sandy soils.—*C. R. Bree, Stowmarket.*

(To be continued.)

ON THE APPLICATION OF COPROLITES AS A MANURE.

Mr. Potter has directed attention (*Agricultural Gazette*, p. 10) to some observations I lately laid before the Geological Society on certain nodules, found in the crag formation at Felixton, in Suffolk, and which I have considered to be of coprolitic origin. I believe that this was not before inspected; at least I know that some of our eminent geologists were of opinion that these nodules might be only hardened masses of London clay, which had been rolled into various shapes at the time the crag was deposited, and which had subsequently undergone some alteration in their mineral character. The nature of the evidence upon which I satisfied myself that they were coprolitic need not here be alluded to; but I wish to offer a few remarks upon the probability of their being found useful for agricultural purposes. Liebig has probably allowed his enthusiasm to get the better of his judgment, when, after noticing certain strata containing Coprolites and osseous breccia, he concludes his recently-published letters in this strain:—"What a curious and interesting subject for contemplation! In the remains of an extinct *animal* world, England is to find the means of increasing her wealth in agricultural produce as she has already found the great support of her manufacturing industry in fossil fuel—the preserved matter of primeval forests—the remains of a *vegetable* world. May this expectation be realised! and may her excellent population be thus redeemed from poverty and misery!"

Devoutly as we may all desire such a consummation, let us neither too hastily adopt nor yet too hastily reject these speculations of the German chemist. If he is correct in supposing that the phosphate of lime contained in fossil bones and Coprolites can be economically converted to the same purposes as that in recent bones, his observations will be worthy the most serious attention of Agriculturists; but even if his kindest wishes for our national prosperity are not likely to be realised, coprolitic deposits may still turn out to be of great local importance. Mr. Potter's interesting analysis gives as much as 56 per cent. of phosphate of lime in the coprolitic nodules of the crag! It will be a subject for statistical inquiry whether they can be collected and pounded, or otherwise prepared, with sufficient economy to make them serviceable to the Agriculturist. The collecting iron pyrites by hand along our eastern coast is found to pay well; and certainly it appears to me not improbable that it would require much less labour to collect a ton of Coprolites at Felixton than of iron pyrites. I do not understand why Mr. Potter has supposed there is any difficulty in distinguishing them from pebbles by their external appearance alone; a very slightly-practised eye could never make the mistake. The children employed at the Cornish mines to separate the broken fragments of ores into three or four samples have a much more difficult task, which they accomplish with unerring certainty and wonderful rapidity, and a single day's lesson would be sufficient to teach any one to distinguish these nodules from rolled stones. I do not recollect that they are found in any quantity upon the beach; and the impression on my mind is, that they soon disintegrate or decompose when exposed there. The rounded form which many of them present is not due to attrition, as Mr. Potter suggests, but is the shape they have assumed naturally. Very many of them contain evident traces of the dermic apparatus of crustaceans, and in some instances the entire forms of crabs are distinguishable. This may possibly account for the very high proportion of phosphate of lime which Mr. Potter has detected in them, and it may be important to ascertain whether this character uniformly prevails. In considering these bodies as coprolitic, I do not suppose them all to have been the digested materials devoured by sharks, though some of the specimens affect the character of Coprolites from other formations, which have been so esteemed; but the more common character of these Coprolites is to have the material folded longitudinally, in a thickened convolution round an axis which is frequently perforated. The fold in the intestines of sharks and rays is transverse. It may be worthy of inquiry whether some of these nodules may not have resulted from the presence of animal matter which has never been subjected to the digestive process; and, in connection with such inquiry, is the remarkable fact, that numerous traces of Cetaceans are found intermixed with these nodules. Fragments of their bones occur in considerable abundance, and whilst pursuing the investigation, I picked up what appeared to me a much-rolled portion of the tympanic bone of a whale's ear. This awakened attention, and further investigation furnished me with several specimens. I thought I saw sufficient evidence for believing that these ear-bones must have belonged to four, if not five, species of whale, and I sent them to Professor Owen for his better judgment on such points. He has decided that this is the case, and has drawn up specific characters for four species, referring them to individuals of the genus *Balæna*. The specimen which Mr. Deck has since found I have seen, but I believe it belongs to one of the four species named by Professor Owen. It is certainly a very remarkable circumstance that these Fossil remains should be so very abundant just at one spot in the cliffs, and there associated with so large a number of coprolitic nodules. I notice these circumstances a little in detail, in hopes of awakening further attention to the subject. Very possibly there may be other localities in the crag, where Coprolites are equally abundant; and it may afford others, when spending a few weeks on the east coast, as much amusement as I have myself received in working out their history. It is one of the incalculable advantages which a slight knowledge of natural history is always found to confer, that we cannot visit a spot upon the earth's surface without meeting with a sufficiency of occupation for our thoughts in such investigations as these. I heard Felixton so thoroughly condemned as a watering-place, that some persons would not stay there more than a night or two, and yet it is seated in one of the noblest bays in England, with excellent and safe bathing, possessing a maritime Flora of much interest, with a fine denudation of one of the most remarkable of our British strata, and has, moreover, the alluvial soil filled with fragments of Roman pottery mixed with the well-preserved remains of deer, oxen, and every other description of animal, including snails (!) which the Romans had fed on 1400 years ago, intermixed with coins and other objects of antiquarian curiosity. But if these Coprolites are worth thinking about, I do hope that no time will be lost in testing the question of their value as an agricultural manure. It only requires a small outlay of some 20*l.* or so, to have a number of them collected, properly prepared, distributed in small packets to willingly-disposed experimenters, with a schedule of directions for securing comparative results, and then before another year has passed away we may be in a position to say ay or no to Liebig, and bid him try again. May we hope that some one of our Agricultural Societies may consider the question which is to be solved quite as well worthy an

effort as some others upon which their funds are expended. —*J. S. Henslow.*

Home Correspondence.

Slugs on Wheat.—The method recommended by "S. N. V." in the Number of this *Gazette* for January 6, for preventing the ravages of these mollusca, I found in practice in 1811, among the farmers of West Middlesex, who had adopted it from the market gardens nearer the metropolis; but about that time a modification of the process, at once cheaper and more effectual, was discovered, which superseded the old method. The improvement consisted in giving these gentry a belly-full of food, relished by them more than the Wheat. This was no other than the Turnip-tops, to which, when first used, our slimy friends were supposed to be attracted by the shelter which they afforded in the night, whereas, in reality, they repaired to them for the gratification of their palates. The discovery was made by accident—I think upon the farm of Mr. Newman, of Cranford—during a long course of wet weather, which prevented the gathering of the slugs for some days, at the end of which time it was found that they had devoured the traps set for them, and had spared the Wheat. Not liking the expense of collecting the slugs by women and boys, I had tried sprinkling the field with lime or salt, in the night, while the slugs were feeding, but, though thousands were killed, it seemed as if tens of thousands came to the funeral. From the time, however, that I commenced the feeding system I never lost an acre of Wheat from the slug, though the district, in a mild wet autumn, was very liable to their ravages, on Wheat after Clover. In a very bad slug season, I once covered a 15 acre-field so thickly with Turnip leaves that the surface was scarcely visible, and in less than a fortnight all the leaves had disappeared except the stalks, which remained like the tails of the Kilkenny cats, and on which the slugs were hard at work, without having touched the Wheat, when I served them up a second course. This, however, will seldom be necessary, if the leaves are applied liberally and early after sowing, for in a fortnight or three weeks the plant will in general be too strong to suffer by the bite of the slugs. The feast must, however, be given early, for they commence the attack on the Wheat almost before the plant has shown itself above the surface. The process was discovered, as I have said, by accident, but it shows strongly the advantage to the farmer or gardener of studying the habits of all animals that are noxious to him, and of supplying them with food more congenial to their tastes than that which he wishes to preserve from them. This method, or that of setting a thief to catch a thief, by concluding an alliance offensive and defensive with some other tribe of animals, who wage war with our enemies, will often be found cheaper and more efficacious than taking the work of destruction into our own hands. I think it is Kirby and Spence who have said that the more wasps we have in our gardens the fewer flies shall we have in our parlours—the more lady-birds in our greenhouses the fewer aphides on our Rose-trees; and the Hop-growers in Kent well know the money-value of a swarm of lady-birds. Though not prepared to point out the office performed by slugs in the economy of nature, I have no doubt that an office is assigned to them; for each creature constitutes a link in the great chain of being, dependent upon others which suffer by the diminished numbers of those creatures on which they prey, and which, in their turn, have enemies appointed to keep them within due bounds. The proscription of rooks and sparrows by the collective wisdom of some parishes, in vestry assembled, has been known to have occasioned more loss to the farmer by the ravages of insects than would have paid many times over for the cost of watching his crops against those birds in seedtime and harvest. Of rooks I must observe, by-the-way, that a solution of corrosive sublimate—used as a steep for seed-Wheat, under proper precautions, and in proper proportions—is not only the best preventive against smut I ever met with (and I have tried several), but will also preserve the Wheat from rooks, who just taste it, shake their heads at it, and go off to some other field till the grain has sprouted, when the services of the bird-boy must be put in requisition. Unless, however, care be used, there is danger not only of killing the Wheat, but of poisoning all the pigs and poultry in the farm-yard,—their pampered habits having rendered their wits more obtuse than those of the rooks, whose intellects, naturally acute, appear to have been sharpened by poverty and persecution. With care, however, no danger is to be apprehended. I have used the steep for nearly 10 years with complete success; the only loss occasioned by it being about a dozen turkies and two quarters of seed-Wheat, which occurred in the first year. The necessary precautions, and the details of the process, I shall describe on a future occasion.—*J. Trimmer.*

Urate.—In 1st Number of your *Gazette* an experiment with manures is detailed in which the one I am chiefly interested in does not appear to have answered so well as others, publication of which is calculated to injure me. I inclose you a letter I received from Mr. Reeves, Lord Ashburton's agent, in which he has found quite the contrary effect.—*Ed. Purser, London Manure Co.*—"Taunton, December 2, 1843.—A farm of Lord Ashburton's having fallen into hand, in the parish of Cotleigh, near Honiton, in Devonshire, in very bad condition, I took possession of it in the month of October, 1842, and, with permission of his Lordship, began to farm it. I commenced with an arable field of six acres, which was very wet, and intended to have been sown with Wheat. I thoroughly drained it with stone, at the depth of three feet, but it was too wet to subsoil. I then divided it into separate portions, and amongst many other artificial manures, I applied the London Manure Company's urate as a top dressing immediately after the Wheat (the Taunton White Wheat) was sown, and harrowed the land twice. Besides the artificial manures, I applied lime and farm-yard dung to separate portions of the field. The Wheat on the portion of the land on which the urate was spread, came up with great vigour, and maintained a decided superiority to the whole field during the period of its growth, and yielded ten bushels an acre more than the other parts of the field; and what is very remarkable, there was neither smut nor rust in any part of the Wheat grown on this portion of land, although, on the other parts of the field, both smut and rust were seen. The superiority of the Wheat on the portion of the field before mentioned is so notorious, that all the farmers at Cotleigh can testify to it, and marked its progress during its growth; and I shall feel great pleasure in giving further information to any person wishing more particulars on this subject. Yours, very faithfully, *J. F. Reeves.*" [We are happy to receive *authenticated* reports of the action of the various manures from any person, and if of sufficient importance shall publish them, whatever their tendency may be, our object being to disseminate truth for the benefit of the farmer.]

Malting.—Being desirous of ascertaining the quickest mode of causing Barley to sprout sufficiently for the purposes of malting, in order, if possible, to lessen the time usually occupied in that process, I conducted a series of experiments with that view. You will be aware that if any material be available for that purpose it must be something soluble in water, and which can thus be applied in the water in which the Barley is steeped in the cistern. The different materials I tried, as compared with common clean water, were, salt and water, lime water, ley from wood-ashes, and one or two more, which, though I registered the experiments very minutely at the time, I do not now remember, for seeing no decided result, I did not retain the papers. The objects sought to be achieved, are rapidity of germination, in its first process only, and as large a bulk of material as can be had besides; for if there was a diminution of the article it would cause a loss. These two main points must, if accomplished, be done by something which will be wholesome in itself, and which will impart no disagreeable flavour to the Barley.—*Cardinal Wolsey.* [We should try the effect of moistening Barley with warm water, and then dusting it with *newly-slacked lime.* It might be tried on a small scale, and the result of experiments on the subject would be useful.]

Leases.—Much has been said and written by practical as well as theoretical Agriculturists upon the momentous subject of leases and draining, but, up to the present moment, there does not appear to have been one decisive measure proposed to enable these important objects to be practically applied; and, perhaps, while attempting to recommend, I, as others have done, may fail to succeed: however, by the joint efforts of many, difficult objects may be surmounted, and in that hope I will proceed. First,—I would recommend leases to be granted for 21 years, under conditions suited to the nature and situation of the farm, terminable, if required by the occupier, at the expiration of 6 or 12 years: the rent being regulated triennially, or otherwise, as may be judged expedient, according to the average price of Corn during the 6 preceding years in the district wherein the parliamentary return is made—observing, that the basis of rent at the commencement of each lease should also be fixed upon the same principle of Corn averages. It would be well if farmers in general could be brought to the same arrangement, notwithstanding existing leases. Secondly,—With respect to draining, I would recommend that 10 per cent. of the rent should be laid out annually in draining (if the land requires it, and there are few instances where it does not) during the first 6 years; and that at the end of that term the tenant should pay 4 per cent. for the outlay as additional rent, by which time the land would in a great measure be made dry, and the occupier, during the remaining period of his lease, would be enabled to realise an increased produce, owing to the transformation of his land from wet to dry, and thus have a more genial atmosphere and earlier harvest insured to him.—*An Agriculturist.*

The Berberry Blight.—It may not be uninteresting to such of your readers as have paid any attention to the subject of the supposed influence of the Berberry on the production of mildew in Wheat, to learn that some observations on this matter, by very competent persons, are likely to be published by the Royal Society of Lille, of which I have the honour of being a member. A commission was appointed by the Society last summer, consisting of practical men, in conjunction with that excellent cryptogamist, M. Desmazières, a gentleman who has paid peculiar attention to the parasitic fungi, for the purpose of thoroughly investigating the point; and I understand from M. Desmazières, who joined the commission with an impression that the supposed influence was altogether fabulous, that the result of their inquiries was a complete conviction that a very marked connection did exist between the presence of the Berberry and mildew. When the observations are published, I shall have great pleasure in laying a translation of them before your readers. I do not offer any opinion on the matter myself, but shall content myself with remarking that, though there is not the slightest reason for supposing that the parasite on corn is an altered form of that on Berberry, however extraordinary are the changes which take place amongst these minute plants, as, for instance, that of the Uredo-like spots on the leaves of Roses, and Burnet to Aregma and Xenodochus, there may be some influence exercised either by the exhalations from the leaves and flowers, or by the substance given out by the roots, which may indispose the Wheat plants in their neighbourhood to attacks of mildew. At any rate, in this, as in other matters, the way to arrive at truth is to keep the mind as possible, quite free from prejudice, and ready to weigh impartially whatever trustworthy observations may be brought forward.—*M. J. Berkeley, King's Cliff.*

The Loss of Manure in Towns.—Every shower of rain washes much valuable manure down our public sewers and drains, and thence into the rivers and the sea, and thus while we employ ships in fetching guano from thousands of miles to enrich this country, we wilfully pick up that which lies under our feet. The streets are swept indeed, but little more than the gravel, sand, and dirt is saved; the finest and the richest parts are taken away by the rain. There would be no difficulty in forming reservoirs into which all this might flow, and from which it might be transferred to enrich the ground. But it is of the greatest importance in another point of view that towns should be well drained and cleansed, and as a proof of this I make the following extract from a lecture delivered a few days ago on the sanitory condition of this town, by the Rev. J. Clay, B.D. He stated the number of deaths in the streets of the town, arranged according to the condition of their drainage, as follows:—

Ages.	Good.		Moderate.		Bad.	
	Deaths.	p. ct.	Deaths.	p. ct.	Deaths.	p. ct.
Under 1 year .	2	[illegible]	158 . .	20.8	250 . .	[illegible]
Between 1 & 5 .	26 .	19.3	238 . .	31.3	210 . .	[illegible]
Above 5 . . .	88 .	65.2	364 . .	47.9	192 . .	[illegible]
	135		760		652	

In the best streets the deaths above five were about double those under five; in the moderately-drained streets about equal; but in the ill-conditioned parts of the town the deaths under five were two-and-a-half times as numerous as those above. These facts were striking and appalling.—*Facile, Preston.*

Plan of Pigsty.—This piggery is constructed for the purpose of breeding and feeding on a scale to suit a farm of 600 acres of Turnip soil in an inland situation, where convenient markets render the disposal easy both of fat and lean stock. The seven sties on the end of the steaming house accommodate a boar and six brood sows, which

are calculated to produce yearly 100 pigs, 60 of which will be fattened from September till April in the 15 sties placed in two rows, which will contain two hogs in each apartment. The remainder will be sold as stores. The yearly return will be from 200*l.* to 250*l.*, according to the price of the produce. The steamed food will consist of Potatoes, meal, and grain to finish; and it will be conveyed to the sties along the paved road in a small four-wheeled waggon. The steamer also cooks Potatoes for work horses, and chaff for milch cows; and thus applies the cost to several purposes, and fully employs a man. The store-pigs are fed in summer with Clovers and Vetches, and in winter with steamed and raw roots. Water is brought to the steaming-house in a pipe from the farm-yards, which are all supplied by ball cocks from elevated casks, fed by a forcing pump; a pipe underneath conveys the water from the Potato-masher to the pond in the store yard, whence it passes to the lower corner of the yard, where it meets with the collected water of the whole area of the piggery, falls through an iron grate into a paved culvert, and is conveyed to the manure pit, to which the liquid of the farmery is collected by a drain along the side of the road. The expense of this piggery will vary from 80*l.* to 100*l.*, according as the roof be slate or tiles, and according to the local prices of labour and materials. The steaming-house is floored above for holding meal and grain for steaming, and the roots are laid on the ground-floor, and let in from the carts by a spout-hole in the wall.—*J. D.*

Cultivation of Flax.—By their neglect of the cultivation of Flax the farmers and landowners of this country have sadly overlooked their own interests. Flax is consumed in this country to the amount of 67,000 tons annually, the value of which at a low average amounts to between 4,000,000*l.* and 5,000,000*l.* sterling. Every pound of this raw material is imported from our industrious Continental neighbours—the French, Dutch, and Belgian

1844.

[illegible] I have had seven years' experience as a grower of Flax, and 13 years' practical knowledge as a buyer and [illegible] for several of the largest Flax-spinners in Leeds, Manchester, and Preston; and I am prepared to [illegible] landlords and farmers my views, which, if [illegible] them, will soon stop the call for Belgian, [illegible] Dutch, or Riga Flax; and thus we shall keep the [illegible] ering in the hands of our own farmers, [illegible] ng it abroad. All the difficulties in the [illegible] ture of Flax may easily be overcome, unless [illegible] the Irish superstition, which imagines that St. Patrick [illegible] the Shamrock shores and the county of Down, [illegible] in view of the Lancashire coast, he would [illegible] I am prepared to prove that there is as [illegible] to Lancashire, and other parts of England, for [illegible] of the Flax-plant, as in Ireland, France, [illegible]; and, as I can also prove, that farmers can, by [illegible] Flax, clear greater profits per acre than they can [illegible] Wheat or Barley. There have been instances [illegible] per acre, clear of all expenses, made this year in [illegible] of Ireland by parties who went to work on the [illegible] system. Intelligent young farmers have of late [illegible] been sent to Belgium and France, and by them, [illegible] to the adoption of an improved management, the [illegible] of British Flax has been greatly improved. The [illegible] grown in our country has also increased so much, [illegible] at the last meeting of the Society in Ireland for the [illegible] movement of Flax Culture, one spinner declared that [illegible] he generally paid 40,000*l.* per annum to the [illegible] Continental growers for Flax, and that the last year he has [illegible] paid 40*s.* I can prove that the small farmers, holders [illegible] of from 30 to 60 acres of ground, can now make by an [illegible] acre, or two acres of Flax, what will pay their rent for 30 [illegible] acres. This never could be done by six acres of [illegible] any other kind of grain. This almost new and improved [illegible] system has so extended itself, that branches of the society [illegible] for improvement have been established in every direction. In the North, 112,000 acres were sown last year, and the [illegible] calculation is, that the value of the produce at the low [illegible] price of 45*l.* per ton would amount to 1,767,150*l.* At [illegible] the same time, I know that some has been sold so high [illegible] as 140*l.* per ton, and a great deal at 64*l.* and 100*l.* per ton. I have had many years' experience and know well the processes that the Flax plant must go through before it appears in the beautiful white cambric, damask, or linen—the processes of sowing, weeding, pulling, watering, [illegible]g, [illegible]kling, spinning, and weaving. I shall have pleasure in giving you every information in my power on this subject from time to time.—*J. H. Dickson*, 8, *Manchester Buildings, Whitehall.* [We are sorry that we could not insert the whole of Mr. Dickson's letter. We shall be happy to receive the communications on this subject which he promises.]

Wireworm.—I know not whether it may be generally known that pheasants are destroyers of that mischievous grub, the wire-worm; it may possibly, therefore, be acceptable to some of your agricultural readers to be informed that such is really the fact. A correspondent of the "Sporting Magazine" writes, "that no fewer than 122 of those destructive larvæ were taken from the crop of a hen pheasant in January last." Consider, that this is only one day's consumption! It thus appears that pheasants are of some benefit to the farmer.—*A Quiet Observer.*

Societies.

HIGHLAND AND AGRICULTURAL SOCIETY OF SCOTLAND.

The anniversary general meeting of this Society was held on Jan. 9th, in their Hall, Albyn-place. There was a large attendance of the members. The Right Hon. the Earl of Mansfield, one of the Vice-Presidents in office, took the chair. The first business before the meeting was the balloting for new members, when 38 candidates were unanimously elected. The Duke of Richmond was then re-elected President of the Society for the ensuing year, being his fourth year in office; and the Marquis of Queensberry and the Earl Cathcart were elected Vice-Presidents in room of the Earl of Seafield and Lord Dunfermline, who retire by rotation. Among other matters then submitted to the meeting, the Secretary stated the results of the competition for the premiums in the year just expired. There had been 14 papers sent in, reporting experiments with various special manures, and no class of premiums, in the remembrance of the oldest Director, had given rise to a more satisfactory competition. The first premium of 50*l.* was awarded to Mr. John Hannam, Wetherby, Yorkshire; the second premium of 30*l.* to Mr. Alexander F. Gardiner, overseer to Mr. Fleming of Barrochan; the third premium of 20*l.* was equally divided between Mr. Finnie, Swanston, and Mr. Stevenson, Redpath, near North Berwick, these two papers being considered of equal merit. But not satisfied with these awards, the Directors considered the other ten papers of so much value as to induce them to recommend that they also should be printed for the benefit of the public. They therefore proposed that an extra sum of 53*l.* should be appropriated to awards for these papers. The circulation of the "Quarterly Journal of Agriculture," in which the Prize Essays of the Society are published, was stated to amount to 2500. The thanks of the Society having been voted to its office-bearers on the occasion of the late Show at Dundee, arrangements were made for the nomination of a Committee to superintend all the arrangements for the Agricultural Meeting and Show of Live Stock to be held at Glasgow on the 7th, 8th, and 9th August next. The report of the Committee on Cottage Premiums was then read, and it was stated that 20 parishes had competed for the premiums of the Society; that in one of these, 21 cottages had competed, and in another 15. Earl Cathcart, Chairman of the Committee on the Museum, reported on the state of that establishment. Every facility continues to be afforded to the public of free admission to examine the numerous and valuable objects which the collection exhibits in its various departments; and a reference to the visitors' book gives satisfactory proof that the privilege of admission is duly appreciated. It has been opened only two years and a-half, and within that time 17,585 have inscribed their names as visitors. Donations of models of implements, seeds, roots, plants, timber, and geological specimens continue to be received and added to the collection. Not the least interesting of these are the samples of agricultural produce from the various Local Associations, thus enabling them to form a comparative estimate of the value of the crops throughout the country. Towards the close of the meeting, Sir John Graham Dalyell stated that he had often wished that some gentleman would devote his attention to the drawing up of a short history of this Society, which had rendered such immense benefit to the country. The first Agricultural Society that ever existed in Scotland he found was instituted in 1723; the next was in 1755; and the present patriotic and powerful Society was begun just 60 years ago. He thought all that was to be desired might be condensed into a brief memoir, which the members might find both agreeable and useful. He had collected various notes on the subject himself, which he would be happy to hand over to any gentleman who would undertake this task. The business being concluded, thanks were voted to the noble Earl in the chair, after which the meeting separated.

AGRICULTURAL SOCIETY OF IRELAND.

The council of this Society held their weekly meeting on Thursday, January 11. A report on the profitable reclamation of waste lands in the King's County was received from W. S. Trench, Esq., of Monaghan. Reports, competing for the Society's gold medal, for the greatest quantity of draining executed in Ireland for the years 1842 and 1843, were also received from several gentlemen. Committees were appointed for their examination. A sub-committee was also appointed to select and report upon the best and most eligible situation for holding the next great cattle show in or near Dublin, on the 14th of August next; and the council then adjourned until Thursday, the 18th instant, at two o'clock.

AGRICULTURAL CHEMISTRY ASSOCIATION.

The Annual General Meeting of the members of this Association was held on Jan. 8th, in the Highland Society's Museum, Lord Melville in the chair. From the Report by the Committee of Management, it appears that the society is rapidly increasing in number; nearly a sufficient sum has been subscribed as the salary for 5 years, of their chemist, Prof. Johnston. The Professor is now resident in Edinburgh, and is amply provided with all the requisite apparatus, and with three able assistants, whom he has engaged at a considerable cost. Two of these are foreigners, and all of them experienced chemists. They have already begun work, and indeed for the last few weeks have been actively engaged not only in answering letters of advice, but in analysing soils sent them from different parts of Scotland, and also from Jamaica and Demerara, by subscribers there, and in examining likewise various marls, and specimens of guano, oil-cake, turnips, &c., which have been forwarded from all quarters of Great Britain and from Ireland. Two important additions have been made to the regulations of the society. By the one, counties subscribing 20*l.* yearly to the Association have the privilege given them of sending a member of Committee of the Board of Management. The other regards a point which was stated at last general meeting to be under consideration, viz., the terms on which local Agricultural Societies should have lectures from Professor Johnston. These have now been fixed at 5*l.* for each lecture, which are not to exceed three in number, besides the travelling expenses of Professor Johnston, and this regulation appears to be giving satisfaction. Already application has been made by various agricultural societies in the counties of Renfrew, Ayr, and Fife, for lectures, and it is understood that the example will soon be followed by others. The state of the funds has improved greatly since last general meeting. Some very handsome contributions have been received. That of the Duke of Northumberland, of 30*l.*, merits especial notice, as an instance of disinterested liberality—since his Grace possesses, it is believed, no property in Scotland. Nor must the conduct of the West Lothian Agricultural Society, in contributing 10*l.*, pass without remark, as it evinces an enlightened zeal in the ranks of our practical agriculturists.

FARMERS' CLUBS.

Maidstone.—The annual report which was read at a late meeting of this club records the resolutions of the club on the various subjects discussed during the past year. Among them the following seem of general importance:—At the March meeting on the subject of feeding off Wheat, it was resolved, "That it is the opinion of the members that no good is derived from feeding off Wheat, but that the treading of Wheat, or rolling it with the clod-crusher on light soils, is considered extremely beneficial, and that good crops have resulted from these operations, by which the wire-worm has been checked, and the soil effectually closed." On October 5th the subject of discussion was the cultivation of Wheat, which resulted in the following resolution:—"That on land where it is practicable, creasing or drilling is always preferable, as two bushels of seed thus used will be found equal to at least two and a half bushels sown broad-cast. Dibbling, when labourers can be got to do it properly, will cause a still greater saving of seed and give greater employment. That in this district the quantity of seed usually considered necessary is from two bushels to two and a half bushels, according to the lateness of the season; but that the system of thin sowing, as recommended in Mr. Davis's recent pamphlet, appears highly deserving of consideration and experimental trial."

Rhins of Galloway.—The first monthly meeting of this Club was held at Stranraer on Friday, 29th Dec. Mr. M'Bryde, the Secretary, delivered an interesting address descriptive of ancient Agriculture, and afterwards opened a discussion on the growth and cultivation of Wheat. A variety of communications upon this subject received by him from farmers in various parts of the kingdom were read to the meeting, from most of which it appeared that Hunter's Wheat was a hardy and profitable variety, and that it was advisable to change the seed every two or three years, taking care always to obtain it from a better and earlier soil and climate.

GEOLOGICAL SOCIETY.

Native Phosphate of Lime.—At the last meeting of this Society, Professor Daubeney read a paper on the occurrence of Native Phosphate of Lime in the province of Estramadura, in Spain. This salt occurs near Guadaloupe, and forms a vein running between the clay slate for about two miles, and is about 20 feet in breadth, and, as far as could be ascertained, 10 feet in thickness. Dr. Daubeney examined this formation with an especial view to ascertain the possiblity of its being used in this country as an article of manure. There are, however, great difficulties existing with regard to carriage, which, on account of the unsettled state of the Peninsula, would be serious. If, however, there should at any time be a scarcity of bone manure, it might be brought to this country as a substitute. No experiments have at present been tried with this mineral as a manure, but there can be little doubt that it would act efficiently, where plants require Phosphate of Lime.

Rebiews.

Productive Farming; or, A Digest of the Recent Discoveries of Liebig, &c. By Joseph A. Smith, Lecturer on Agricultural Chemistry. Second Edition. Simpkin, Marshall, and Co. 8vo., pp. 179.

It is not to be expected that farmers, as a body, should be capable of applying scientific laws to the improvement of Agriculture. In the process, however, of thus applying those laws they have a very important part to perform. They have not only for the most part to supply the materials, a consideration of which enables the scientific man to suggest improvements in their practice, but they have also to carry out these suggestions into actual trial, and to determine on the farm their real value to the farmer. Their assistance is thus required from first to last in the work of Agricultural improvement, and in order, on the one hand, that they may be able to select and state properly such facts as bear on any subject that may be under consideration; and on the other that they may be able to appreciate the suggestions founded by the scientific man upon these facts, it is of great importance that they should possess a general knowledge of the relations in which farming in its various branches stands to some of the sciences. We are therefore glad to see works of the class to which Mr. Smith's little volume belongs increasing in number.

"This book is a compilation. The object of its compiler has been the simplification of the more strictly scientific and technical writings of the principal Agricultural writers of the present age." So says its Preface. The object of its Author is a good one, and the plan laid down for its attainment has been skilfully executed.

The possibility, and indeed the certainty, that the application of scientific knowledge will eventually simplify and cheapen the farmer's practice, is well illustrated by Mr. Smith in parallel cases drawn from other arts and professions. Thus—

"Calico printers for a long time have used the solid excrements of the cow in order to brighten and fasten colours on cotton cloth. This material appeared quite necessary, and its action was ascribed to some latent principle or material derivable from the living animal. But since the action of cow-dung was known to depend on the *phosphates* contained in it, it has been completely replaced by a more cleanly mixture of certain salts, of which the most prominent is *phosphate of soda.* So, in medicine, for many centuries the mode of action or the active principle of all remedies, was veiled in obscurity. But now these principles have been presented to the world in an extremely active and concentrated form. The extraordinary efficacy of Peruvian Bark in the cure of fever is found to depend on a minute quantity of a crystalline substance termed *quinine* contained in it. The inhabitants of Savoy are much infested with the disease known amongst us as 'Derbyshire neck.' *They* have springs which are famous for its cure; *we* derive benefit from the use of burnt sponge. Now, burnt sponge contains iodine; and upon examination these springs contain iodine in small quantities."

Apply all this to Agriculture and we may be sure that—"A time will come when fields will be manured with saline solutions, with the ashes of burnt straw, or with salts of phosphoric acid prepared in chemical manufactories, with as much certainty as now, in medicine, iodine cures the 'Derbyshire neck,' or as quinine is substituted for the bulky powdered bark in fever."

The Book of the Farm. By Henry Stephens, Editor of the "Quarterly Journal of Agriculture." Part XVII. William Blackwood and Sons.

A more specific title than the above would not properly designate this Work. Mr. Stephens goes into such detail on every subject which he discusses, that he appears

to aim at making his "Book of the Farm" suitable as a substitute for a whole Agricultural library. Though eminently a practical treatise on Agriculture, this Work is frequently illustrated by scientific explanations. These are from the pen of Dr. Henry R. Madden, of Penicuik, near Edinburgh. In the present Part, the Author continues and concludes his remarks on the treatment of stock in summer, and takes up the important subject of the weeds of Agriculture.

The only fault we have to find with this Work is its prolixity. Notwithstanding that it is specially addressed to Agricultural pupils, and must therefore enter fully into detail, yet it might be advantageously condensed. Mr. Stephens is already greatly beyond the original limits laid down as the extent of his work, and as he has not yet got nearly through all the subjects to be treated of in it, if in that which remains he does not adopt a more condensed style, the "Book of the Farm," though certainly complete as a work of reference, will ultimately be very expensive.

Miscellaneous.

Thorough Draining.—You are quite aware that your soil is wet, and your climate is wet; and I am sure that you all must have seen that wherever there is a piece of land drier than another, you find it a fertile soil. That dryness has been affected, in some measure, by nature; but art should follow up what nature has pointed out as advantageous. If we would proceed to do so—if we would actively set to work—I am persuaded that we could soon extend fertility over the whole soil of this splendid country. If landlords and tenants, on an extended scale, would unite their energies, the landlord in assisting the tenant, and the tenant in supporting the landlord, we would soon see the country around us converted into a fertile garden. It is quite clear, from the attention which has been paid to this great meeting of the agricultural interest by extensive land-proprietors, that there is no want of an anxiety for the improvement of Irish agriculture. While this spirit of anxiety exists, the question put by the tenantry is—where are the funds to come from? We see the necessity for improvement; we would wish to have a good system of agricultural affairs; but where are the pecuniary resources? That is the great difficulty; but it is not incapable of being obviated. The improvement should be actively and extensively carried on by the landlords themselves. They are possessed of wealth, and they should not be afraid to lay it out on their property. It will not be thrown away. No man can finally be a loser by the improvement of his property. I can speak from experience and from extensive observation; and I know that there are hundreds of landlords in this assembly who can bear me out in the statement—that if money be laid out extensively in thorough-draining, they will not regret the expenditure. The grand secret in thorough-draining is to adopt the more substantial mode instead of the cheaper; and I would take this opportunity of warning both landlords and tenants against the danger of doing the thing superficially. When once effected, the improvement is permanent. It is a lasting good. It should be done in the most permanent manner. You should not, by any means, stint the number of drains, but you should take care to drain the land thoroughly, for I would almost as soon not see the work set on foot at all, if it were not to be fully and satisfactorily completed. There is abundance of skill and knowledge in the country; and if you would take pains to bring that skill and knowledge to bear in a proper manner, I have no doubt the work would be well and permanently accomplished. The depth of the drains is an important point. I certainly am of opinion that the drains should be at least two and a-half feet deep, and then you will have a much more perfect drain than you could possibly have by a shallow drain.—*Mr. Smith, of Deanston, at the recent Meeting of the Irish Agricultural Society.*

Lever Turnip Slicer.—I beg to say, that on cutting a basket of Aberdeen Turnips, which serve as a feed for two heifers, and which weighed without the basket 5 st. 4 lbs., this implement performed the work without hurry in one minute and about ten seconds, or rather under. It would take nearly half the time to put them into the basket without cutting. A little boy who assists in my yard supplied them to the machine out of the heap, but I think the person who cuts could do all in one minute and a half at most.—*F. G.—Dublin Farmers' Gazette.*

Notices to Correspondents.

COMMUNICATIONS from the following CORRESPONDENTS are in type, and are only waiting till room can be found for them:—*J. Snow* and *A. Campbell*.

AGRICULTURAL EDUCATION.—*R. P., A Subscriber.*—The counties in which a person may best obtain a thorough knowledge of practical farming in every branch are situated on the eastern and northern coasts—say Norfolk, Lincolnshire, and Northumberland.

APPLICATION OF CHALK.—*A Novice.*—From Sprengel's work on Inorganic Manure, which is being published in this Paper, you will understand the action of lime on a soil. It unites with the humic acid, which is one of the forms that decomposing vegetable matter assumes in the soil, and forms with it a compound soluble in water, by which it is conveyed into the plant. When too much lime is added to the land all the available humus is immediately appropriated, and being thus conveyed into the plants, causes them to grow vigorously; but unless manure be soon applied to compensate for this loss of humus, the soil will become exhausted, which is too often the case under the rapacious cultivation of some who have only a yearly interest in the land. The carbonate of lime, as in chalk, acts in a similar way, but more slowly, and therefore more safely. We do not think it would be advisable or economical to burn the chalk. Perhaps its efficiency depends in a measure upon its containing phosphoric acid in small quantities, which Professor Brande informed us in his late lecture, is an ingredient of some varieties. If so, its value is independent of the influence which a red heat would have on its composition; and it is difficult to account in any other way than this for the benefit which, in the case of chalk, the farmer derives from *repeated* applications to the surface of his land, of the material dug immediately out from beneath it.

APPLICATION OF GUANO.—*Northumbriensis.*—You had better apply it before the end of April—the earlier the better. If the field is to be fed later than that, apply it as soon as the cattle are shut out.

BOOKS.—*A. R.*—You cannot get all you want in any *one* book, unless it be an Encyclopædia, and perhaps "Johnson's Encyclopædia of Agriculture" would suit your purpose better than any other. The best treatise on the management of poultry in all its particulars is that by Peter Boswell, Greenlaw, entitled "The Poultry Yard."

CHICKWEED.—*A Subscriber.*—We know of no other plan for destroying this weed than the diligent use of the hoe. If there be a danger with some of your crops of hoeing up the young plants with the weeds when just above ground, sow in the drills with them some Oats; these will spring up first, and show you where the others will come after, so that you may use the hoe between the rows without danger.

DRAINAGE.—*A Subscriber.*—We have seen land, such in its texture as you describe, perfectly drained with stone drains, 30 inches deep, and 16½ feet apart. Their direction was down the greatest descent.

ENGLISH FURZE.—*A new Subscriber.*—It is the English variety which is employed. The Messrs. Ransome, of Ipswich, manufacture an efficient gorse-crusher. We shall ascertain for you further particulars regarding its use as food for cattle. Lucerne where grown on deep loamy soil may be depended on for feeding stock from May till October.

ITALIAN RYE.—*A.*—We have communicated your desire to Mr. Parkinson. We understand the M. Wurtzel, otherwise suitable as food for milch cows, is not very productive of *richness* in the milk.

LIQUID MANURE.—*A Subscriber.*—Your letter has been received, but we very rarely insert among our Home Correspondence any which merely ask questions. We either answer the questions they contain, or place them in the hands of persons competent to do so; simply publishing the answer. The quantity of sulphuric acid necessary to fix all the ammonia in a given quantity of urine will depend upon the strength of the two liquids—the latter varies considerably in the quantity of ammonia which it contains. As long as any effervescence attends the addition of the acid, you may be sure that ammonia still exists in the urine in a volatile state. This rule will also determine the quantity of muriatic acid to be added when it is used instead of the oil of vitriol. The necessary quantity of sulphuric acid, when the acids are as strong as those usually sold, will be found to be one-third less than that required of muriatic acid. We prefer sulphuric acid as a fixer of ammonia; the sulphate, in all the experiments on the subject that we know, has proved a more powerful fertiliser than the muriate of ammonia. Muriatic is quite as dangerous as sulphuric acid among ignorant workpeople. Unburnt gypsum contains rather less than one-half its weight of sulphuric acid; therefore, if you find that a certain weight of oil of vitriol fixes all the ammonia which it contains, you may be sure that double that weight of "powdered unburnt gypsum" would produce the same effect.

MANURES.—*G. Sherborn.*—The mixture you propose would be suitable, but the quantity you propose to apply to an acre appears to us too large; and do not drill it with the seed, but scatter it broadcast, and harrow it well in before sowing; the young plants will find it out soon enough. For the nature of gas-lime see answer to question on the subject in No. 2 of the *Agricultural Gazette*. Analyses of the matters you refer to are to be found in chemical works.

MANURING GRASS LAND.—*H. Bellairs.*—July or August is the best time for manuring Grass land, to be mown the next year. The autumnal rains wash it into the ground. We shall take the subject up at the proper time.

MASTER AND SERVANT.—*!!!*—In England, the servant could complain to a justice of the peace, who could, if the servant proved that the *meat* was not of the kind usual and proper in such cases, discharge the servant from the service. The justice, however, could not make any specific order directing the master to supply better meat. The servant could also bring an action for breach of contract. We do not know what provision the Scotch law makes for such cases.

PIGEON DUNG.—*Mæcenas.*—Mix this dung with plenty of fresh mould, and it will then remain safely till you are ready to apply it. Powdered gypsum added to the compost would still further hinder the escape of the volatile constituents of this manure.

SALT AND LIME.—*A Subscriber.*—We shall answer your question next week.

SEED-WHEAT.—*A Subscriber* may sow Wheat now, if his land be dry. We have been sowing during several days of the past week. Red-straw White Wheat and Shirreff's White are two excellent varieties, which, as far as our experience goes, are suitable either as winter or spring seed.

TILE-MAKING MACHINES.—*S. A.*—Etheridge's machine is preferable to that of the Marquess of Tweeddale.

WASTE OF BONES.—*Anonymous.*—You must gather them together and take them to a bone-mill. We know of no other way; unless you make a compost with them and ordinary farmyard dung. Add dilute sulphuric acid, which will probably assist in decomposing them.

*** As usual many communications have been received too late for answering this week.

Markets.

SMITHFIELD, MONDAY, Jan. 15.—Per stone of 8 lbs.

Best Scots, Herefords, &c.	3s 10	to 4s 2	Best Downs & Half-breds	4s 0	to 4s 6
Best Short Horns	3 8	3 10	Best Long-wooled	3 10	4 0
Second quality Beasts	3 2	3 6	Ewes and second quality	3 4	3 8
Calves	4 0	4 10	Pigs	3 4	4 4

NUMBERS.—Beasts, 2952; Sheep, 29,000; Calves, 69; Pigs, 289.

There being a larger supply, both of Beef and Mutton, to-day, the trade is heavier. The best quality of Beasts, however, are not at all plentiful, and are readily sold at the above quotations; and in some instances, but very rarely, the choicest things have made 4s. 4d. The best Mutton is rather more plentiful to-day than of late, and suffers a decline in price—the most selling Downs not making more than 4s. 6d., the more general price being 4s 4d. for the very best. Good Calves are scarce, and continue as dear. The Pork trade is a little more cheerful.

FRIDAY, JAN. 19.

To-day there is very little alteration from Monday's quotation: Beef is a shade lower; Mutton continues about the same. There is a still shorter supply of good Calves, with an advance in price—the very best are readily sold at 5s. 2d. per 8lbs., and in some few instances rather more than that is obtained. A slight improvement in Pigs.

NUMBERS.—Beasts, 522; Sheep, 3010; Calves, 147; Pigs, 360.

41, West Smithfield.

POTATOES, Jan. 15.

SOUTHWARK WATERSIDE, Jan. 15.—There have been but few arrivals since our last, yet the market continues sufficiently supplied with former arrivals, especially with York Reds; the inferior samples from that country go off heavily, but the best samples from all countries meet with a ready sale. The weather during the past week continues remarkably fine and open for the season, and the Town markets are abundantly supplied with Vegetables selling unusually cheap: notwithstanding which our late quotations have been fully realised.—Prices as annexed:—

York Reds	60s	to 80s	Kent and Essex Whites	50s	55s
Perth	60	65	— — Kidneys	—	65
Early Devons	65	70	Wisbeach Kidneys	—	60

KINGSFORD AND LAY.

MARK LANE, FRIDAY, JANUARY 19.—The arrivals of English Wheat are quite exhausted, and Monday's currency will, no doubt, be fully maintained; free Foreign is exceedingly dull, although Monday's prices are demanded. Barley is dull, but fine qualities do not give way. Peas and Beans remain the same. The Oat Trade continues as on Monday, with a fair sale.

KINGSFORD AND LAY.

COVENT GARDEN, Jan. 19.—The Market has been well supplied during the week, but trade is not brisk. Pine-apples are sufficient to meet the demand, they are selling at nearly the same prices as last week. Hothouse Grapes are scarce, but Portugals continue plentiful; they have not advanced since our last report. Apples continue equal to the demand, and are selling at from 3s. 6d. to 10s. per bushel. Among Pears a few of the Passe Colmar are still in the Market; Ne Plus Meurts is also to be met with, but these are becoming scarce. Oranges are plentiful, and Lemons are sufficient for the demand. Filberts are abundant. Vegetables in general have been pretty liberally supplied during the week. Cabbages are good and plentiful, and are likewise Brussels Sprouts and Greens. Broccoli is rather scarce. Seakale and Rhubarb are plentiful, the latter in particular is very good and abundant. Parsley continues to bring nearly the same prices as last week. Asparagus has become rather scarce, it has also advanced in price since our last report. Endive is good and plentiful, and Shallots are abundant. Celery is sufficient to meet the demand, but is rather inferior in quality. The flowers are chiefly composed of Erica gracilis and hyemalis, Poinsettia pulcherrima, Bignonia venusta, Correæa speciosa, Geranera zebrina, Lily of the Valley, Pelargoniums, Fuchsias, Cinerarias, Chrysanthemums, Camellias, Azaleas, and Roses.

FRUITS.

Pine Apple, per lb., 4s to 7s
Grapes, hothouse, per lb., 3s to 7s
,, Portugal, per lb. 1s to 2s 6d
Apples, dessert, p. bush. 3s 6d to 10s

Horse Radish, per bundle, 1s to 5s
Radish, spring, p. doz. bands, 1s
Carrots, p. doz. bun., 2s 6d to 5s
Spinach, per sieve, 1s 6d to 2s
Leeks, per doz. bun., 9d to 1s
Garlic, per lb. 6d to 8d
Onions, Spring 1s 6d to 4s p. bush.
— Large, per bushel, 2s to 3s
— Spanish, per doz., 1s 6d to 2s
— pickling, p. hf.-sv., 2s 6d to 3s
Shallots, per lb., 6d to 9d
Chilis, per 100, 1s to 2s
Lettuce, Cabb., p. score, 6d to 1s
— Cos, per score, 6d to 1s
Celery, per bun., 6d to 9d
Mushrooms, per pottle, 6d to 1s
Walnuts, per bushel, shelled, 12s to 14s
Small Salads, per punnet, 2d to 3d
Watercress, per doz. sm. bun. 3d to 4d
Parsley, per doz. bunches, 2s to 3s
Tarragon, Green, per bun. 4d to 6d
Endive, per score, 9d to 2s
Green Mint, 4d to 9d per bunch
Marjoram, green, p. doz. bun. 2s to 3s
Chervil, per punnet, 2d to 3d
Salsafy, per bundle, 1s to 1s 6d
Scorzonera, per bundle, 1s 6d

HOPS, FRIDAY, Jan. 19.

WE can quote no alteration in the Hop Market since last week. Prices fully maintained, and the stock in offer very limited, at the following currency:—

Mid & East Kent Pocks.	8l 0s	to 10l 10s	Sussex Pockets	-	6l 6s to 7l 7s
Choice ditto - -	11 0		Choice ditto	-	6 10
Weald of Kent Pocks.	6 0	6 15	Farnham	-	9 10
Choice ditto - -	7 0				

PATTENDEN & SMITH, Hop-Factors.

HAY, SMITHFIELD, JAN. 19.

HAY, 2l 10s to 3l 10s | CLOVER, 3l 10s to 4l 15s | STRAW, 1l 4s to 1l 8s
Per Load of 36 Trusses.
JOHN COOPER, Salesman.

WHITECHAPEL, Jan. 19.

Hay - 2l 10s to 3l | Clover 3l 15s to 4l 8s | Straw, 1l 4s to 1l 8s
— fine Upland, 3l 5s to 3l 15s | — fine, 4l 10s to 5l
Supply short, and trade dull.

WOOL.—BRITISH, FRIDAY, Jan. 19.

CONSIDERABLE excitement has existed in our Wool Market during the past week. Those houses who are generally speculative have bought freely at rather advanced rates. For our own part, we see nothing in the reports from the manufacturing districts to lead us to suppose that any material advance in price will be permanently maintained.

PRICES CURRENT.

MARK FORSAITH.

NEWSPAPER OFFICE, 15, Coventry-street, Haymarket, London.—Established upwards of 30 years.

T. [illegible] and SONS, Agents for the supply of the [illegible]ENERS' CHRONICLE AND AGRICULTURAL [illegible]ware that and all the other London Newspapers [illegible] which may be had on application), with the [illegible]rity to all parts of the Kingdom, and to the [illegible] postage; and by the Morning Mails if requisite. [illegible]eg to state that they print the entire address of [illegible]s on the wrapper, when ordered for six months or longer.

HOT-WATER APPARATUS FOR HEATING HORTICULTURAL BUILDINGS, DWELLING-HOUSES, CHURCHES, and MANUFACTORIES, upon improved principles, and at very moderate charges, erected by DANIEL and EDWARD BAILEY, 272, HOLBORN.

D. and E. BAILEY having devoted much time to the consideration of this subject, and had much experience in the erection of apparatus for the above-mentioned purposes, have, by improvements in their practice, rendered their mode of heating very efficient, but very simple, and have combined [illegible] apparatus with economy in the charge. They [illegible] apparatus in England, Scotland, and Ireland, for [illegible] and gentlemen, and have had the honour to be [illegible]rticultural Society of London, in executing the [illegible] splendid Conservatory, lately erected at Chiswick. D. and E. BAILEY also construct in metal all descriptions of [illegible]uildings and Sashes, and invite noblemen, gentlemen [illegible] to an inspection of their various drawings [illegible]272, Holborn, where they have the opportunity of [illegible] other metal works, an extremely complete and [illegible]en apparatus, or range, adapted for the continued [illegible]water, and an arrangement of the oven more completely [illegible] hitherto been brought before the public.

D. and E. BAILEY were the first to introduce metallic curvilinear [illegible]rticulturists, and can refer to the Conservatory [illegible] to the Pantheon as one of their works, besides many others in this country and on the Continent.

D. and E. BAILEY have prepared a quantity of the Galvanic Plant Protectors, which are now ready for immediate delivery; they beg to introduce to public notice a new Trough Pipe, for [illegible]s or other Houses where vapour is constantly, or at [illegible] required, and which may be seen at their Manufactory.

RENDLE'S TANK SYSTEM OF HEATING.

STEPHENSON AND CO., 61, Gracechurch-street, London, Inventors of the IMPROVED CONICAL and DOUBLE CYLINDRICAL BOILERS, having been much engaged [illegible] buildings upon the above system with Tanks of [illegible] materials, solicit the attention of scientific Horticulturists to an Iron Tank now fitting up on their premises, which [illegible] decided advantages over every other article hitherto [illegible] for the same purpose. These tanks which are ornamental in appearance can be made from 10 to 100 feet long and [illegible] width and depth, and can be connected or disconnected by any working Gardener without the slightest difficulty, thus affording the opportunity to persons in remote districts of [illegible] much approved method of heating without the [illegible] of engineers. The Tanks can be applied to Boilers and Pipes already fixed, and from the present low price of Iron will be found cheaper than of any other material. MR. RENDLE, of Plymouth, has kindly undertaken to receive orders and furnish information to any persons in his neighbourhood, and prices for any size will be forwarded upon application to S. and Co.

THE CONICAL HOT-WATER BOILERS, invented by J. ROGERS, Esq., may be obtained of any size from JOHN SHEWEN, Ironmonger, &c., Sevenoaks, Kent.

J. SHEWEN having had every opportunity afforded him by an extensive practice to bring this apparatus to perfection, begs to offer it as most efficient and economical: it may be seen at Messrs. Chandler & Sons' Nursery, Vauxhall; Messrs. Loddiges', Hackney; Messrs. Henderson's, Pine Apple-place; Messrs. Veitch and Son's, Exeter; Mr. Pontey's, Plymouth; the Royal Botanical Society's Gardens, Regent's Park; and at the Gardens of the Horticultural Society of London. Considerable improvements have been effected since last season; particulars of which are in course of preparation.

IMPROVED PLAN OF [H]EATING.

J. WEEKS, JUN., and Co., Gloucester-place, Chelsea, beg to inform their friends in the Gardening Profession, that they will be happy to meet them at their Annual Dinner, on THURSDAY, Feb. 1. Those who will favour them with their company are requested to communicate as soon as possible.

BURBIDGE AND HEALY beg respectfully to inform the Horticultural World, that they are quite ready to supply their new BOILER, of every size: they have now fixed a sufficient number to warrant them in stating that what they put forth as the qualities of their Boiler and Furnace arrangement may be perfectly relied upon; they have put up one at the Horticultural Gardens, where B. and H. believe it is considered to be unrepresented; they have also fixed it in connection with [illegible] description of Iron Tank, which combines the qualities of [illegible] and the open tank, which may be pronounced [illegible] for the purpose of a Heating Apparatus for Horticultural purposes, [illegible] for Graperies, Epiphyte-houses, Melon-pits, &c. &c. The arrangement is such that any gentleman or gardener may [illegible] constructed, so as to be put together with the [illegible] facility by the gardener, first sending a correct plan [illegible] Fleet-street. A Prospectus may be had detailing the [illegible] &c.

CHEAP FUEL FOR HOTHOUSES AND STOVES.—Coke, the same as used by the Horticultural Society, to be had in large quantities, at very reduced prices, at the Phœnix Gas Works, Bankside, or Greenwich.

P. ROE, 70, Strand, London.

Every kind of Garden and other Pumps.

GUANO ON SALE BY THE IMPORTERS, JOHN BOYD & Co., Wellington Chambers, London Bridge, Borough.

TO GARDENERS AND AGRICULTURISTS.

SUPER-PHOSPHATE of LIME is capable of producing a more rapid vegetation in Plants than any substance known. It may be had at Mr. LAWES' Factory, Deptford Creek, price 7s. per cwt.

Phosphate of	Potash	15s. per cwt.
,,	Soda	12s. ,,
,,	Magnesia	9s. ,,
,,	Ammonia	1s. per lb.

GENUINE PERUVIAN & BOLIVIAN GUANO ON SALE, BY THE IMPORTERS, ANTONY GIBBS AND SONS, LONDON; GIBBS, BRIGHT, AND CO., LIVERPOOL AND BRISTOL. 47, Lime-st., Jan. 5, 1844.

ON SALE, in any quantity, PERUVIAN and BOLIVIAN GUANO, genuine as imported,—Apply to COTESWORTH, POWELL, and PRYOR, London; EDWARDS, DANSON, and Co., Liverpool; or WILLIAM J. MYERS and Co., Liverpool, the Importers.

POTTER'S GUANO.—Sir Robert Peel, the Earl of Zetland, and others, have used POTTER'S MANURE with the greatest success on almost every kind of crop and soil. Testimonials may be obtained by application, per post, at the Works, 28, Upper Fore-street, Lambeth, or of any of Mr. POTTER'S agents.—See also the Advertisement in this Paper of the 6th Jan., containing some of the Testimonials referred to.

GUANO, PERUVIAN, &c.—The above Manures, also Potter's Guano, Nitrates of Soda and Potash, Gypsum, Bone-dust, and all other Chemical Manures of known value may be had of the undersigned, on the best terms, for cash.

Lists of Prices, with synopsis of mode of use, on applications to MARK FOTHERGILL, 40, Upper Thames-street, London.

THE URATE of the LONDON MANURE COMPANY, 5l. per Ton. It is with the greatest satisfaction, after three years' experience, the Company are enabled to recommend the above as one of the best manures for Barley, Oats, Spring Wheat, and more especially Turnips. By promoting a rapid growth of the latter it secures a full plant, at the same time producing a great weight per acre, and extending its beneficial effects to the succeeding crops. The Urate may be sown broadcast, or which is preferable, by the drill, at the rate of one ton to three acres, and it is desirable it should not be placed more than two inches below the surface. As a top-dressing for Wheat the Urate has been used with great advantage. Gardeners and Florists will find it very useful for Dahlias and other roots. Full particulars and Testimonials will be forwarded on application. Genuine Peruvian Guano; Phosphate and Sulphate of Ammonia; Gypsum and every other artificial Manure.

EDWARD PURSER, Secretary, 40, New Bridge Street.

LIQUID MANURE.

PUMPS of a Superior Construction, fixed and portable, for Liquid Manure. Garden Pumps, Hydraulic ditto, and Pumps for deep wells. Also Pumps for Ships, Barges, Tanners, Soap Boilers, Brewers, &c. Well-Digging and Boring executed. BENJAMIN FOWLER (late George Turner), 63, Dorset-street, Fleet-street.

GLASS SUPERSEDED for HORTICULTURAL PURPOSES by WHITNEY'S CHEMICAL TRANSPARENT WATERPROOF COMPOSITION, rendering Muslin, Calico, or Linen, for the Frames of Greenhouses, Pine, Melon, or Cucumber Stoves, &c., impervious to rain or moisture, admitting light equal to Glass, much warmer, and the plants never burn under it.

Noblemen, Gentlemen, and Gardeners will, by using this composition have the only effectual protection for their Fruit-trees during the blooming season; it is a certain defence from frost, sleet, wind, and blight; its transparency admits the general beams of the sun, with abundance of light, which causes the bloom to expand with increased luxuriance, the fruit to set and swell more freely, much earlier, and a crop of fruit to any extent may be warranted. The covering not to be moved by day (except to thin the Fruit, which will be necessary), till the month of June. It is recommended that the Calico be prepared early, so as to be thoroughly dry before using.

Sold in Bottles, with directions for use, pints, 2s. 6d., quarts, 4s. 6d. each. One pint is sufficient to coat four Frames twice over, each Frame to be 5ft. by 3ft. 3in., or thereabouts. Prepared by GEORGE WHITNEY, Chemist, Shrewsbury. Seedsmen, Florists, and Merchants supplied by Mr. W. BAILEY, Chemist, North-street, Wolverhampton. Appointed Agents:—Messrs. BUTLER and MUCKLEY, Covent Garden, where a sample of prepared calico may be seen; Mr. WATKINSON, Market-place, Manchester; PAGE and SON, Southampton; T. and C. WHALLEY, Nurserymen, Liverpool.

Agents wanted for London and the country.

BY HER MAJESTY'S ROYAL LETTERS PATENT.

PATENT ASPHALTE ROOFING.

THE above Material has been used and approved by the Nobility, Gentry, and Agriculturists generally, as a Roofing and Covering to sides of Farm Buildings; its advantages are—Lightness, Durability, and Economy. Being a non-conductor, it has been proved an efficient "Protective Material" to Plants, and is now in use at the "Royal Horticultural Society's Gardens, Chiswick." It can be had of any length, 32 inches wide, at 1d. per foot, super. A discount to the trade.

THOS. J. CROGGON, 8, Ingram-court, Fenchurch-st., London.

SUPERIOR SUBSTITUTE FOR TARPAULIN, &c.

C. MACINTOSH & Co. having made a considerable reduction in the price of the Patent India Rubber Covers for Carts, Waggons, Ricks, &c., beg to call the attention of Users of Tarpaulin and Oiled Sheets, to the superiority of their manufacture as an effectual protection against wet, not liable to crack on being folded, and more economical than any other Waterproof cover.—22, York-street, Manchester; and 46 Cheapside, London.

DRAINING.—JOHN DAVIS, Mathematical Instrument Maker, Derby, begs to direct the attention of Agriculturists to a very efficient and simple Level he has just constructed, adapted especially for Draining. The private Farmer or the professional Drainer will alike find in it all that is desired. The Instrument is fitted in a case, and sent to any part of the country—the price, 3l. 5s.

AUSTRALASIAN COLONIAL and GENERAL LIFE ASSURANCE and ANNUITY COMPANY, 126, Bishopsgate-street, Corner of Cornhill.

Capital £200,000, in 2000 Shares.

DIRECTORS.

E. Barnard, Esq., F.R.S.	Gideon Colquhoun, Esq.
Robert Brooks, Esq.	C. E. Mangles, Esq.
Henry Buckle, Esq.	Richard Onslow, Esq.
John Henry Capper, Esq.	William Walker, Esq.

BANKERS.—Union Bank of London.

COLONIAL BANKERS.—The Bank of Australasia (incorporated by Royal Charter, 1835), No. 2, Moorgate-street.

PHYSICIAN.—Patrick Fraser, Esq., M.D., No. 62, Guildford-st.

SECRETARY.—Edward Ryley, Esq.

ASSURANCES may be effected with this Company at unusually favourable rates, affording every variety of accommodation to the Assured. Participation in Profits, ascending and descending scales of premium, permission to retain one-third of the premium, which is charged as a debt against the policy, tables for the assurance of a sum payable in the event of death to the executors of the Assured, or to himself upon the attainment of the ages of 45, 50, or 60.

To EMIGRANTS to the AUSTRALASIAN COLONIES assured for the whole life, this Company offers the advantages of permission to proceed to, to reside in, and to return from those colonies without extra premium, and to pay their premiums there.

All questions relating to Assurance and Annuities, addressed to the Secretary, will receive immediate attention.

LONDON, EDINBURGH, and DUBLIN LIFE ASSURANCE COMPANY,

No. 3, Charlotte-row, Mansion House; and 55, Chancery-lane, London.

Trustees.

Auditors.

H. H. Cannan, Esq. | Robert E. Alison, Esq.

Medical Adviser.—Marshall Hall, M.D., F.R.S., L. and E.

Solicitors.—Messrs. Palmer, France, and Palmer.

THIS IS THE ONLY COMPANY who are bound by their deed of Constitution not to dispute any policy, unless they can prove that it was obtained by fraudulent misrepresentations; and numerous cases have shown how worthless may be a Policy obtained from the most influential office, which is unrestrained by this equitable principle, which removes all anxiety as to future dispute or litigation, and enhances immeasurably the value of the Policies as documents of security.

THIS IS THE ONLY COMPANY who give to the assured on the mutual principle the whole of the mutual accumulations, and also guarantee the sums assured.

THIS IS THE ONLY COMPANY who bind themselves to pay the sums in the Policies, although the debts for which they were effected shall have been liquidated before the claims arise.

THIS IS ALMOST THE ONLY COMPANY who grant in favour of creditors *whole-world Policies*, whereby the debt is secured, although the debtor should go beyond the limits of Europe.

The premiums, calculated according to the Carlisle tables, are lower than usual upon young lives, where participation in the profits is not required; and for short assurances, which at the option of the assured may be continued for life, the rates are as low as a due regard to complete security will permit.

Triennial Ascending Scale to assure £100.

Age	First 3 Years	Second 3 Years.	Third 3 Years.	Fourth 3 Years.	Remainder of Life.
25	£1 2 7	£1 9 9	£1 16 11	£2 4 1	£2 11 3
35	1 9 9	1 19 6	2 9 3	2 19 0	3 8 9
45	2 1 0	2 14 10	3 8 8	4 2 6	4 16 4
55	3 11 1	4 10 9	5 10 5	6 10 1	7 9 9
60	4 8 11	5 17 4	7 5 9	8 14 2	10 2 7

BY THE HALF-PREMIUM PLAN only one-half of the first seven years' premium is required, the other half being payable at the convenience of the assured; thus allowing a Policy to be continued for seven years, at one half of the usual rate, or to be dropped at one-half of the usual sacrifice; and entitling the assured, seven years hence, when loss of health may prevent him from effecting a new assurance, to continue a Policy at a rate of premium applicable to an age seven years younger.

Prospectuses and Schedules are forwarded to applicants, free of expense, by the manager and Agents.

ALEX. ROBERTSON, Manager.

ROWLAND'S MACASSAR OIL.—Patronised by Her Majesty, H.R.H. Prince Albert, the Royal Family, and the several Courts of Europe.—This elegant, fragrant, and pellucid Oil, in its preservative, restorative, and beautifying qualities is unequalled over the whole world. It preserves and reproduces the hair, even at a late period of life; prevents it from turning grey; or if so changed, restores it to its original colour; frees it from scurf and impurity, and renders it soft, silky, curly, and glossy, and retains its curl and other decorative form uninjured by the variations of the atmosphere or the effects of the crowded assembly—facts which are abundantly proved by the numerous testimonials which may be seen at the Proprietors'.

Its value is of course enhanced by being used at an early period of life, and to children it is especially recommended as forming the basis of a beautiful head of Hair. Price 3s. 6d., 7s., Family Bottles, (equal to four small), 10s. 6d., and double that size, 21s. per bottle.

CAUTION.—Each genuine bottle has the words "ROWLAND'S MACASSAR OIL," engraved in two lines, on the wrapper, and on the back of the wrapper nearly 1,500 times, containing 29,028 letters. Be sure to ask for "Rowland's Macassar Oil."

Sold by the Proprietors, A. ROWLAND and SON, 20, Hatton-garden, London, and by Chemists and Perfumers.

*** All others are spurious imitations!!!

BURBIDGE AND HEALY'S COOKING APPARATUS, combining Sylvester's Patents. This Cooking Apparatus is believed to possess greater general advantages than any yet submitted to the Public, both as regards strength of material and workmanship; in fact, the laws of heat are so applied as to produce the greatest effect with the least consumption of fuel, without destruction to the Apparatus; and B. and H. can safely recommend it from experience, as unquestionably superior to anything of the kind hitherto made. A Prospectus can be forwarded, upon application, detailing particulars and prices, to 130, Fleet-street.

A GENTLEMAN of liberal education, who has had many years' experience in England as well as on the Continent in every branch of the business of a Florist and Seedsman, wishes to meet with a gentleman willing to join him in commencing the above trade. To his knowledge the Advertiser can add an excellent connexion in town and country. None need apply who cannot command 1,000l. Address, post-paid, to M. A., Mr. GROOMBRIDGE, bookseller, Paternoster-row, London, stating real name and address.

A VACANCY for a MEDICAL APPRENTICE exists at a Public Institution, in one of our largest commercial cities. The advantages afforded are—residence in the family of one of the Medical Officers, with liberty to attend the regular course of study preparatory to examination, and ample opportunities for practice.—Apply at the Office of this Paper.

NEW FARMERS' NEWSPAPER.

THE time has come when Landlords and Tenants, large Farmers and small, must devote their anxious attention to improved cultivation—when, in the words of Sir Robert Peel, "*All must learn how, in the shortest time, and at the least expense, to produce the greatest quantity of food, vegetable or animal, without permanent injury to the land.*" To accomplish this, no means can be so effectual as that which brings the results of Experience and Science before every man, in a cheap form. For this purpose THE AGRICULTURAL GAZETTE is established.

The Proprietors are aware of the difficulties of dealing with the many details of cultivation without an acquaintance with circumstances, often as varying as places. They condemn the idea of conducting farming operations upon one invariable plan; and, while they welcome science as the best auxiliary of practice, they regard crude speculations as the most dangerous of delusions. But they also feel that in Agriculture, as in all other arts, there are general principles upon which successful farming must depend; that there are practical errors which no local circumstances can justify; in short, that there is room for improvement even in those branches which are best understood. No one man can be competent to deal with the multifarious questions affecting husbandry, and the duty of the Editor of such a Paper as THE AGRICULTURAL GAZETTE, is to make known the knowledge of all. It is to practical Farmers that the Proprietors trust for the means of carrying out their views, and not to the talents of any individual. While, therefore, they state that the Editor of THE AGRICULTURAL GAZETTE is a gentleman well acquainted with the best kind of Farming, in which he is actively engaged, they feel it to be of far more importance to announce the promise of assistance received from the landed and farming interest generally, especially of those whose names they are permitted to mention:—

The Right. Hon. the Earl Spencer, President of the Royal Agricultural Society of England.

The Right Hon. the Earl of Ducie, Vice-President of the Royal Agricultural Society of England

Mr. E. Beck, Rougham, Norfolk
&c. &c. &c.

The Practice of Agriculture—its Science—Animal and Vegetable Physiology—Improvements in Implements—better modes of Husbandry—results of well-conducted experimental Farming—Growth and Rotation of Crops—Stock—Drainage—Irrigation—Foresting—Road-making—Farm-Buildings—Labourers—in short, whatever affects the beneficial employment of capital in husbandry will form topics of consideration. Reports will be given of the English, Scotch, and Irish Agricultural Societies—London Market Prices of Corn, Hay, and Cattle, and the Weekly Averages. Replies to questions connected with the object of the Paper will also be furnished weekly.

Considering the union which exists between Horticulture and Agriculture, it has been thought advisable to make THE AGRICULTURAL GAZETTE an addition to the GARDENERS' CHRONICLE, edited by DR. LINDLEY, and so extensively known; but that there may be ample room for discussion, that Paper *has been increased one-half in size without additional charge*—thus Twenty-four Columns will be occupied, as at present, by Horticulture, and Twenty-four by the General News of the Week, whilst

Twenty-four Columns will be devoted to Agriculture.

This day, therefore, January 20th, is published, price SIXPENCE, stamped to go free by post, the THIRD NUMBER *of*

THE GARDENERS' CHRONICLE AND AGRICULTURAL GAZETTE:

A Weekly Record of Rural Economy and General News.

THE HORTICULTURAL PART EDITED BY PROFESSOR LINDLEY.

THE principle on which the Gardening part of this Paper is conducted is to make it a weekly record of everything that bears upon Horticulture, Floriculture, Arboriculture, or Garden Botany, and such Natural History as has a relation to Gardening, with Notices and Criticisms of all works on such subjects. Connected with this part are WEEKLY CALENDARS OF GARDENING OPERATIONS, given in detail, and adapted to the objects of persons in every station of life; so that the Cottager with a few rods of ground before his door, the Amateur who has only a greenhouse, and the Manager of extensive gardens, are alike informed of the routine of operations which the varying seasons render necessary. It moreover contains reports of Horticultural Exhibitions and Proceedings—Notices of Novelties and Improvements—in short, everything that can tend to advance the profession, benefit the condition of the workman, or conduce to the pleasure of his employer; accompanied with Woodcuts, whenever the matter treated of requires that mode of illustration.

To this Farming, as explained above, is now added.

Lastly, that description of domestic and political News is introduced which is usually found in a Weekly Newspaper. It is unnecessary to dwell on this head further than to say, that the Proprietors do not range themselves under the banners of any party; their earnest endeavours are to make THE GARDENERS' CHRONICLE a full and comprehensive *Record of Facts* only—a NEWSPAPER in the true sense of the word—leaving the reader to form his own opinions: their object being elucidation of the laws of Nature, not of man. The reader is thus furnished, IN ADDITION TO THE PECULIAR FEATURES OF THE JOURNAL, with such information concerning the events of the day as supersedes the necessity of his providing himself with any other Weekly Paper.

The Proprietors are happy to announce that the following distinguished Botanists, Florists, and Practical Gardeners have already enriched the GARDENERS' CHRONICLE by their communications:—

The Hon. and Very Rev. W. Herbert, Dean of Manchester
The Hon. and Rev. Charles Bathurst
Hon. W. Fox Strangways
Sir Oswald Mosley, Bart.
Sir W. J. Hooker, F.R.S., Royal Gardens, Kew
Dr. Harris
Dr. Horner, Hull
Dr. Lankester, F.L.S.
Dr. Neil, Canon Mills
Rev. J. M. Berkeley
Capt. Widdrington, F.R.S.
Professor Morren, Liege
A. Ainger, Esq.
G. Barker, Esq., Birmingham
E. Barnard, Esq., F.R.S.
J. Bateman, Esq., F.R.S., Knypersley
Mr. Mc Nab, Caledonian Society's Garden
Mr. Mearns, Botanic and Zoological Gardens, Leeds
Mr. Ingram, Gardener to Her Majesty
Mr. Paxton, Gardener to the Duke of Devonshire
Mr. Alexander, Gardener to the Duke of Leinster
Mr. Ferguson, Gardener to the Duke of Buckingham
Mr. Spenser, Gardener to the Marquis of Lansdowne
Mr. Elliott, Gardener to the Earl of Tyrconnell
Mr. Mills, Gardener to the Baroness Rothschild
Mr. Lauder, Gardener to Sir W. R. Boughton, Bart.

Hon. Algernon Herbert
Sir George Mackenzie, Bart., F.R.S.
Sir Charles Wolesey, Bart.
Captain Churchill, R.M.
Dr. Bevan, Llanferry
Dr. Gregory, Aberdeen
Dr. Ingram, President of Trinity College, Oxford
Dr. Winn, Truro
Rev. J. B. Reade
Professor Royle, F.R.S., King's College
Professor Graham, Edinburgh
C. Darwin, Esq.
G. Wailes, Esq., Secretary of the Hort. Soc., Newcastle
Mr. Marnock, Royal Botanic Society, London
Mr. Cameron, Royal Botanic Gardens, Birmingham
Mr. Patterson, Agent to the Duke of Hamilton

Mr. W. Billington, Oswestry
Mr. Campbell, Botanic Garden, Manchester
Mr. Williamson, Botanic Garden, Sheffield
Mr. Bailey, Gardener to the Archbishop of York
Mr. Mackintosh, Gardener to the Duke of Buccleuch
Mr. Moffat, Gardener to the Duke of Newcastle
Mr. Tillery, Gardener to the Duke of Portland
Mr. Cooper, Gardener to the Earl Fitzwilliam
Mr. Bowers, Gardener to the Earl of Lucan
Mr. Forsyth, Gardener to the Earl of Shrewsbury
Mr. Buchan, Gardener to Lord Bagot
Mr. Stuart, Gardener to Lord Denman
Mr. Beaton, Gardener to Sir W. Middleton, Bart.
Mr. Booth, Gardener to Sir C. Lemon, Bart.
Mr. Whiting, Gardener to H. T. Hope, Esq., M.P.
Mr. W. P. Ayres, Brooklands
Mr. James Drummond, Gardener, Blair Drummond
Mr. Gordon, Hardy Dept., Horticultural Gardens, Chiswick.
Mr. Wells, Gardener to W. Wells, Esq., Redleaf

OFFICE FOR ADVERTISEMENTS AND COMMUNICATIONS, 5, CHARLES-STREET, COVENT-GARDEN, LONDON.

Orders received by all Booksellers and Newsvenders.

Printed by Messrs. BRADBURY and EVANS, Lombard-street, Fleet-street, in the Precinct of Whitefriars, in the City of London, and Published by them at the OFFICE, 5, CHARLES-STREET, COVENT GARDEN, in the County of Middlesex, where all Advertisements and Communications are to be addressed to the Editor.—Saturday, January 20, 1844.

The Newspaper.

SATURDAY, JANUARY 20, 1844.

TWENTY YEARS' LOSS OF HAIR and WONDERFUL RESTORATION. Church-street, Whitby, Oct. 19, 1841.—Gentlemen—Of the last supply of OLDRIDGE'S BALM OF COLUMBIA every bottle was sold immediately on receipt, and I have had many more bespoke, only waiting for a further supply, which I hope you will send without the least delay. Orders have poured in more than ever since the powerful effects of the Balm have been so satisfactorily demonstrated in the cases of several credible and respectable inhabitants of the town. One instance, among others, has attracted particular attention, is the case of a gentleman who had had little or no hair for twenty years: he had tried numerous preparations in vain, and ultimately had his head shaved and wore a wig. At my recommendation he tried the Balm, and after using it according to the directions for a short time, the young hair appeared, and he has now as fine a head of hair as any person in Whitby.

Yours, &c., JOHN KILVINTON.

To Messrs. Kennaby, Brothers, 10, Westmoreland-buildings, Aldersgate-street, London.

OLDRIDGE'S BALM prevents the hair turning grey, produces a beautiful curl, frees it from scurf, and stops it from falling off; a few Bottles generally restore it again. Price 3*s.* 6*d.*, 6*s.*, and 11*s.* per Bottle. *No other prices are genuine.* Ask for OLDRIDGE'S BALM of COLUMBIA, 1, Wellington-street, Strand.

BETTS'S PATENT BRANDY.—DISTILLERY, No. 7, SMITHFIELD BARS.—Notwithstanding the publicity for many years past given to the superiority of BETTS'S PATENT FRENCH DISTILLED BRANDY over every other Spirit, British or Foreign, it is yet but partially known: J. T. BETTS and Co. therefore feel it a duty they owe to the Public and themselves, to invite a comparison between the Patent and the French Brandy, until every Family in the kingdom, in which Brandy is consumed, have made trial of their Patent Brandy,—and, consequently, discontinued the use of the Foreign article. Their respective merits are fairly developed in the following Testimonials, to which they again beg to refer:—

EXTRACTS FROM TESTIMONIALS.

"I do not hesitate to express my conviction that your Patent Brandy is fully as free from everything injurious to health, and contains as pure a spirit as the best varieties of Foreign Brandy. EDWARD TURNER, Professor of Chemistry in the University of London. "John T. Betts, Esq."

"I am bound to say, and do assert it with confidence, that, for purity of spirit, this cannot be surpassed; and that your Patent Brandy is also quite free from those acids which, though minute in quantity, always contaminate the Foreign Spirit. JOSEPH HOME, Chemist to His Majesty. "J. T. Betts, Esq."

"Your Brandy is free from uncombined acid and astringent matter, which exists, more or less, in most of the Brandies imported from France. JOHN THOMAS COOPER, Lecturer on Chemistry. "To Mr. Betts."

It is this perfect freedom from the above objectionable qualities, and its agreeable similarity in flavour to the finest samples of Cognac Brandy, that constitute the peculiar value of the PATENT BRANDY.

J. T. BETTS and Co. are, at length, enabled to give a distinct assurance that arrangements will be completed in the course of the present month, which will afford an unfailing protection to purchasers against the continuance of those frauds, from which they have hitherto so extensively suffered; as each bottle will be secured by a PATENT METALLIC CAPSULE, or covering for the cork, of solid metal, with their name, address, and the words "BETTS'S PATENT BRANDY" embossed upon it; the forgery of which subjects the guilty party to a Penalty of Fifty Pounds for every offence.

This valuable Spirit is manufactured only at the Distillery, No. 7, Smithfield Bars, leading to St. John-street; where it may be obtained, either pale or coloured, in quantities not less than Two Gallons, at 18*s.* per Gallon, for Cash, on delivery.

Each volume complete in itself.

CONTENTS of the SECOND NUMBER for 1844 OF

THE ATHENÆUM,

JOURNAL OF ENGLISH AND FOREIGN LITERATURE, SCIENCE, AND ART.

Twenty-four Large Quarto Pages, PRICE FOURPENCE,

Or Stamped, to go free by post, 5*d.*

REVIEWS OF, WITH EXTRACTS FROM—

Errors in Irish Populat Census.
Captain Gully and Mr. Denham's Journal during their Captivity in China, in 1842
The Comic Album.
Major Harris's Highlands of Æthiopia
Buckingham's Memoirs of Mary Stuart
Dramas and Tragedies:—The Robber's Cave—Martelli—Mr. Thomas's Thereza—Mr. Powell's Blind Wife—Mr. Smibert's Condé's Wife—Mr. Reithmüller's Launcelot of the Lake—The Brothers—Mr. Peter's Maid of Orleans—Catherine Douglas.

ORIGINAL PAPERS.—FOREIGN CORRESPONDENCE.—Letter from Cairo.
" " MRS. JAMESON'S MEMORIALS of ALLSTON, the American Painter.
"OUR WEEKLY GOSSIP"—On the Railway Reform Association—The New Ray Club—Statue to M. de Dombasle, the founder of the Model Farm at Roville; and other French Monuments—Dinner to Mr. Fillan, the Sculptor—Establishment of Public Baths—Niccolini's Arnoldo da Brescia, &c. &c.
REPORTS of GEOLOGICAL SOCIETY (Mr. Charlesworth on the genus Pinseter in Red Crag at Felixstow—Mr. Beckett on a Fossil Forest near Wolverhampton—Dr. Ick and Mr. Dawes on Remains of Fossil Trees—The Rev. Mr. Williams on the Trap Rock of Bleadon Hill)—GEOGRAPHICAL SOCIETY (Mr. Johnston's Account of the Island of Hong Kong)—ASIATIC SOCIETY—INSTITUTION OF CIVIL ENGINEERS (Mr. Storey on Iron Bridges—Captain Moorson on Cast-Iron Bridge over Avon—Mr. Hemans on a Wrought-Iron Lattice Bridge)—INSTITUTE OF BRITISH ARCHITECTS (Mr. Higgins on the Restoration of the Spire of St. Stephen, at Vienna)—SOCIETY OF ARTS (On the Means of Cleansing, daily, the Streets of the Metropolis—Mr. Prosser on Wooden Railways as Feeders to the present Lines).
FINE ARTS—Chantrey's Equestrian Statue of George the Fourth.
MISCELLANEA—Paris Academy of Sciences (on the Temperature Natural to Man)—National Gallery—Chateaubriand—Lord Rosse's Telescope—New Buttons.

CURIOSITIES AND IMPROVEMENTS FOR 1844. EXHIBITED opposite Day and Martin's, 247, High Holborn.—Go everywhere and persuade them to examine, that they be no longer a stiff-necked, crippled, or ignorant people.—By HER MAJESTY'S Royal Letters Patent, and under the especial patronage of H.R.H. PRINCE ALBERT.

AT the ROYAL POLYTECHNIC INSTITUTION an increase of POWERFUL and BRILLIANT EFFECTS in ELECTRICITY are exhibited by ARMSTRONG'S HYDRO-ELECTRIC MACHINE. A new field is open for investigating, on a magnificent scale, a variety of objects of Art, Science, and Natural History, by means of Longbottom's Opaque Microscope, showing also an extraordinary Optical Illusion. New Dissolving Views. A List of the Popular Lectures which will be delivered during the week is suspended in the Hall of Manufactures. Holloway's Original Crayon Drawings from Raphael's Cartoons, numerous Models in Motion, Diver and Diving Bell. Conductor of the Band, T. WALLIS, Mus. Doc. Admission 1*s.* Schools half-price.

PIANO FORTES.—LUFF AND CO.'s Boudoir or Piccolo Piano Forte, 25*l.*; Cottage, 27*l.*, Package and use of Case included. For tone, touch, durability, and cheapness, these Piano Fortes are unequalled. Warranted to keep well in tune, and prepared for extreme climates. L. and Co.'s Patent Piano Fortes equally cheap. Two new Patent Semi-Grands just returned from Hire, very cheap.—LUFF AND CO., 103, Great Russell-street, Bloomsbury.

News of the Week.

THE State trials in Ireland, after another unsuccessful attempt on the part of the traversers to obtain a postponement to the 1st of February, commenced with the usual formalities on Monday. On that day the jury list had been arranged, and the gentlemen who were selected to form the jury of 12 were about to be impanelled, when the counsel for Mr. O'Connell put in a challenge to the whole panel, on the ground of the omitted names in the Recorder's list. This step appears to have been wholly unexpected on the part of the Crown, and after considerable delay the Attorney-General demurred to the challenge, and argued at great length against its validity. The whole day was consumed in arguments on the question, and at length the Court, with the exception of Mr. Justice Perrin, decided that the challenge was bad, and that the demurrer of the Attorney-General must be allowed. On Tuesday another delay occurred in consequence of the absence of two of the traversers, whose counsel argued that there was no absolute necessity for them to appear in person. The Attorney-General insisted on their appearance, and the Chief Justice having ordered them to be called on their recognizances, they immediately came into Court. The Jury were then sworn, and the Attorney-General commenced his address. After speaking for five hours it was agreed that an adjournment should take place, as the mere statement of the case would necessarily occupy another day; and by agreement of both sides the Jury were allowed to return to their homes. On Wednesday, the Attorney-General resumed and concluded his speech, which occupied the entire sitting of six hours. It comprised a minute account of the Repeal meetings, of the proceedings of the Repeal Association, of Mr. O'Connell's proclamations, of the articles published in the Repeal journals, and of various other topics which will be found enumerated in our account of the trials, to which we must refer our readers for the details. On Thursday the examination of witnesses commenced. Mr. Bond Hughes, the Government Reporter, was the first witness called, and nearly the whole day was occupied with his examination. The chief purpose of his evidence was to prove the speeches delivered by the traversers at the different meetings, and to identify the speakers.

From France we have the particulars of the debate on the Address in the Chamber of Deputies. The passage denouncing the late demonstrations of the Legitimists in London has been the principal subject of discussion. M. Berryer and other Royalist Deputies protested against the terms applied to them in the Address, and declared that their visit to London was not the result of any criminal design. These statements however appear to have had little influence on the Chamber, and there is no doubt that the paragraph will be carried without modification. The Right of Search will be the next subject of discussion, and an animated debate is expected on the present relations between France and England.—The news from Spain announces that the Opposition have succeeded in obtaining a majority in the electoral colleges of Madrid, and that the fortress of Figueras has at length surrendered to the Queen's troops.—In Canada numerous addresses have been presented to the Governor-General, approving of his late proceedings in regard to the Executive Council; while in Nova Scotia Lord Falkland has been deserted by several Members of his Council for reasons precisely similar to those which led to the late resignations in the Council of Canada.—The accounts from the United States relate chiefly to a discussion on Slavery, and to the introduction of a bill respecting the Oregon territory, which was referred to a select committee.

Home News.

COURT.—Her Majesty, Prince Albert, the Prince of Wales, and the Princess Royal, returned to Windsor Castle from Claremont on Tuesday. During the stay at Claremont the Prince went out shooting daily in the preserves, and Her Majesty took her usual exercise in the park. It is said that an addition to the Royal family may be expected in the course of the summer. Since Her Majesty's return to Windsor the following visitors have arrived at the Castle:—the Earl and Countess of Jersey, Lady Clementina Villiers, Sir Robert and Lady Peel, the Duke and Duchess of Buckingham, and Sir H. Wheatley. The Viscountess Canning has succeeded the Marchioness of Douro as the Lady in Waiting, the Earl of Warwick has succeeded Lord Rivers as the Lord in Waiting, and Captain Meynell has succeeded the Hon. Captain Duncombe as the Groom in Waiting on Her Majesty.—The Duchess of Cambridge arrived at Kew on Tuesday from the Continent, accompanied by the Princess Mary.

The Duc de Bordeaux left England suddenly for the Continent on Friday night. After the visit of his Royal Highness to Woolwich and Chatham he was about to continue his tour, when letters reached him from Germany, announcing the severe indisposition of the Duc d'Angoulême. His Royal Highness immediately decided upon abandoning his tour in England, and embarked on Friday evening for Ostend, on his way to Goritz.

Death of the Marquess of Hastings.—We regret to state that Lord Hastings died on Saturday evening at Southampton, where his Lordship had arrived last week from Bournemouth for medical advice. His Lordship had been residing for a short time on the Hampshire coast for change of air, and his health had latterly been getting so seriously affected that it was thought advisable to remove to Southampton. His Lordship is succeeded in the title by his son, born in 1832.

The Colonies.—The Ministerial papers announce that Mr. Davis, who formerly acted for a short time as successor to the late Lord Napier in China, has been selected by Government to relieve Sir H. Pottinger as the Queen's Representative and Governor of the new British colony, Hong Kong. Mr. Davis will depart very shortly on his mission by the overland route.

The Cabinet.—Cabinet Councils were held on Saturday, on Monday, and on Tuesday, which were attended by all the Ministers. After the Council on Tuesday, Sir R. Peel took his departure for Windsor Castle. The right hon. Baronet has issued cards for a Parliamentary dinner on Wednesday the 31st inst., at which he will read the Royal Speech on opening Parliament. It is understood that in the House of Commons, Viscount Clive, member for North Shropshire, will move the address in answer to her Majesty's Speech; and Mr. Cardwell, Member for Clitheroe, will be the seconder.

The Navy.—Sir J. C. White, K.C.B., Vice Admiral of the White, has been appointed Commander-in-Chief at the Nore, in the room of Admiral Brace deceased; and Admiral Sir J. H. Whitshed, Bart., G.C.B., has been appointed Admiral of the Fleet, in the room of the late Sir C. E. Nugent.

Foreign.

FRANCE.—The debate on the address in the Chamber of Deputies commenced on Monday. The draft of the address as prepared by the committee is for the most part an echo of the King's speech, except as regards the allusion to England and to the Legitimists. With respect to this country, instead of the term "cordial understanding" of the speech when speaking of the relations with England, the address speaks only of the intimate friendship between his Majesty and the Queen of Great Britain, which the Chamber of Deputies "is glad to hear of," and the "accord of sentiments" between his Majesty's Government and that of Great Britain—not generally, but with respect to "the late events in Spain and Greece" alone. With regard to the Legitimists a strong allusion is made, but even that is not as strong as the Ministry would have wished it. It was considerably stronger in the original draft, and it was only at the last meeting of the committee that at the urgent solicitation of M. Ducos, one of the Opposition members of the committee, the phrase was modified as follows:—"Sire—your family is truly national. Between France and you the alliance is indissoluble. Your oaths and ours have cemented that union. The rights of your dynasty remain placed under the imperishable guarantee of the independence and loyalty of the nation. The public conscience brands guilty machinations. Our revolution of July, by punishing the violence of sworn faith, has consecrated with us the sanctity of oaths." On Monday, after some preliminary proceedings of no interest, the debate on the address commenced, and M. Berryer rose amidst profound silence. He said that he wished to speak first, because neither he nor several other Members would remain a moment in the Chamber during that discussion, in the position one of the paragraphs of the address had placed them in. The Chamber were called upon to apply to them the epithet "branded" and "guilty." What more could there be said to criminals? If guilty he wondered that he and his friends had not been brought to justice. The Chamber had been more generous to him in 1832. They demanded that the penalty of death be inflicted on him. When he and his friends had entered that hall was it fancied that they had renounced all candour and sincerity? Was there even on the contrary a more honest and sincere minority? Their loyalty for 13 years past had been what their constituents desired, and they had spoken their sentiments. What was it that had passed since 1830? Had there been but a change of persons? Had there been no change of principles? He would not enter upon a discussion with those men who had acknowledged every fact and every Government. He would discuss with men of principle. The principle proclaimed in 1830 was that of national sovereignty; from that principle many others had flowed. He and his friends had submitted to the laws of their country, and admitted the principle thus proclaimed. Their language had conformed to it because they had thought that that principle permitted them to retain their convictions. If they had thought their presence in that Chamber entailed a desertion of all their affections and convictions they would have blushed to stay in it one moment. In revolutionary times vanquished minorities

were apt to seek to recover th ir ascendancy by violence. Their task had been to repress all violence and civil war, clamour and slaughter. They should not disdainfully repel the efforts thus made. Those efforts have been efficient. Even a conquered enemy should not be disdained. Nothing criminal had taken place in the journey to London. They who went there had obeyed old affections ; they had gone to do homage to the heir to that long line of kings which had reigned over the country and made its geographical map. They had gone to do homage to the old glory of France.—M. Dupin—We have just inaugurated Molière.—M. Berryer, after a few words more which were interrupted by loud cries of order, sat down, saying that he could not speak amidst such derisive interruption, and that he would oppose but his indifference to such censure.—M. Guizot expressed regret that M. Berryer had not completed his justification, not finding that he was much interrupted.—M. Berryer then ascended the tribune again and resumed his speech ; reiterated that nothing had taken place or been uttered in Belgrave-square contrary to their rights. He and his colleagues would therefore demand no modification of the address, but remain in the Chamber so long as their constituents wished.—M. Guizot in reply inveighed against what had passed in Belgrave-square. The country he said made itself no illusion to the designs of the Legitimists, but was calm and quiet because it was assured of their impotency.—M. Berryer returned to the tribune and replied to M. Guizot.—M. Dupin followed and spoke most bitterly against the party which he said had been conquered at Valmy, and had availed itself of the defeat of Waterloo, which he added was its opprobrium.—The Duke de Valmy replied to M. Dupin, and M. Bethmont of the Opposition spoke after.—M. de Larcy the Legitimist Deputy then addressed the Chamber, and roused great tumult by upholding his attachment to the Duc de Bordeaux. The Marquis de la Rochequelein followed on the same side.—The general debate was brought to a conclusion on Tuesday, and the debate on the different paragraphs commenced on Wednesday. The debate on Tuesday was animated and interesting, the great event of the day being the speech of M. Thiers, who, after a silence of upwards of two years, reappeared as a speaker upon this occasion. He began by regretting that he had reserved for the present Ministry one half of the vivacity with which he attacked the Cabinet of the 15th of April—the Molé administration. The Cabinet of the 15th of April had been accused of exposing the Throne, but it had not done so as much as the present Cabinet. Notwithstanding the support the Cabinet received from the left side of the house, it was so weak that it did not govern—it merely existed, and the very condition of that existence was the absence of Government. For as the Ministry had refused to make concessions to those from the opposite side who would support it, it was now obliged to stand still and depend upon its narrow majority. The consequence was that the plans of Government were continually altered, delayed, or defeated. In measures brought forward by the Government they had failed ; measures which they did not wish to have passed were forced upon them ; and the inference he drew was that the Government was too weak to govern the country. As an instance, he cited the Right of Search. They were told that negotiations were going on, but in England it was openly stated that these negotiations were to come to nothing, and for his own part he had no doubt that the next King's speech would announce that the negotiations were still pending. He then alluded to the dotation question, and gave it as his opinion that the conduct and weakness of the Government on that question had compromised Royalty ; and he summed up all by saying that the Ministry though just able to exist was weak and impotent both as regarded the country and the throne.—M. Duchatel Minister of the Interior replied, and instead of defending the Ministry rather carried the war into the enemy's camp. He taunted M. Thiers with having had an opportunity of putting his theories into practice, but he would ask what had he produced? With regard to the reproach thrown out by M. Thiers that the policy of the present Government was not sufficiently elevated he would only say that though they did not pretend to realise every possible good, they maintained and acted on the principle of honest men, doing the best they could for the grand interests of the country. He denied that the Ministry were opposed to conciliation or improvements where practicable ; on the contrary, they were anxious for them ; but that was very different from adopting imaginary reforms which tended rather to impede than to advance the progress of the country. He then defended the different measures of the Government which had been attacked, and said that though it might be very well for M. Thiers and others in opposition to recommend to the Ministry to bring forward the dotation and other measures which would probably be rejected by the Chamber the advice was not at all so palatable to the members.—M. Thiers said a few words in reply in which he defended his foreign policy and said that his Ministry were no more guilty of exciting an European war than the Ministry themselves of exciting a civil war by the census. He was proceeding with further remarks but the impatience of the house prevented him.—Two other speeches were made but they require no particular remark : the one by M. Gustave de Beaumont in which he attacked the general policy of the Government, and the other by M. Desmousseaux de Givre. The general debate then closed.—On Wednesday the debate was resumed by the first paragraph of the address being read, when M. Ducos spoke. The Commerce-Minister, he said, admitted the great depression of the shipping interest, which strangely contradicted the expression of the address that "commerce was taking a rapid flight."—The Commerce-Minister denied the assertion of M. Ducos altogether and brought forward a quantity of figures to prove French commerce in a satisfactory way of progression.—The next debate of any importance will be on the foreign policy of the Government, when the Right of Search will of course be the principal subject for attack. M. Billault as well as M. Thiers will take the principal share in the discussion. —The Duc de Fitzjames has addressed a letter to M. Guizot in reference to the speech pronounced by that Minister against the late demonstrations in Belgrave-square. The royalist duke is deeply hurt at the expression "scandalous" used by M. Guizot in his speech in the Chamber of Peers when speaking of the addresses presented to "Henry of France," and in this letter not only makes a violent attack upon the minister, but throws out a sort of defiance to the Government of July. "If," he says, "I have violated the laws of my country, why do you not bring me before its tribunals? It is yet time to do so. Dare to do it. I am ready. Send me before twelve French jurymen and there I will explain myself. There, in the presence perhaps of a condemnation, my voice will not become enfeebled, and I will repeat in the face of my country the words which I pronounced in Belgrave-square. Your imprudent threats cannot frighten me. I have done as honour directed me. You will not make me draw back. Sir, you will not make me bow to that to which I do not wish to bow. You will not make me respect that which I cannot respect. If you know the history of my family you may know that it is only the axe of the executioner that can force us to bow the head."—M. Lafontaine, the Legitimist judge of Lille, who had been brought up for having paid a visit to the Duc de Bordeaux, was tried on Saturday before the Court of Cassation. The trial was with closed doors. M. Lafontaine wished it to be public, but his appeal to that effect was overruled by the court. The particulars are not known, but after a hearing of six hours M. Lafontaine was found guilty. His sentence was merely to be censured and reprimanded, which having been done M. Lafontaine was discharged.—The Editor of the *Gazette de France* was on Tuesday tried for articles published in that paper advocating indirectly the right of the Duc de Bordeaux to the throne of France, and being convicted, was sentenced to two years' imprisonment and a fine of 6,000 francs. The Editor of the *Quotidienne* was then tried for a similar offence, and being convicted was sentenced to one year's imprisonment and a fine of 8,000 francs. Upon these prosecutions the Opposition press comment with much bitterness.—On Wednesday the deputation of the Chamber of Peers presented the Address to the King, who alluded in his reply to the late royalist demonstrations. "At home," said his Majesty, "the empire of the laws is well established, factions are put down and the vain demonstrations which they can make will only serve to prove their impotence. My family and myself are altogether at the service of France, and she will always find us ready to surmount our own troubles and griefs to listen only to the voice of our country, whenever we may be able to serve her."—The Budget for the current financial year has just been presented. It exhibits a balance between the receipts and the expenditure. The Budget of 1844 presented a year since contained a demand for the ordinary service of 1,281,013,710f., to meet which there was only a revenue of 1,247 228,366f., which left a deficiency of 33,785,344f. The ordinary Budget for 1845 requires an expenditure of 1,276,106,797f., and a revenue of 1,276,925,231f. The surplus of revenue over the expenditure is consequently nearly 1,000,000f. On the revenues of 1843 as compared with those of 1841 there is an increase of 48,900,000f., and of 13,316,000f. over 1842. The improvement bears principally on the registry duties, stamps, customs, colonial sugars, salt, liquors, carriage-licenses, tobacco, &c. ; the decrease on domestic sugars, gun-powder, &c. The augmentation in the customs is 13,799,000f. as compared with 1841, and 4,318,000f. with 1842. —The inauguration of the statue of Molière took place on Monday in the presence of a large concourse of spectators, but in consequence of the extraordinary precautions taken by the Government no disturbance of any kind occurred.—According to a calculation in the *Patrie* the cost to France of the conquest and occupation of Algeria amounts to 670 millions of francs. On the other hand the Government has received—1st, the treasure taken at Algiers and the treasure of the matériel, estimated together at 54,737,000f. ; and 2d, in revenue from 1831 to 1843, a sum of 46,000,000f.—making the total loss hitherto sustained 569,263,000f.—The 64th list of the subscriptions paid into the central committee of the Guadaloupe relief fund has just been published. The total amount subscribed up to last week is 3,449,046f.—The French press in 1843 brought forth 6176 works in all the languages, dead and living ; 1879 engravings and lithographic prints ; 147 maps, plans, and charts ; and 316 pieces of music have also been published.—The Champagne wine-merchants met at the Hotel de Ville of Rheims on the 27th to adopt measures for preventing the imitation of Champagne which every year is increasing. It was decided—1, that a committee should be formed to watch over the interests of the wine-merchants ; 2, that this committee should enter into communication with other committees ; and 3, that a subscription should be raised to defray the expenses.—A letter from Saint-Pierre, Martinique, dated Nov. 25, states that the yellow fever was raging there and had caused a great number of deaths, principally among the crews of the French vessels lying in the harbour.—The *Presse* repeats the statement that the English have taken possession of Diego Suarez in the island of Madagascar.

SPAIN.—We have accounts from Madrid of the 9th inst. The Progresista or Exaltado party had prevailed in the preliminary operations of the Electoral Colleges of Madrid. They had obtained seven *bureaux*, and the Moderado or Ministerial party only four. The two consisted of Progresistas or Moderados, and the triumph of the former was considered certain. The two Envoys sent to Paris with a message to Queen Christina had just returned, and had a long conference with the President of the Council, nothing of which had as yet transpired. General Narvaez had just resigned the rank of Captain-General, to which he had been recently raised. In his letter to the Minister of War on the subject, he says that he relinquishes the high distinction thus conferred on him as a reward for his services to the country, and a compensation for the sufferings, persecutions, and unjust rivalry he has endured, "in order not to afford the slightest pretext for his conduct being imputed to ambition, or any other still less noble motive. The Journals publish the report, signed by all the Ministers, which precedes the Royal decree restoring to Maria Christina the pension of which she was deprived by Espartero's decree of the 26th of October, 1841. The report pronounces the ex-Regent's measure illegal, and adds that it would moreover be improper to forget any longer the Princess who governed the country with "so much glory, generosity and nobleness" during the disturbances of the Queen's minority. Mr. Bulwer had presented an autograph letter from Queen Victoria to Queen Isabella, in reply to the notification made to her British Majesty of the Queen of Spain's majority. The Supreme Tribunal of Justice had been commissioned to decide whether being a Knight of the Golden Fleece and Charles III., M. Olozaga had not infringed the statutes of those orders by leaving Spain without a passport.—The fort of Figueras has surrendered to the armies of the Queen. In the morning of the 11th inst. the capitulation ratified by the Government was definitively signed by the Captain-General and Ametler. On the 12th the fort was occupied by the Queen's troops. Most of the officers of Ametler took passports for France.

PORTUGAL.—The news from Lisbon is not of much importance. The business of the new session commenced in the Chamber of Peers on the 3d inst. with the presentation of 25 petitions against the new project of a law proposing to vest the administration of the charitable institutions of the country in the hands of Government. In the Chamber of Deputies, Senhor Silva Sanches moved on the 5th for copies of all notes and other official papers relative to the proposed treaty of commerce with Great Britain. The Minister of the Interior said he approved of the motion for these papers, "provided always there was no inconvenience from their production."

GERMANY.—Letters from Vienna in the French papers mention the death of the Duc d'Angouleme, uncle of the Duc de Bordeaux, at Goritz, but, though seriously ill, the death of his Royal Highness is not confirmed.—Accounts from Hanover state that the Minister of the Interior had published an ordinance imposing upon the owners of circulating libraries and literary circles an obligation to send their books to be censured anew, whether they had been already authorized or not by the authorities. The journals received in those establishments are likewise to undergo the censorship, and hereafter no person who does not enjoy general confidence shall be allowed to keep a circulating library or a literary circle in Hanover.—Letters from Berlin state that the King of Prussia has commissioned Meyerbeer to compose an opera for the opening of the Royal Opera at Berlin, which is to take place on the 15th October next. They also state that the capital is about to be enriched with a new cathedral, the designs for which have been executed by the famous Prussian architect M. Stieler, after the suggestions of the King himself. It will be in the Italian style, and is to be one of the finest in Germany. The most celebrated artists of all countries will be employed to embellish it with sculpture and painting. The vaults will be appropriated as a burial-place of the reigning family of Prussia. The estimate of the expense amounts to thirty-eight million francs. — From Vienna we learn that the Emperor has decided that the railway from Vienna to Trieste shall be connected with that between Milan and Vienna. The new railway will pass by Goritz, and have a branch to Palmanuova.—Letters from Carlsruhe of Jan. 1, state that the Princess Augusta of Nassau whose birthday occurred two days before, and who was in good health when she rose, was suddenly taken ill and so seriously that she could not receive the usual compliments on the occasion. A paralytic stroke has deprived her of the use of her speech and fears are entertained for her life. The princess is married to Count Von Brismark the Ambassador of Wirtemberg.

BELGIUM.—Letters from Brussels state that the Duke of Bordeaux passed through Belgium on Sunday. He had arrived the previous night at Ostend by the Earl of Liverpool steamer. His *suite* consisted of four persons only, among whom was the Duc de Levis. The Duke slept at the Hotel des Bains at Ostend, and went thence direct to Cologne by the railroad without visiting Brussels. It is understood the illness of the Duke of Angouleme was the cause of his hurried journey.

HOLLAND.—Letters from Amsterdam describe that city as in a state of excitement on account of the proposition of a property-tax by the Finance Minister. The greatest hostility is shown to the measure, and not one journal had, it seems, undertaken its defence. Count Van der Bosch, Minister for the Colonies under William I., and now member of the Second Chamber of the States-General, has taken a prominent part in the opposition, and has published a pamphlet on the subject.—On the 9th instant, the hotel of the Minister of Marine at the Hague was almost entirely destroyed by fire. More than half of that fine building, containing all the Navy offices, was consumed. The King and Princes were present, and took an active part in the exertions to subdue the flames.

ITALY.—The Toulon papers announce that the rupture between Sardinia and the Bey of Tunis was not so immiment as was represented by the Paris journals and that the Sardinian flag was still hoisted at Tunis.—*La Reforme* states that whilst all European nations are labouring to facilitate communication by means of letters, there are two countries—Switzerland and the Roman states—which have raised the rate of postage.—On Christmas-eve the Neapolitan fleet which conveyed the Empress of Brazil to Rio de Janeiro returned in good condition to Naples, having enjoyed the finest weather during the voyage. The return of the fleet excited great interest among the inhabitants on the sea-shore and added to the gaiety of the Christmas festivities. The Count de Aquila immediately after his arrival went to visit his Royal brother at Caserta. The voyage out occupied 85 days and the passage home was performed in 65 days.—The Signora Favante who has astonished the Neapolitans by her extraordinary compass of voice, which ranges from G below the lines to D above, is no other than Miss Edwards, a pupil of Crevelli and lately a student at the Royal Academy of Music, who used to sing at the concerts given by that institution.

UNITED STATES AND CANADA.—The mail steam-ship Hibernia arrived at Liverpool on Saturday. She left Boston on the 1st, and Halifax on the 3d inst., and made the passage, including a detention of several hours at Halifax, in 12 days. In Congress on the 26th ult. Mr. Adams offered a petition praying that slavery and the slave trade be abolished in the district of Columbia; that no new slave state be admitted into the union; that the petitioners be for ever separated from slavery; and Hayti be recognised, &c. The Speaker said it was excluded by the 21st rule. Mr. Adams did not think the whole was excluded, but the Speaker decided that the petition could not be divided and a part received. He excluded the whole. Mr. Adams appealed. The House sustained the decision of the Speaker by 105 to 40. The select committee on rules afterwards agreed to report a resolution rescinding the 21st rule, and it is stated that there is little doubt of the success of the motion in the house. A select committee on the resolutions of the Legislature of the State of Massachusetts in favour of abolishing slave representation was formed on the 27th ult. On the same day in the Senate, Mr. Atchinson introduced a bill to establish a territorial government near the territory of Oregon, which was referred to a select committee. —Lord Falkland in Nova Scotia, like Sir Charles Metcalfe in Canada, has been deserted by several members of the Executive Council, and the reasons offered for the resignations are alike similar. The members who retire are Mr. Joseph Howe, Mr. J. B. Uniake, and Mr. J. M'Nab; the grounds of complaint are that his Excellency has decided upon appointing Mr. Almon to a seat in the Council, a circumstance they state indicating a change of policy of which they cannot approve. Lord Falkland in a long letter denies any intention of altering the course of policy he has hitherto pursued, and intimates that their resignations are the consequence of his not having placed the appointment entirely in their hands.—The *Toronto Patriot* mentions a rumour that a large number of the Reform members of Western Canada who voted with Mr. Baldwin on the recent division, met together in Kingston just as Parliament was prorogued, and sent a memorandum to the Governor-General signifying their willingness to support any council to be formed by Mr. Harrison. Addresses were pouring in from all parts of the province approving of the stand taken by his Excellency the Governor-General, and expressing a firm determination to support him. A Royal pardon has been extended to the five following transported prisoners who are undergoing their sentence in New South Wales in consequence of the part taken by them in the late rebellion in Canada:—Pierre Hector Morin, Achille Morin, Charles Huot, Louis Pinsonnault, Rene Pinsonnault.—There has been more rioting among the canal labourers. Many of the men along the line have refused to work at the reduced prices offered by the contractors and have been idle for some time past; their funds are running low and they are becoming desperate, and it is feared that much trouble and suffering will be the consequence during the inclement season of the year.

NEW SOUTH WALES.—Accounts from Hobart Town and Launceston to the 9th Sept. have been received. Sir Eardley Wilmot arrived on the 20th August and had taken the reins of Government, but the conduct of Sir John and Lady Franklin and other persons connected with their suite on his arrival are not spoken of in terms of commendation. Sir John had incurred displeasure by the pertinacity with which, in spite of the warnings given him of the near approach of his successor, he had clung to his residence in the Government-house, and when Sir Eardly arrived, instead of Government-house being ready for his reception, he was necessitated, it is said, to write to the Colonial Secretary signifying his wish that he might under the circumstances land and be received as a private individual, taking up his abode with Mr. Bicheno. However, his welcome by the colonists was of the most enthusiastic character, and he had taken a tour through the interior, with the view of making himself acquainted with the localities, as also to present himself to those whom he is about to govern. Sir E. Wilmot was about to bring into force new regulations for the convict service, and the exertions of the new Bishop and his chaplains in their endeavours to improve the conduct of the unfortunate persons connected with it promise much for a better moral and social condition among them. A notorious bushranger of the name of Cash had been captured and tried for murder; and though by professional advice technical objections had been taken in arrest of the penalty due to his crime, the judges held out no hope of escape from the extreme sentence of the law. There is no other news worthy of special reference, and there appears to be no change in the state of trade. An address congratulatory of the Rev. F. R. Nixon, Bishop of Tasmania, on his arrival in the settlement, and his Lordship's reply thereto, the delivery of which is spoken of in terms of high eulogy, is given in these journals.

CITY.

Money Market, Friday.—Consols for account closed at 97; Three per Cents. Red., 97⅝ to ¾; Three-and-Half per Cents., 102¾; New Three-and-Half per Cents. 101⅞ to 2; Bank Stock, 190—1; Exchequer Bills, 65 to 67 premium.

Metropolis and its Vicinity.

Court of Aldermen.—A Court was held on Tuesday at which Alderman Copeland brought up the report of the inspectors of weights and measures. The report specified that in the past year 90 publicans, 40 butchers, 10 bakers, 46 coal-dealers and general shopkeepers, 17 greengrocers, cheesemongers and tallow-chandlers, 3 oil and colourmen, 10 greengrocers,, 4 marine storeowners, 4 tobacconists, 3 metal dealers, 15 provision merchants, and 5 wharfingers had been summoned and convicted. The total number of deficient weights and measures was 379; unstamped weights and measures, 1396; false balances, 163; total number summoned, 247; total number convicted, 247; appointed to be heard, 30. The report was entered on the journals of the Court. A former resolution awarding the sum of 400*l.* as an addition to the salary of Commissioner Bullock of the Central Criminal Court was rescinded, in order that the claim to an increased salary might be disposed of by the Court of Common Council, by whom Mr. Bullock was elected. The appointment of a Deputy-Governor of Newgate was deferred. Sir P. Laurie moved that so much of the presentments of the Wardmote Inquests as regards parties carrying on trades within the City, either by wholesale or retail, be referred to a committee of the whole court, to consider the best course to be adopted thereon and to report. This resolution was adopted, and a petition from the inquest of Castle-Barnard ward on the state of Puddle Dock, used by the contractor for the cleaning of the streets, was referred to the City Solicitor.

Bank of England.—It appears that the late disclosures at the Mansion House relative to fraudulent transfers of stock have induced the authorities at the Bank to withhold all information for the present on the subject of unclaimed dividends, and the clerks refuse to answer any inquiries made. It appears that the public security demands more stringent regulations, the inconvenience which may arise for the time to the parties interested is little to be compared to the permanent advantages which will possibly result from the change.

St. Stephen's, Walbrook.—The report made by Alderman Gibbs to the select vestry on the 22d December, 1833, together with an account of the receipts and payments of the said parish during his churchwardenship to Easter, 1843, has been published. The following is the auditor's report:—"We, the undersigned, members of the select vestry of the parish of St. Stephen, Walbrook, have carefully examined and audited the accounts of Mr. Michael Gibbs, churchwarden of the said parish, commencing 1825-6, and ending 1842-3 inclusive, and compared the payments with the vouchers (excepting for the year 1833-4, relative to the payments on behalf of the united parishes, which were mislaid by the churchwarden of St. Bennet Sherehog, and not returned; but inasmuch as such payments were all regular annual charges, and as the accounts for that year have been audited by St. Bennet Sherehog, and their proportion paid) we do therefore declare the same to be correct, and do find a balance to be due to the said churchwarden of 1302*l.* 3*s.* 6*d.*, which we authorise to be paid over to the said Michael Gibbs to Easter, 1843.—Witness our hands this 6th day of December, 1843. George Field, William Adams, W. E. Eddison, Thomas Whitaker."

Excise Prosecutions.—The adulteration of excisable articles appears to be increasing daily, and the Commissioners have lately been compelled to institute prosecutions in various parts of the country. Dr. Bird, the analysing chemist of the Board, has been constantly engaged for the last two months in analysing the various seizures of spurious and adulterated pepper alone, which amounts in the gross to several tons. This however is only one of the many articles that the public receive in an unwholesome form. Cocoa is also largely adulterated by the dishonest tradesman. A species of fine brown earth is mixed with it, and to render it invisible to the casual observer and prevent its being separated from the genuine article, a portion of mutton fat is introduced, which binds the earth with the cocoa, and at the same time gives it the apparent richness of good cocoa, only to be detected by the experienced eye. During the past week prosecutions under the authority of the Commissioners took place in the following places, and in every case a conviction with the penalties annexed was obtained:—For spurious pepper: in Worcester 6 informations, penalties 250*l.*; in Sunderland 12 informations, penalties 350*l.*; in Durham 2 informations, penalties 100*l.*; in Bristol 3 informations, penalties 100*l.* The adulterations in the above cases were —red and white mustard husks, rice, chilies, sawdust, earthy matter, sago, linseed, rape-seed, and wheat-bran. In Manchester, Thomas Raingell was fined 200*l.* for adulterating his stock of tobacco with turmeric and yellow ochre. A great number of other prosecutions for tobacco will follow, several lots of which are adulterated with tar and sand to the extent of 14 per cent.

The Preachership of Lincoln's Inn.—The election to this office vacant by the elevation of the Rev. Dr. Lonsdale to the see of Lichfield took place on Friday afternoon. There was a large attendance of benchers, among whom were present Lords Campbell, Brougham, and Bexley. There were no fewer than 17 candidates for the appointment, viz.: Archdeacon Manning, Rev. J. Vaughan, Rev. J. Garbett, Archdeacon Robinson, Rev. Dr. Hussey, Hon. and Rev. S. Best, Hon. and Rev. H. D. Erskine, Rev. J. E. Cox, Rev. C. E. Wylde, Rev. J. S. Boone, Rev. J. R. Page, Rev. W. Harness, Rev. T. Randall, Rev. J. S. M. Anderson, Rev. C. Merivale, Rev. F. Hewson. The election was decided in favour of the Rev. Mr. Anderson, of Brighton.

The Scottish Church in London.—A meeting of the congregation of the Scottish Church in Crown-court, Covent-garden, was held on Friday last, to receive the acknowledgment of the Rev. John Cumming their minister, for a testimonial presented to him. The sum raised by the congregation for this purpose amounted to nearly 600*l.*, a portion of which was expended in clearing off the remaining debt on their church, for which Mr. Cumming was responsible, and the other part was expended in presenting him with a large silver tea-tray and upwards of 100*l.* worth of books on theology. Mr. Cumming returned thanks at some length, stating his undiminished attachment to the Established Church of Scotland, while at the same time he did not see it his duty to leave a congregation to which his ministry was useful, and from whom he had received such testimonials of esteem. He had refused the highest church preferment in Scotland, for which refusal this testimonial expressed the gratitude of his people, and this he regarded as more than a triumphant refutation of the charges of interested motives so liberally imputed to him by the more violent free seceders. He only regretted that want of room prevented their receiving into that church members who were tired of contention; and he rejoiced that those who had left the parent Church in Scotland were rapidly returning to the church of their forefathers, not only in Scotland but elsewhere.

St. Katherine's Docks.—The half-yearly meeting of the proprietors of these Docks was held on Tuesday, Mr. Thos. Tooke in the chair. From the accounts of receipt and expenditure it appeared that the credit balance on 1st January, 1843, was 121,184*l.* 19*s.* 9*d.*, and that the like balance brought forward on the 1st inst. was 112,911*l.* 18*s.* 5*d.*, the net earnings during the past year having been less than in the year preceding, although the business transacted in the docks during the last year, both as regarded goods and shipping, had upon the whole exceeded that of 1842. The falling off in the amount of earnings was stated to be the consequence of the description of goods landed having been of a less costly character and the rates not so productive. The directors however recommended the proprietors to declare the usual dividend of 2½ per cent. for the half-year, the amount of income-tax to be defrayed by the company, which was agreed to.

State of the Streets.—On Tuesday, the foreman of Mr. Gore, the contractor for cleansing the streets of the City, appeared on a summons before the Commissioners of Sewers at Guildhall. The patentee of the new sweeping-machines was in attendance, and questioned by the Court as to the efficiency of the machines, which he declared to be adapted to the cleansing of the streets, provided the men worked them properly. It was, however, to be regretted that the men considered them an innovation, and did all to impede their utility. In proof of their excellency, the patentee referred the Court to the satisfaction which the machines gave to the inhabitants of Regent-street, where no dirt was to be found, and the same result would be produced in the City if the men in the employ of the contractor did their duty. The foreman was then called in, and said that Mr. Gore was confined to his bed, and unable to attend. The Chairman wished to know whether the new machines were suitable to the streets of the City? The foreman replied they were not; they were a complete failure. In fact, no contractor, however anxious he might be to keep the streets free from mud, could do it while using the machines. The construction of the machines, he said, are such, that they spill as much mud as they take up; for instance, if one of them is employed in Cornhill, and is there loaded, by the time it arrives at Puddle-dock it is found not to be more than one-fourth full. The vibration is so great that the mud is shaken out, and the brushes are not adapted for the streets. The contractor had put on 40 men to cleanse the streets, and had relinquished the use of the machines, which, in addition to their other alleged defects, were said to weigh nearly two tons each, and to be too much for the horses. The Commissioners, however, thought that the contractor's horses were in bad condition, and after discussing at some length the merits of the two systems, it was agreed to adjourn for a week, for the purpose of enabling the Commissioners to have practical proof of the effect of manual labour in opposition to machinery.

The Distressed Needlewomen.—On Monday a preliminary meeting of the friends of the poor needle-women took place at the Mansion-house for the purpose of adopting measures preparatory to a public meeting to be called in a few days. The Lord Mayor took the chair, and expressed his belief that the object of the meeting would be liberally carried out. He was surrounded by ladies who were anxious to be members of a committee to assist in the undertaking. His Lordship then read from a paper a statement of the intentions of the society. The object was to find work for as many of the unemployed as possible, and to ensure to them a fair remuneration for their labour. The work was to consist of children's clothes and females under-garments, manufactured expressly for

distribution to the deserving poor; the charity to be supported by subscriptions, and every subscriber to receive goods to the amount of the subscriptions, for private distribution, each article to be marked with the name of the establishment. The amount of each person's earnings not to exceed nine shillings per week: no middle-women, or job-masters to be employed, so that the actual labour may not exceed 12 hours a-day, thus serving two parties at the same time, viz., the needle-women so employed, and the destitute poor. Several ladies took part in the business of the day, and became members of the committee. A large sum was subscribed upon the spot, and the Lord Mayor and Alderman Farebrother announced their intention to receive subscriptions in aid of the society. His Lordship stated that a public meeting would in a few days be announced, and he confidently relied upon the attendance of all the patrons of the charities of London.—The Guardians of the Hackney Union have passed a resolution in which they "deprecate the low remuneration made in the metropolis to sempstresses, and believe that the present state of things so much condemned has been brought about by the anxiety of guardians of unions themselves and other superintendents of large establishments to find employment for their inmates even at a nominal price. That the master of the workhouse of this union be now directed not to receive any more slop-work, in the hope that this example may be followed by other boards of guardians of the metropolitan unions, and the evil so loudly complained of be redressed."

Fine Arts.—The Lords of the Admiralty have purchased the working model from which the statue of Nelson upon the column in Trafalgar-square was executed. The model is 5 feet 10 inches high, and is to be placed in a niche in the vestibule of the Admiralty, immediately facing the principal entrance to that building.

New Houses of Parliament.—In the appendix to the 14th annual report of the Commissioners of Woods and Forests just published, is the following report from Mr. Barry on the state of the New Houses of Parliament, dated in August last:—"The curtain portions of the river-front and a considerable portion of the north and south fronts are carried up to their full height in readiness for the roofs. The central portion of the river-front and the wings of the building are a little above the same level and probably will attain their full height in about four months from this time. Considerable progress is made with the superstructure of the western portion of the south front, the Victoria-tower, the Royal-gallery, the House of Lords, the central tower and adjoining corridors, and the west front towards New Palace-yard, all which portions of the building are upon an average about 15 feet above the level of the Trinity standard of high-water. The stone continues to be supplied in great abundance from the neighbourhood of Austin in Yorkshire for the external masonry, and there is no deficiency of supply of a stone which has recently been employed from Caen in Normandy for the internal masonry. The contractors have increased their number of hands at the quarry to about 300 men and have provided additional tackle, horses, &c., by which and other arrangements the supply of stone for the future will be even still more certain and abundant than it has hitherto been. The work executed and the contractors' arrangements for the progress of it at the building still continue to merit my entire approbation."

Metropolitan Improvements.—The Commissioners of Woods, &c., make the following report on the progress of their improvements:—"In our last report we stated the progress which had been made in purchasing the interests in the property in the several lines of improvement authorised to be made under the Acts 3d & 4th Vic., c. 87, and 4th Vic., c. 12; and we have now to state that on those several lines up to the 5th of January last we have completed purchases to the amount in the whole of 300,755*l.* 5*s.* 8*d.*, and have contracted for further purchases to the amount in the whole of 194,641*l.* 13*s.* 6*d.*, viz.:—1. In the line from Oxford-st. to Holborn we have completed purchases to the amount of 166,851*l.* 12*s.* 10*d.*, and we have contracted for further purchases to the amount of 15,906*l.* 15*s.* 2. In the line from Bow-street to Charlotte-street, Bloomsbury, we have completed purchases to the amount of 35,464*l.* 11*s.*, and have contracted for further purchases to the amount of 26,485*l.* 3. In the line from the London Docks to Spitalfields Church we have completed purchases to the amount of 44,157*l.* 16*s.*, and have contracted for further purchases to the amount of 71,102*l.* 18*s.* 6*d.* 4. In the line from Coventry-street to Long-acre we have completed purchases to the amount of 54,231*l.* 5*s.* 10*d.*, and have contracted for further purchases to the amount of 78,477*l.* 5. In the line from East Smithfield to Rosemary-lane we have not completed any purchase, but we have contracted for purchases to the amount of 2,670*l.* A statement is appended to the report showing our receipt and expenditure in respect of monies applicable to these improvements, by which it appears that of the sum of 500,000*l.*, mentioned in our last report to have been borrowed of the Equitable Assurance Company for the purposes of these improvements, upon the security of certain portions of the land revenue of the Crown in the county of Middlesex, there remained a balance of 166,918*l.* 1*s.* 10*d.* on the 5th of Jan. last."—The Commissioners on the meeting of Parliament intend to apply for a bill to carry into effect the long-projected improvements in Piccadilly. Government it is said has offered to pay the whole expense of widening the street from the mansion formerly belonging to the Marquess of Hertford, where the road is only 31 feet wide to Hamilton-place, taking the ground from the Green-park and making the whole of a uniform width of 70 feet, and the parishes of St. Martin and St. George are to keep it in repair.—A meeting was held last week in the vestry room of St. Paul, Covent-garden, to receive the report and plan of Mr. Paine, architect, on behalf of the parish, for the formation of a new street from the corner of St. Martin's-lane in continuation of the line from Coventry-street to the end of King-street. Resolutions in approval of the plan and report were passed, when it was determined that prior to proceeding in the ensuing session a deputation should wait upon the Duke of Bedford to request his assistance in advancement of the measure.

The Deptford Murder.—The woman Dickinson, who made an attempt upon her own life after having murdered her two children, is rapidly recovering. She is at present in custody of the police, who have had her in charge since the issue of the Coroner's warrant on Thursday week. As soon as she is sufficiently recovered she will be conveyed to Maidstone Gaol for trial at the ensuing Assizes. She appears perfectly collected, and admits that she destroyed the two children while sitting upon the bed, some time after which she made the attempt upon her own life.

Mortality of the Metropolis.—The number of deaths registered in the week ending Jan. 6th, was as follows:—West Districts, 139; North Districts, 172; Central Districts, 185; East Districts, 210; South Districts, 227: Total, 933 (males, 487; females, 446). Weekly average for the last five years, 946. The population by the returns of 1841 was 1,915,318, including the police on duty and 1366 men on the river; and the district of Wandsworth and Clapham are now for the first time included in the return.

Provincial News.

Provincial Fires.—The following fires, most of which are attributed to incendiaries, have been reported since our last:—On Saturday the 6th inst. at Great Barford Beds, a barn, stables, farming implements, &c. on the farm of Mr. T. Freshwell, and two small cottages adjoining; and on Monday on the farm of Mr. Riseley at the same place a great quantity of farming produce destroyed. The first was caused by a servant-girl who has been committed for trial. At Maulden near Ampthill in the same county, a clover-rick in the centre of a stack-yard belonging to Miss Kempson, destroyed; and at Eaton Ford, in the farmyard of Mr. Hall, whose premises at Eaton Town were burned down about three weeks back, another attempt has been made to fire the premises, but without success. On Wednesday at Harnden near Eastray on the farm of Mr. Buddle, a large double-floored barn containing about twelve quarters of wheat, some peas, beans, clover-seed, and a stack of oats, destroyed. On Thursday at Stokeinteignhead, Devon, the linhay on the farm of Mr. Rendle, with an adjoining barn containing corn and a threshing machine. On Sunday on the farm of Mr. Lindsell about midway between St. Ives and Hemingford, a large barn, four stacks of clover, the remaining portion of two hay-stacks, a quantity of barley and wheat straw, haulm, &c. On Friday, at Hucknall Torkard, Derby, on the farm of Mrs. Price, a stack containing about 12 quarters of wheat. On Friday, on the premises of Mr. Harley, of Wacton, near Long Stratton, an oat-stack destroyed; there is no doubt that it was the act of an incendiary as trains of combustible matter were discovered from the stack to two or three other wheat and barley stacks. At Ashton Gate, Bedminster, on the farm of Mr. Pimm, a shed of teasels destroyed. At Ipswich, the stabling and outhouses of the White Hart Inn, containing a large quantity of corn, straw, &c., destroyed.

Abingdon.—At the Berks Epiphany Sessions last week, Viscount Barrington in the chair, the report of the committee for rebuilding the county gaol at Reading expressed perfect satisfaction with the progress of the works, but the committee could not name a period when the prison would be fit for occupation until the new method of warming and ventilating the building had been brought into operation, and they hoped the works would be complete in about six weeks or two months. The report also stated that the builder had informed them that a further sum would be required to complete the building, but the committee did not now recommend the Court to advance any money, as they were not at present prepared to show the particular and specific object for which it was required. Mr. Crutchley as chairman of the committee said it was only on Saturday that they had been told by the architect that a further sum amounting to 6000*l.* was necessary to complete the building, miscalculations having been made on their former estimate of the cost. Several magistrates complained of this additional demand, and Mr. Duffield, M.P., asked to what extent the Court intended to go if the present application was granted? They were first told that the total outlay would not exceed 24,000*l.*; then they were informed that 32,000*l.* would be required; and now they were told that a larger sum than that was necessary to complete the building, the architect and builder appearing to think they might go on and repeat their application for further advances without check or restriction, and that they might spend the money of the rate-payers *ad libitum*. And this unnecessary expenditure was taking place at a period when the farmers were suffering considerably from poverty, and they as well as the rate-payers generally could ill afford such an increase to their present burdens. Mr. Dodson also complained of the great excess of the cost of the new gaol over the original estimate. Mr. Crutchley explained that in the original estimate of 25,000*l.* made by the builders, the expense of warming and ventilating the building, &c. had not been calculated, and that was the principal cause of the additional sum which had already been granted, it being requisite to carry out the design which had been agreed upon. The committee had exercised as much prudence and economy regarding the contracts as they possibly could, consistently with carrying on the works in a proper manner.

Bedford.—A desperate affray with poachers took place a few nights back, which was nearly attended with loss of life. It appears that a young man named Bird under-gamekeeper in the service of Mr. Hollingworth Maganiac, of Carworth, in this county, was watching his master's preserves and heard the report of fire-arms in Arsley-wood near the Kettering-road. Proceeding in the direction of the sound he perceived two men with guns, whom he pursued, and on approaching the poachers he saw that one of the men had something bulky in his coat-pocket. The gamekeeper grappled with his man in order to search him, when the two men attacked him and after beating him about the head and arms left him lying in the road in a state of insensibility. He recovered strength enough to enable him to crawl home, and having given a description of the poachers to the head-gamekeeper the latter obtained the assistance of the police, who went in pursuit of the men, both of whom, James Asplyn and John Elsom, have already been notorious characters. The prisoners were fully identified and committed for trial at the next assizes. The crime of poaching is said to prevail to a great extent in this and the neighbouring counties.

Birmingham.—A case was tried before the Recorder at the Borough Sessions on Saturday which will no doubt lead to results which every friend of common humanity will hail with satisfaction. Two poor debtors, named James Smith and John Taylor, who had been prisoners in the Court of Requests prison, were arraigned on a charge of assaulting William Buckerfield a police-constable. Mr. Mellor stated the case to the jury, which he said was an assault upon a constable which took place in the prison. From what he had heard that prison was a disgrace to any country and any age. He knew nothing analogous to it except the hold of a slave-ship. It was he had been assured a confined ill-ventilated hole, 6 feet by 9, underground, made out of the cellar of an old house, and that the stench therefrom was intolerable. It was impossible to use language too strong in describing it or in calling public attention to it. Such a disgusting and filthy place as the Birmingham Court of Requests prison he believed was a disgrace to any country and age. In this horrible place human beings who had contracted small debts which they were unable to pay were confined for various terms, according to the amount of their debts; at times there were 40 persons in it. It appeared that disturbances frequently arose, and the keeper was compelled to call in the assistance of the police. On Christmas-day Mr. Boot, the keeper, permitted a number of friends of the prisoners to visit and spend a short time with them. They were allowed to have malt liquor, and a scene of riot and confusion ensued amongst the parties. In this state of things Mr. Boot sent for a police officer to quell the disturbance, and the prosecutor came. When he entered he was seized by some of the party, knocked down, beaten with a staff, and cut severely on the head by one of the prisoners with a large stick. It appeared from the evidence of the keeper, that there was a practice there called "chumming up." When a new prisoner goes in, he is welcomed by the prisoners who are in the prison and beat round with the chumming instruments.—What are those chumming instruments?—Old swords and staves. Is there a little music?—They generally have a fife. Are there any masks?—Yes; the prisoners put on masks. And after this ceremony of "chumming up" is over, do the prisoners demand from their new brother prisoner any money?—Yes; they demand 2*s.* 6*d.* from him. Mr. Mellor—And if he cannot pay the half-crown demanded of him, do they take the coat and waistcoat off him?—I believe they do. And they keep it as a sort of pledge?—I believe they do. So, if a poor man comes into your prison, so poor that he cannot pay half-a-crown, his coat and waistcoat are taken from him, and he is compelled to remain without these garments to cover him?—The keeper said that frequently the rioting and drunkenness are so violent that he dared not go in among the prisoners; he had been repeatedly in the fear of his life. He further deposed that in this underground dungeon the poor debtors were imprisoned who do not "go through the Act"—that is, those who do not take the benefit of the Insolvent Debtors' Act. I am not, said he, in fear about those who "go through the Act,"—they will remain their time; they will not run away; the others will. The highest amount which the poor debtors, who will run away if they can, are put into the prison for, is 5*l.* Those debtors all sleep above, in one room; if any one of them wish to sleep at night in the place in which they are confined during the day, they do so; one or two of the poor debtors confined there sleep in the underground prison; they are unable to go up-stairs. They have straw to sleep on up-stairs. I cannot say how large the sleeping-room up-stairs is; I never measured it; I cannot say whether it measures more than 15 feet. They never pay anything for the straw they lie upon. These poor debtors do not pay anything for their night's lodging, unless they want a bed and then they must pay for it. They do not have a bed unless they pay for it. I cannot find beds for nothing. There is a window to the bed-room up-stairs. The prisoners are not locked in their bed-rooms at night. One of the poor debtors stands in the day-time in the underground place at the window, and tingles a can; this window at which he stands is in the front of the Court of Requests; it is near the entrance-door. This window is barred like a cellar-window. He stands there to crave charity of persons as they come to the Court on business. As he tingles the can he says, "Pray remember the poor

Answer:" It may be called a cellar-window. The place in which the poor debtors are confined was a cellar. Mr. Mellor.—In this room up-stairs, where 23 poor debtors sleep at night, there is a sort of wooden bedstead for them to lie upon, similar to a dog-kennel, and they are turned down like dogs. They have not so much room to sleep in as hounds have. They lie 10 or 11 on a side in this kennel. The Recorder.—In a row? Mr. Mellor.—Yes, Sir; feet to feet. Do their feet touch, Mr. Boot? Mr. Boot.—I cannot say whether their feet touch or not." The Recorder said the whole affair was a disgrace to humanity, but still the jury must decide the case on its own merits, as a violent assault had been committed. The prisoners were convicted, and sentenced to three months' imprisonment in Warwick gaol, where, said the Recorder, they will at least be treated as human beings.

Buckingham.—A document containing the signatures of the tenant-farmers of Buckingham and its vicinity has just been issued, requesting the attendance of all farmers, tradesmen, and others desirous of upholding the agricultural interest, at a public meeting, to be held at the Town Hall, Buckingham, this day the 20th inst., for the purpose of adopting such measures as may be thought advisable to counteract the proceedings of the Anti-Corn-law League.

Cambridge.—The list of Mathematical Tripos was published yesterday, by which it appears that Mr. G. W. Hemming, of St. John's, is the Senior Wrangler; Second Wrangler, Mr. W. B. Hopkins, of Caius; the first Senior Optime, Mr. C. Hardwick, of St. Catherine's; first two Junior Optimes, equal, Mr. R. E. Robertson, of Caius, and Mr. G. F. Snowball, of St. John's.

Carmarthen.—It is stated by the *Carmarthen Journal* that Shoni Sgyborfawr and Dai y Cantwr, the persons who at the late assizes were convicted for Rebecca riots and severally sentenced—the former to transportation for life, and the other for 20 years—have made confessions to William Chambers, Esq. jun. of Llanelly. Shoni confessed to him that he was present at the burning of Mr. Chambers' two farms, namely, Mansant and Tynywern. He also mentioned several nightly meetings he had attended, where measures were taken to avoid the military, who at that time patrolled the country. He admitted that he was one of a party who pulled down a dozen gates, which he named, and the several nights on which they were demolished. He further gave the names of several farmers present with him. It appeared from his statement that he and his companions were to be paid a certain sum a day for breaking down gates, and that he and many others were paid 5*s.* each for setting fire to Mansant from a publican, who acted as treasurer. He further states that the old woman at Hendy Gate was shot by a boy unintentionally. Dai y Cantwr states that he was present with Shoni in many of his midnight riots, and was present when the farms of Mansant and Tynywern were fired, and that he saw Mr. Chambers' horse shot. He has mentioned the names of several persons who assisted in the commital of outrages upon property in this and the adjoining counties. He further states that the proposition to shoot Mr. Chambers was not the wish of any one person in particular, but that it was the opinion of the people generally that the younger Mr. Chambers ought to be shot.

Durham.—At a meeting of the Durham Farmers' Club on Saturday last a resolution was proposed condemnatory of the proceedings of the League and pledging the farmers to use their best exertions to counteract the effects produced by the League agitation.

Framlingham.—On Saturday a public meeting was held in this town to follow up in Suffolk the movement begun in Essex in favour of protection to British agriculturists. The principal room in the inn where the meeting was to have been held being filled, an adjournment to the school-room adjoining the almshouses took place. John Mosely, Esq., of Glemham House, President of the Association took the chair, and among those present were Lord Rendlesham, Lord Henniker, Hon. and Rev. Mr. Hotham, Rev. George Attwood, and a large body of agriculturists. Resolutions against the League and in favour of protection were unanimously carried, and a long list of subscriptions was read.

Halifax.—In a case in which the evidence of a little girl was material the following facts were elicited last week by the magistrate:—She gave her name Sarah Ann Jagger, and her father, (whose dress betokened a situation far above that of a common working-man) said she was a few weeks off 8 years of age. On being questioned however in order to ascertain her capacity to be sworn, her answers betrayed a degree of neglect on the part of her parents which drew upon the father the severe condemnation of the bench. She said she did not know who God was, nor what he was; nor had she ever heard there was one! She never went either to church or chapel, or Sunday-school, nor her parents either. They never taught her to say her prayers, nor did she know what it was to pray. She did not know the nature of an oath. Had never been told always to speak the truth. Had never been told not to tell a lie. The prisoner was dismissed, but the father of the girl received a severe reprimand.

Hereford.—Mr. Barneby, M.P., has resigned the chairmanship of the quarter sessions for the county of Hereford in consequence of the rejection by the magistrates of a motion for dismissing the governor of the gaol. In acknowledging the receipt of the communication announcing this result Sir J. Graham writes to Mr. Barneby as follows:—"I have carefully considered the whole of the evidence respecting the governor's conduct, the several facts proved against him, and the statement which he has made in his defence, and I cannot entertain a doubt that your motion was fully warranted by the circumstances of the case, and not stronger than was necessary. I cannot but regret the decision of the court of quarter sessions, which appears to me not to be such as the truth of the case and the interests of the public required; and I particularly regret that this decision has had the effect of depriving the public of your honourable and useful services as chairman of the court of quarter sessions."

Isle of Man.—On Tuesday Henry Tyson, who was examined on Monday week, charged on his own confession with being an escaped felon from Castle Rushen, was again brought before the magistrate at Woolwich, where he had surrendered. A letter was read from Inspector Bellion, of the Douglas Police, in reply to a letter from the magistrate's clerk, stating that the prisoner's statement was strictly correct, and requesting that he might be sent in custody to Douglas, from whence he would be conveyed to Castle Rushen, from which he had effected his escape. The magistrate told the prisoner that as his story appeared to be true, he should order him to be sent to Castle Rushen with as little delay as possible.

Rochester.—The neighbourhood of the Earl of Darnley's estates at Cobham is greatly infested by poachers, although the exertions of the trustees have lately reduced their number. On Monday a notorious character named James Goodhew was brought before the magistrates, charged with trespassing upon land in the occupation of Mr. W. Lake at Chalk on Wednesday last with wires in the pursuit of game. The prisoner, who had been convicted of poaching twice before, pleaded guilty to day-poaching, but not guilty to night-poaching, the offence having taken place in the afternoon after five o'clock. The bench said that the question turned on the fact whether or not it was night, and on consulting the almanack they found that the sun set that day at four minutes past 4 o'clock. The bench convicted the prisoner, who promised, if let off, not to repeat the offence. The chairman told him that he thought it was not in his power to refrain from poaching. He had as great a taste for it as gentlemen had for sporting, but the game must be protected. He therefore sentenced the prisoner to two months' imprisonment and hard labour, at the expiration of that time to find two sureties in 5*l.* each for his good behaviour, or be further imprisoned for six months.

Kirkdale.—The sentence of death passed on Ann M'Cormick who was convicted at the late special commission before Mr. Justice Wightman of the murder of her infant child by administering arsenic to her, has been commuted to transportation for life. The reprieve was received on Wednesday, but before its arrival the culprit had made a confession of her guilt to the chaplain. She acknowledged that she had given the child the poison, adding that she took as much arsenic herself as she believed would have destroyed her own life.

Leeds.—On Sunday morning some shots were heard in a small Fir-wood adjoining Worsborough Hall, the residence of W. B. Martin, Esq. That gentleman and his servants with the gamekeeper were aroused, and made towards the spot; but previous to the whole force collecting, two of the watchers came in collision with a gang of poachers and were severely treated by them; their guns were broke, a fine dog that seized one of the poachers was shot, and one of the watchers was wounded, having received several heavy blows on his head. Before Mr. Martin and his servants arrived the poachers had made their escape into an adjoining wood.

Lewes.—A meeting of the East Sussex Agricultural Society was held in this town on Wednesday, Mr. Mabbott Vice-President in the chair, supported by Sir H. Shiffner, Bart., Mr. Darby, M.P., &c. Resolutions were passed deprecating the decrease in the price of corn, and pledging the meeting to oppose in every possible way the Anti-Corn-law League, and to attend a meeting to be held at Steyning for that purpose on Monday the 29th.

Maidstone.—On Tuesday last a meeting of landlords and farmers was held at the Star Hotel, to take into consideration the propriety of forming an association, or adopting other measures for the protection of agriculture against the Anti-Corn-law League. The principal speakers were the Chairman, Mr. Noakes, Colonel Austen, Lord Marsham, Mr. Croughton, Sir Edmund Filmer, Mr. Elvy, Mr. Whittaker, Mr. Ellis, &c., and it was unanimously agreed that a provisional committee be formed, with power to add to their numbers, for the purpose of calling a public meeting to form an association for the protection of agriculture.

Plymouth.—The Dutch man-of-war schooner Lancie came into this port on Sunday in distress, having on the 12th in mid-channel carried away both her masts within six feet of the deck. Fortunately, at 2 A.M. on Saturday, when within 20 miles of Jersey and Guernsey, and fast drifting on the dangerous rocks near those islands, she fell in with the revenue-cutter Active, by which she was safely conducted into harbour. The Lancier left the Texel on the 9th, bound to a Dutch colony on the coast of Africa, established for the suppression of slavery.

Reigate.—A meeting of the farmers and occupiers of land in the neighbourhood of this town was held on Tuesday for the purpose of considering the best means of opposing the measures of the Anti-Corn Law League. The requisition was signed by all the principal farmers in the district, and a number of these together with some of the county gentlemen were present. Mr. Foskett was the principal speaker, and proposed a resolution to the effect that the existing protection to agriculture was an insufficient return for the peculiar burdens to which land was subject, that a reduction of these duties would spread universal ruin, and that they should by all legal means resist the League. Other resolutions, recommending the union of agriculturists with the common object of protection were passed by acclamation, and a committee was formed to carry out the objects of the association.

Sheffield.—At the meeting of the town-council of this town on Wednesday the police surveyor submitted to the council an instrument of destruction which a few days ago was found concealed on the premises of Mr. Kitchen, manufacturer, of Earl-street. Its length was about 24 inches, its diameter at each extremity about 4 inches, and the centre 6 inches. Both extremities were plugged up and in the centre was an orifice capable of receiving a fusee commonly used in blasting coal-mines and other excavations. The case was of cast-iron and computed to be charged with not less than four pounds of gunpowder. A fusee as described of about three yards in length was found attached, but its combustion had been destroyed owing to the improper manner in which it had been inserted in the perforation, otherwise there might have been devastation and destruction too appalling to contemplate. Mr. Raynor stated that he had shown this machine to Lord Wharncliffe who requested that it should be forwarded to Sir James Graham. His Lordship intimated that he should be glad to render his best assistance in the prevention of any further attempt of the like nature on the lives and property of the people of Sheffield.

Stafford.—Sarah Westwood convicted at the last special assizes for the county before Mr. Baron Rolfe, for the murder of her husband by arsenic, was executed on Saturday at Stafford. It appears that the culprit was the daughter of a labouring man living at Churley, a hamlet near Burntwood where the murder occurred.

Windsor.—Captain Moore late of the 67th regiment who received the appointment of a Military Knight on the death of Captain Cumming in June last, has been appointed to the Governorship in the room of the late Captain Fernyhough. The new Governor was the junior knight.—On Tuesday last Mr. Alfred Raffle, son of Mr. Raffle of Horton near this town, met with a serious accident by the discharge of his fowling-piece. It appears that the young gentleman was withdrawing the charge without having taken the necessary precaution of first removing the cap, when the gun suddenly went off, and the ramrod and whole of the charge passed through his hand, which was so frightfully shattered that on the arrival of Sir John Chapman surgeon of Windsor, Dr. Baker of Staines, and Mr. Adams, another professional gentleman from Colnbrook, it was deemed necessary to amputate the arm below the elbow, which was skilfully performed by Mr. Adams. Mr. Raffle is going on favourably.

Railways.—The following are the returns for the past week:—Birmingham and Derby, 1170*l.*; Birmingham and Glocester, 1650*l.*; Eastern Counties, 3359*l.*; Edinburgh and Glasgow, 2068*l.*; Great Western, 10,205*l.*; Grand Junction, 6218*l.*; Glasgow, Paisley, and Ayr, 1548*l.*; Great North of England, 1141*l.*; London and Birmingham, 12,322*l.*; South Western, 4847*l.*; Blackwall, 636*l.*; Greenwich, 665*l.*; Brighton, 2062*l.*; Croydon, 208*l.*; Liverpool and Manchester, 4206*l.*; Manchester, Leeds, and Hull, associated, 5095*l.*; Midland Counties, 2178*l.*; Manchester and Birmingham, 2528*l.*; North Midland, 3407*l.*; Newcastle and Carlisle, 1127*l.*; South-Eastern and Dover, 2248*l.*; Sheffield and Manchester, 669*l.*; York and North Midland, 1269*l.*—The principle of atmospheric traction, successfully brought into operation on the Dalkeith branch of the Dublin and Kingstown railway, is likely to be brought into extensive use upon short lines. Among others in which it is said it might be profitably employed, are the Blackwall and Greenwich railways; and one of the projected lines to Gravesend and Rochester, under the superintendence of Mr. Brunel, is started on the understanding that the line will be worked by atmospheric traction.—It appears from a series of resolutions advertised in the daily papers, that a strong opposition has been raised by the Croydon landholders, including the most wealthy proprietors, against the proposed Croydon branch to Epsom; and from the determined course which these parties have taken, a formidable array in Parliament may be expected when the competing lines bring forward their respective cases. The route by the Southampton line is stated to have the preference, and little opposition is anticipated in that quarter.

IRELAND.

THE STATE PROSECUTIONS.—Another application for a postponement of the trials was made to the Court of Queen's Bench on Friday. On that day, Mr. Moore, Q.C. on the part of the traversers applied for a postponement until the 1st Feb. next, in order to afford time for the rectification of the jury list, by the insertion of the names of qualified special jurors which had been omitted or suppressed in the list returned by the Recorder to the High Sheriff, and for the striking of a new jury list. The Attorney-General opposed the application on the ground that the Court had no jurisdiction, and that they could not interfere in the case. The Court unanimously decided that the application could not be granted. The trials consequently commenced on Monday. Mr. O'Connell went to the Court in the state carriage of the Lord Mayor, followed by the carriages of the other traversers, and of the Aldermen and officers of the Corporation, in procession. The traversers were loudly cheered in their passage through the streets and on arriving at the Four Courts.

First Day.—On Monday the Judges of the Queen's Bench took their seats at 10 o'clock, and the counsel and agents at both sides were in attendance. After some delay the traversers all appeared and answered to their names. The special jury summoned—twenty-four in number—were then called, and, with the exception of three or four, severally answered to their names. Satisfactory affidavits were made to excuse a few from serving on the ground of ill health. The general list having been then called over, the gentlemen to compose the jury of 12 were about to be

impanelled, when Sir Coleman O'Loughlin, Counsel on behalf of Mr. O'Connell, rose and handed in a "challenge to the array," that is to say, to the whole jury panel, on the ground of the omitted names in the Recorder's list, of which so much has already been said. He read this pleading at length, and stated that each of the traversers would put in a similar but separate and distinct paper, and that these were being prepared. The Attorney-General said that whilst the challenges of the other traversers were engrossing, he would confer with his learned brethren, and consider what course they would pursue with regard to this challenge. A delay of two hours was thus occasioned, and it was near two o'clock in the afternoon before the challenges of the other traversers were put in. The Attorney-General then rose, and said that on the part of the Crown he demurred to these challenges, and proceeded to argue against their validity. The question now raised was essentially the same with that which was discussed on Friday last, on the motion of the traversers, to postpone the trial on the alleged defect in the Jury panel. The Attorney-General pursued the same line of argument that was used on that occasion. He remarked that no attempt was made to attach criminality to any known individual, and that unless corruption or fraud were proved or alleged against public officers, the presumption in law was that they discharged their duties correctly. If this challenge were admitted, it would nullify the jurors' list for 1844 altogether—and this merely on the ground that some 59 names had been omitted, nobody could tell by whom. He (the Attorney-General) would be most happy to discover the author or authors of any fraud, or wilful omission in the forming of the jury, and was ready at once to institute a prosecution against him or them; but whilst all the public officers were, even by name, acquitted of all blame—and, so far as they knew, all the requisitions of the Act of Parliament in forming the special jury panel had been complied with—he must insist that the panel retained all its legal validity, and afforded no ground for such a plea as that which had been put in by the traversers. Sir Coleman O'Loughlin argued in support of the challenge; and was followed on the same side by Mr. Fitzgibbon, Queen's Counsel. The Solicitor-General (Mr. Green) replied. He contended that there were no legal means pointed out in the Act of Parliament, or otherwise, to amend the jurors' list in such a case as the present, and strongly insisted that the traversers could suffer no injury by its being maintained in its present state. The Counsel at the other side had expressly declared that they had no fault to find with the gentlemen in attendance to serve as jurors on their trial. Mr. Moore, Q.C, proposed on the part of the traversers to send back the lists to the Recorder by consent, and to have the omitted names inserted in it, and the trial to be postponed till after this arrangement had been effected. The Attorney-General rejected this proposition with great indignation as one utterly illegal. The Chief Justice then announced that the majority of the Court were of opinion that the challenge to the array was bad, and that the demurrer of the Attorney-General must be allowed. His Lordship and the other Judges then delivered their judgments, Mr. Justice Perrin dissenting. The other Judges said they were clear in their decision, and Mr. Justice Perrin said that he gave a different judgment from his brethren with considerable doubt.

Second Day.—The Court assembled on Tuesday at 10 o'clock, and the jurors and traversers were called over. The jurors all appeared; but two of the traversers, Messrs. Duffy and Barrett, were absent. The Court waited for some time, but neither of these parties appeared. Their solicitors offered an undertaking that they should abide by anything done in their absence, and their counsel argued that this being merely a case of misdemeanour, there was no absolute necessity for the parties accused to appear in person. The Attorney-General however said he could not accede to this arrangement. The traversers were bound in recognizances to appear personally throughout the whole of the proceedings, and their appearance by attorney could not be accepted—particularly as it might be necessary in the course of the evidence to establish a case of identity, in which they were concerned. After some further delay, the Chief Justice ordered them to be called on their recognizances, when they immediately came into Court; the swearing of the Jury to try the case was then commenced, and after a few excuses for non-attendance on the ground of ill-health, which were all allowed after a sufficient investigation, it was completed. The Jury comprised the following gentlemen:—1. James Hamilton, 14, Upper Ormond-quay, wine-merchant; 2. Captain Edward Roper, 15, Eccles-street; 3. Edward Clarke, 128, Stephen's-green West, Esq.; 4. Francis Faulkner, 78, Grafton-street, grocer and wine-merchant; 5. John Croker, 36, North Great George's-street, wine-merchant; 6. Henry Flynn, 25, William-street, pianoforte maker; 7. Henry Thompson, 28, Eustace-street, wine-merchant; 8. Anson Floyd, 19, Mellington-quay, china warehouse; 9. John Rigby, 175, Great Brunswick-street, gunmaker; 10. Robert Hanna, 12, Henry-street, wine-merchant; 11. William Longfield, Esq., 19, Harcourt-street; 12. William Ord, 79 and 81, Cork-street, tanner. Mr. Napier opened the pleadings, and briefly stated the heads of the several counts in the indictment. At half-past eleven the Attorney-General (Mr. T. B. C. Smith, M.P. for Ripon,) began to state the case to the Jury, and continued speaking until half-past four without finishing his statement. He commenced by an exposition of the general nature of the charge. It implied, he observed, that the traversers had conspired and confederated together to create discontent and disaffection among her Majesty's subjects in Ireland, and by the display of physical force and other means to intimidate the Government, and bring about a dissolution of the Legislative Union. He next proceeded to quote the opinions and decisions of various Judges both in England and Ireland on the laws of conspiracy. With regard to the "boasted peacefulness" with which the traversers carried on their unlawful designs he contended that this very peacefulness was only an aggravation of their guilt. Having disposed of this branch of his subject the Learned Gentleman commenced his review of facts and public events with the passing of the Roman Catholic Relief Bill in 1829. He adverted to the various Associations which had been formed since that period, having for their object the Repeal of the Legislative Union between England and Ireland, to the hostility which they encountered from Lord Althorp and the Administration of Earl Grey, their denunciation from the Throne, and the proclamations issued against their meetings by the Irish Government under a temporary Act of Parliament now expired; the formation of the Precursor Society, and finally that of the present or Loyal National Association, in which all the traversers took an active part, and of which they must be presumed to be members. He then entered into an explanation of the nature and constitution of this Society; its mode of connecting all ranks of society by means of cards and subscriptions varying from a shilling to a pound, and creating the different orders of associates, members, and volunteers. He exhibited these different cards and described the devices upon them as being all of a seditious and inflammatory tendency. He described the institution of provincial inspectors, Repeal wardens, and collectors, and the arrangement which insured the circulation of inflammatory newspapers amongst all subscribers to the funds of the Association. He read and commented upon several articles in the *Pilot* and *Nation* papers patronised and circulated by the Association, and particularly dwelt on some of the songs which they contained. He next proceeded to the monster meetings and took them up by order beginning with Mullingar; and the dinner speeches of Bishops Cantwell and Higgins. He passed thence to the meetings at Longford, Drogheda, Mallow, Cork, Donnybrook, and others, reading passages from speeches delivered at each, and describing the multitudinous assemblies collected, the devices used, the processions marching in array from various quarters, headed by temperance bands &c. Most of the matters recounted by the learned gentleman were however tolerably well known to the greater part of the auditory, and the recapitulation of them, even under the existing circumstances, was not therefore attended with all that interest to his audience which otherwise it might have been. It was suggested by counsel on the other side that the Court should adjourn at a reasonable hour, and that the Attorney-General should resume his speech on the next day. The Learned Gentleman said he would attend to the hint, and closed for the day at half-past four, after speaking for nearly five hours. A discussion then arose as to what was to be done with the Jury; it was finally agreed on all sides that they should retire to their homes after receiving a caution not to hold communication with any person on the subject of the trial.

Third Day.—The Court assembled on Wednesday morning at 10 o'clock, and the Jury and traversers having been called over the Attorney-General resumed his statement. He took up the thread of his narrative at the Baltinglass meeting held on the 6th August. He read some selections from the speeches delivered on that occasion, and to show the effect produced by them recited different observations made by the people among themselves, such as these:—"We are determined to get Repeal, for we are a sober people now and cannot be put down as we were in '98;" others exclaimed that they "would turn out and fight for Repeal to a man;" others said that "Father Lalor told them in the chapel they would get the Repeal, but not without blood; but the time is nearer than you think." A contemporaneous publication in the *Nation* newspaper was next commented upon, and particularly a passage in which it was said that it was "the absence of vice or riot at those meetings which made them a strong and formidable event." The Attorney-General said he rejoiced that he had been saved the misery of witnessing the results which must have followed had the multitude attempted to carry out the designs of the conspirators by physical force; but the absence of such an event did not, he contended, take away from the illegality of the proceedings of these parties, because it would seem that they were only waiting to complete the organisation of the country and for certain contingencies in order to make an effort of the last extremity. The learned gentleman proceeded then to give an account of other meetings in the County of Monaghan, and Tara in Meath. At Tara the ancient Kings of Ireland were elected, and it was also the scene of a defeat of persons engaged in the rebellion of '98. It was chosen, he said, for these reminiscences. The conduct of the people and Mr. O'Connell's speech on this occasion furnished a fruitful subject of observation—more particularly Mr. O'Connell's announcement that the Union was totally void, and not binding on the people either in law or conscience. The Attorney-General combated this assertion; he then adverted to the assemblage at Loughrea, and thence passed to a meeting of the Repeal Association held in Dublin at which the plan of Arbitration Courts as recommended by a committee was brought forward and adopted. Her Majesty's speech from the Throne at the close of the last session was next introduced, and next Mr. O'Connell's manifesto in reply. Contemporaneous publications in the *Pilot* and *Nation* formed part of the history, and supplied the principal materials of the case sought to be established against the traversers, particularly the design of corrupting the army and rendering the soldiery indisposed to maintain the rights and prerogative of the Crown. A speech made by one of the traversers at Clifden in Galway county, regretting the bad state of trade and the absence of all manufacturing industry in the county gave occasion to the Attorney-General to retort upon the speaker, and to charge the conduct of the traversers as one of the most efficient causes of producing that ruinous state of things which they affected to deplore. He came next to the great meeting at Mullaghmast, on which he dwelt at great length, going through all its particulars. He concluded his history of the agitation with the intended meeting at Clontarf—the Repeal cancelled advertisement, and the subsequent meeting at the Corn Exchange in Abbey-street. His address now verged to a close, and after a short peroration in which he recapitulated the charges in the indictment and glanced at the arrayed evidence, he appealed to the jury if they would have a doubt of the guilt of the accused if he should succeed in substantiating all the allegations he had made. He concluded by a quotation from a charge delivered by the late Chief Justice Bushe upon a special commission at Maryborough. The Learned Gentleman's speech was exceedingly temperate but consisted for the most part of a mere narrative of facts and recitation of contemplated evidence. It was concluded at a quarter past four o'clock and the Court then adjourned to next morning, when the examination of witnesses was to commence.

Fourth Day.—The whole of this day up to four o'clock was occupied in the examination of the first witness, Mr. Hughes, the Government Reporter, proving the speeches made at the meetings. Mr. Frederick Bond Hughes examined by the Solicitor General—Is a shorthand writer and has been in the habit of reporting for the last 17 years. On Sunday the 1st October he went to Mullaghmast; there were many persons on the ground when he arrived; there were about 45,000 persons on the ground during the day; witness saw bodies of people coming having banners; took a note of the speeches made on the occasion; on one flag was "Huzza for Repeal," and on another "A nation of nine millions is too great to be dragged at the tail of any nation;" and in front of the platform "The man who commits a crime is an enemy to his country;" the musicians wore fancy costumes, and a number of men had staves in their hands, and papers marked "O'Connell's Police." The witness here identified Mr. O'Connell as being present, and Mr. O'Connell bowed to him. Dr. Gray was present at that meeting; also Mr. Steele and Mr. Ray. Mr. O'Connell was dressed in a sort of velvet robe, of a scarlet colour. When Mr. O'Connell arrived several gentlemen proposed him to the chair, which was passed. Witness took a note of what he said, and produced both the transcript and the original note. [Mr. Hughes next read the opening address of Mr. O'Connell at Mullaghmast.] The Chief Justice requested witness to read one of the closing passages again in which the speaker declared that the Union was absolutely void, although supported by the policeman's truncheon, the bayonet of the soldier and the courts of law. The traversers' counsel requested that the whole of the speech should be read, as there were very many passages which would qualify those parts read by the Attorney-General. The witness read the speech which was of great length. Mr. Aylmer proposed the first resolution at the meeting and Mr. Hackett of Kilkenny moved the second, declaring in the face of America and France that standing on the graves of the martyred dead, they themselves in the face of high heaven declared that no power ought to make laws to bind the Irish people except the Queen, the Lords, and Commons of Ireland. After this resolution passed a rotten velvet cap was placed on Mr. O'Connell's head and an address presented to him by a committee; he made a brief address after the national cap had been placed on his head. Another resolution was passed to follow his guidance under all and every circumstances; the meeting was held in the open day. I was present at the dinner; Mr. John O'Connell was there, Mr. O'Connell, Mr. Steele, Mr. Barrett, Dr. Gray, and Mr. Ray; I had never seen any of those gentlemen before that day except the Messrs. O'Connell. Mr. John O'Connell presided at the dinner and after dinner he made a speech, (the witness read extracts from it and also a letter of the Hon. Thomas French); Was told on that evening that the name of one of the gentlemen who spoke was Mr. Barrett; the health of Mr. O'Connell was proposed, and he spoke: he stated that the Queen, if she made one hundred speeches instead of one, it would not change the purpose of the Repealers, although he had a great respect for her Majesty who was the first of her family that was not a decided enemy to Ireland (these several addresses the witness read at length). In alluding to the Duke of Wellington, Mr. O'Connell said that the poor old man was not an Irishmen; he was born in Ireland, but it was not because a man might be born in a stable that therefore he would be a horse. He also denounced the county members, Messrs. O'Farrell and Archbold, and called the latter a traitor to their cause. Mr. Ray responded to the toast of the Repeal Association; he asked "Where was the Ministry that could measure their power?" and praised the working of the arbitration courts, which for the first time gave cheap justice to Ireland." He told the assemblage "that the will of the liberator must be their law," and that if they were not willing to lie down as slaves they should join the Association. Dr. Gray also spoke, and among other matters he observed, "that he must deny the statement that the Judges appointed by the people were powerless, but they had greater power than Lord Chancellor Sugden." On the 2d of October witness attended the Association, and mentioned that he came there to report. He obtained a ticket on the 3d from Mr. Ray

The ticket was to this effect: "Admit ... at all times to the meetings of the Associa... Witness suggested that the card ought to have on ... Mr. Tyrrell, and Mr. Steele were present.—The ...-traversers' counsel required that the whole of the speeches ... the meeting should be read. The Solicitor-General ...—The doing of that would occupy three hours, but we ... have read the whole of each speech of which any ... part is given. The witness then read the speech of ... Rev. Mr. Tyrrell, the day after the proclamation, ... the resolutions which were passed, pledging ...selves—"come weal or woe, never to desert ... constitutional standard of freedom raised by O'Con...." At the meeting of the Association on the ... of Oct. Mr. Duffy handed in several contributions; ... Dr. Gray also handed in various sums.—The examination ... chief of the witness closed here, and the Court then ... adjourned for 20 minutes to allow the jury to take some ... refreshment. The Solicitor-General begged leave to ask ... question of the witness as to whether he had any note ... of what was said by a Mr. Greene, one of the Liverpool ... reporters at the meeting on the 9th Oct. Mr. Hughes ... referred to a speech made by Mr. Greene, who attended ... the Association as a Repeal warden from Liverpool.—Mr. ... Hatchill Q.C. intimated that he was counsel for Mr. Ray, ... and did not mean to examine on the part of the traversers. ... A quarter past four Mr. Fleming Mathius Latham was ... sworn and examined. He deposed to the facts stated by ... Mr. Hughes relating to meetings at Mullaghmast, &c.

Dublin.—On Friday the debate in the Corporation on ... the motion of the ex-lord Mayor for an address to the ... Queen, praying that the State prosecutions may be aban... ...ment was resumed. An amendment was moved to the ... effect that, regarding the memorial as an improper interfer... ...ence with the course of justice in this country, it was the ... opinion of the house that it should not be adopted. After ... a long debate the assembly divided, when there appeared ...—for the amendment 10, and against it 28. The original ... resolution was then put and carried without a division, upon ... which it was moved and agreed to that the memorial be ... transmitted to her Majesty through the medium of a depu... tation.—On Saturday a meeting of the Roman Catholics ... of Ireland, convened by a numerously-signed requisition ... at the head of which was the Lord Mayor, was held for ... the purpose of "petitioning the Queen to direct her ... attention to the conduct pursued towards her loyal and ... devoted Catholic subjects by her Majesty's present Government." As the hall was densely filled in every part there could not have been less than 3000 persons present. The meeting was addressed by Mr. Wyse, M.P., Sir Thos. Esmonde, Sir John Power, Mr. Sheil, and Mr. O'Connell. Resolutions were passed condemning the exclusion of Catholics from the jury panel, and a petition to the Queen on the subject was unanimously adopted.—On the same day the reporters of the Dublin press held a meeting at which they resolved, "To declare their conviction that to compel reporters and correspondents of the public press to give evidence in the course of judicial proceedings respecting matters which come under their observation exclusively in that capacity would be attended with great public inconvenience, would embarrass them in the discharge of their onerous duties, and by compromising their neutrality would materially impair, if not destroy, that confidence heretofore reposed in them by all classes of the public."—On Monday, the weekly meeting of the Repeal Association took place, Mr. Honan, ex-Mayor of Limerick, in the chair. A letter was read from Mr. O'Connell, counselling peace during the State trials, and assuring the people of the ultimate triumph of their cause. The rent for the week was 904*l.*

SCOTLAND.

Edinburgh.—By appointment of the Free Church Assembly's commission Dr. Burns left last week on a mission to the United States in behalf of the Free Church. He goes out to America as a companion to Dr. Cunningham, for the purpose of explaining the position of the Free Church and for collecting funds for its support. It is said to be the intention of this deputation to continue in America for about four months, and not to return sooner than for the sitting of the Free Assembly in May next.—There are now four candidates for the vacant musical professorship in this University—Mr. Donaldson, Mr. W. S. Bennett, Dr. Gauntlett, and Mr. Mainzer.—For some time back workmen belonging to the Duke of Hamilton have been employed boring for coal at Brightons, in the vicinity of the Polmont station on the Edinburgh and Glasgow Railway. Their labours have been rewarded by the discovery of a seam of coal of considerable thickness which extends to upwards of 3000 acres. In sinking the trial-pit considerable difficulty was experienced, as, in addition to the other obstructions, such as ironstone, &c., a rock of a peculiarly hard nature was gone through upwards of 30 feet thick. The coal has been burned in a small gas-work, and from the quality of the light it is said to be a first-rate household coal.—The trial of Mrs. Gilmour, who was recently brought from America under the new treaty for the murder of her husband by poison, took place on Friday and Saturday. The facts that Mr. Gilmour died from the effects of arsenic—that the prisoner and her husband lived unhappily together, &c. were fully proved. The interest excited by the trial surpassed anything witnessed since that of the Glasgow cotton-spinners in January 1838, the Court itself and all the avenues leading to it being densely crowded. In the Parliament-square hundreds were to be seen coming and going, anxiously inquiring as to the progress. Mrs. Gilmour was dressed in deep mourning, and when she took her place in the dock her face was entirely covered from the general view of the spectators by a large thick crape veil, which she partially raised when seated at the bar. The trial was concluded on Saturday. The jury after an absence of about an hour returned with the following verdict:—The jury after a careful and mature consideration of the evidence brought before them in this case, are unanimously of opinion that John Gilmour died from the effects of arsenic: but find it not proven against the prisoner at the bar as libelled. This announcement was followed by very decided expressions of approval by those in Court, which were rebuked by the Lord Justice Clerk, who ordered the prisoner to be discharged.—On Thursday night a League Meeting took place in Edinburgh, the principal speakers being the deputation from the League who appeared at Glasgow on the previous day. There were according to a local journal no fewer than 31 Dissenting Ministers in attendance. The Lord Provost was in the chair. Mr. Cobden occupied nearly the whole evening in an address, and resolutions in support of the League were unanimously carried.—Information reached the superintendent of the Edinburgh police about a week ago that a young lady of rank had been missing from her family in Ireland, and had proceeded to Edinburgh, having in her possession a considerable sum of money. The superintendent instantly made a personal inquiry into the matter, accompanied by a gentleman from Ireland, and on Wednesday evening succeeded in tracing the young lady to a respectable lodging-house in one of the squares. She gave up 426*l.*, and was then removed to a hotel in the neighbourhood, and proceeded the following day in company of her female friend and the gentleman above noticed to Glasgow, on her way back to her friends in Ireland, who have naturally been in great grief at the step which the young lady had pursued.

Glasgow.—On Wednesday night the deputation from the Anti Corn-law League consisting of Messrs. Cobden and Bright, Colonel Thompson and Mr. Moore were entertained at a banquet in the City Hall. The hall was completely filled, there being about 3000 persons present. One of the galleries was set apart for the ladies who seemed to take great interest in the proceedings. The Lord Provost was in the chair. Mr. Fox Maule, M.P., proposed "the Principles of Free Trade, and the Lord Provost gave the "Health of the Deputation." Mr. Cobden, Mr. Bright and Col. Thompson afterwards addressed the meeting at some length in behalf of the League.

Cromarty.—On Wednesday and Thursday last the Ross-shire rioters were put on their trial in the Justiciary Court. There were three convictions, two of the convicted were sentenced to six, and one to nine months' imprisonment.

Haddington.—A requisition signed by 227 of the "noblemen, gentlemen, commissioners of supply, justices of the peace, tenant-farmers, and others connected with the county of Haddington," has been addressed to Lord Elcho, Vice-Lieutenant of the county, requesting his Lordship to call a public meeting of those favourable to protection to agriculture. The requisition contains the names of the Earls of Wemyss and Lauderdale, Lord Ruthven, Lord Blantyre, Sir Thomas Hepburne, M.P., Mr. Balfour, M.P., &c. The meeting is to be held on Friday the 19th, and has for its object a petition to Parliament against any further change in the Corn-laws, and the establishment of an Association for the Protection of Agriculture.

Law.

ROLLS' COURT.—*The Duke of Brunswick* v. *the King of Hanover.*—Lord Langdale gave judgment in this case, which occupied the attention of the Court for several days during last term, and observed that it came before the Court upon demurrer for want of equity and for want of jurisdiction. The bill was filed by the Duke of Brunswick against the King of Hanover, who was described as Duke of Cumberland and Tiviotdale and Earl of Armagh in Ireland; and the bill prayed that an instrument dated February 6 and March 14, 1833, the first being the date of execution in England and the second in Brunswick, appointing a guardian of the person and estates of Duke Charles of Brunswick, might be declared void, and for an account of the rents, profits, and produce of the estates which had come to his hands or been received by any person for his use by virtue of the instrument, including the personal estate and also the rents and profits of the real estate, which had been received by the Duke of Cambridge, the plaintiff offering to make all just allowances. In 1830 the plaintiff was Duke of Brunswick, and he was entitled to real and personal property in England, France, Brunswick, and Hanover. At that time his late Majesty William IV. was King of Hanover, which was governed by the Duke of Cambridge as his viceroy. In this year a revolutionary movement took place against the government of Duke Charles, and on the 2d of December, 1830, William, now reigning Duke of Brunswick, was invited to take upon himself the government of the duchy provisionally, and in February, 1831, the King of Hanover caused a declaration to be published, that the throne had passed to Duke William; this was sanctioned by the Duke of Cumberland and also by the Duke of Sussex. In 1833 the instrument in question was signed by his Majesty William IV. as King of Hanover, and by William Duke of Brunswick, stating that "We being moved by the interest of our house, and yielding to a painful necessity, think it necessary to consider what measures the interests of our house rightly understood (the Duke of Brunswick) may require. The powers of supreme guardianship over the princes of the empire after the dissolution of the German empire devolved to the heads of sovereign states. We have therefore decreed that we have arrived at the conviction, that Duke Charles is at this time wasting the fortune which he possesses in enterprises alike impossible and dangerous both to himself and other persons, in seeking to damage the just claims which certain persons interested now and hereafter may legally have upon this property. We have considered that the only method of preserving the fortune of Duke Charles from ruin is to appoint a guardian over him. We decree that the Duke of Brunswick should have a guardian over him, and that the guardian should be chosen from amongst the noble male scions of our house. That his Royal Highness the Duke of Cambridge, as Viceroy of Hanover, shall be guardian, and having accepted the guardianship that he should be empowered to take upon himself the duties." This instrument was signed by the Dukes of Cambridge and Sussex. His Lordship then stated the whole of the plaintiff's bill, and that the guardianship was on the death of his Majesty given up to the Duke of Cumberland, who became King of Hanover. It has been argued that the appearance entered by the King of Hanover was an admission that he could be sued, and that the refusal of the Lord Chancellor to discharge the letters missive was a decision that the defendant was liable to be sued. An appearance had been considered as a waiver of objection to the jurisdiction; but it was not so here. The defendant claimed an exemption from being sued, and his appearance was only for the purpose of having that claim considered. It did not seem therefore that any opinion had been given upon the jurisdiction. The plaintiff admitted the defendant to be King of Hanover, and as a sovereign prince, not liable to be sued; that the inviolability attended him everywhere; that it was not altered by his being resident here, or by his being also sovereign prince and subject. It was also said that if he was liable to be sued in this country, still he ought not to be sued here in respect of matters of state in his own country; and assuming that he could be sued here, yet the present was not matter over which this court had any jurisdiction, since it could only be considered in a court of special jurisdiction, similar to those appointed to decide cases of lunacy, &c., and adjudicated upon in those courts upon the special circumstances. The present case did not appear to be one between subject and subject. The plaintiff was domiciled here and the defendant was born here, and had taken the oath of allegiance as an English subject; but this made no difference, as it did not render him liable to be sued in the courts here. The Queen of England could be sued in the courts here, and it was not admissible that a foreign sovereign should be wholly exempt; if that were so he would be in a better situation than the Queen, which would be absurd. The general proposition stated was that a sovereign prince was exempt from the jurisdiction of the courts here; but there was also a limited proposition, which was that he was exempt for acts done by authority in a foreign country and independent of his character as Duke of Cumberland. Supposing a foreign prince to sue in the courts here, he subjected himself to the jurisdiction of the court, and if he was sued and submitted he was bound to put in his answer, and upon his personal oath. The refusal of his right to sue might possibly be a just cause of war; but if he does sue he must submit to the jurisdiction. His Lordship then referred to the protection to which ambassadors are entitled, and said that an argument had been founded on it, that if the ambassador was protected protection could not be refused to the Prince himself, from whom alone he obtained the right to exemption. It certainly was right that the person of an ambassador should be inviolable, and so ought the person of a sovereign prince; but the plaintiff insisted that the reason of the law should be looked to. The ambassador was accredited here on special business, but it could not even in this case be inferred that he was exempt in all cases; there certainly was no English law applicable to the subject, but if there was any general law of nations upon the point, it was a part of the common law of England. In the absence of adjudged cases reason was the only guide; a remedy might be afforded here for acts done out of the country; and arrest for debt had been allowed, but that was not allowed now in the case of ambassadors. In the absence of positive law and usage it was reasonable to borrow light from analogous cases, though they might not be satisfactory; but if you exonerated the Prince himself and refused to do justice on the ground of his inviolability, war might be the consequence. Such cases were always pressed by this, but it was the last resort, and war and reprisals were sanctioned

by the law of nations; and if circumstances gave the country a command over the property of the Prince, and that power was used to enforce obedience, it was still considered as an hostile aggression. On the other hand, a state might seek redress for an injured subject. This might be followed by refusal and the result again was war. It became therefore a question of what was to be done where a court had power to enforce its orders where there was property and the offender was a sovereign prince; and it seemed that it ought to be treated as a cause of war, instead of a violation of the laws of the country and an attempt to bring him to justice in the courts of ordinary jurisdiction. The case of the defendant was not modified by his being a subject of the Queen of England. Before he became King of Hanover he gave in his allegiance, and this had since been renewed and he had claimed and exercised his right as a peer. It could not therefore be said that he was exempt from the jurisdiction. The law admitted the inviolability of his character as king, but left him responsible on other grounds; he could not be considered inviolable as a legal adviser of the Queen, other ministers might be impeached, and great difficulty might arise from the union of the two characters of king and subject. It did not seem that there could be any complaint if the defendant was compelled to account for the acts done by him as a subject. The King was exempt from being sued for acts done as a king, but as a subject of the Queen he was liable for acts done as a subject, and also in respect of acts done out of the realm, but as against the public his acts must be attributed to his character of sovereign instead of that of subject; and it ought in cases similar to this clearly to be shown that a sovereign prince ought not to be sued as a subject. In this case it did not seem that this was a question between subject and subject, neither did it appear that the instrument could be impeached: it was alleged to be null and void, but the allegation was too vague. The instrument was not one of policy, but was stated to have arisen out of the revolution. He should be inclined to consider it as a state document, but it was not necessary to consider that point; the question was whether the Court had jurisdiction which made the defendant liable to the process of the Court. He thought it had; but the acts for which he was sued were not such for which he could be sued, and therefore the demurrer must be allowed.

Richardson v. *Hastings*.—This cause came on upon demurrer. The plaintiff Charles Richardson filed the bill on behalf of himself and all others (excepting the defendants) who were at its dissolution members of "The Alliance Club," against Edward Hastings and Henry Emly, and the prayer was for an account of the sale of furniture comprised in a deed of the 27th of January, 1838, and for payment to the plaintiff as trustee, and also for an account of the sale of the wines, books, and effects of the Club, and of the subscriptions of the members in the defendant's hands. The bill stated that in 1836 the defendants agreed with Messrs. Tubbs, Stewart, and others, to form a club under the name of "The Alliance Club," and in February, 1837, they procured the lease of a house in Pall-mall to be granted to Hastings, Stewart, and Tubbs, as trustees for the Club. These trustees in March, 1837, entered into an agreement with Hodgkinson for the hire of furniture for the Club, and in the following April the house was opened for the Club, which consisted of 100 members, and Chapman was appointed the Steward. Rules were made, and a deed executed by the plaintiff and twenty-one other members, and the hired furniture was purchased. Tubbs retiring, the lease was surrendered, and a new one granted in March 1838 to Hastings, Stewart, and Emly, at a rent of 450*l*. The affairs of the Club became embarrassed, and in June 1838, Dobson the auditor of the accounts, prepared a statement by which the liabilities were 1,340*l*. At a meeting on the 10th of May, 1839, it was stated that a contribution of 13*l*. from each member would meet the liabilities, and a resolution for payment thereof was passed, and for selling and winding up the affairs. The plaintiff with sixty-seven other members, paid their 13*l*. into the bank of Messrs. Hopkinson, and a committee advertised the lease and good-will of the Club-house for sale. The bill then stated that the defendants took upon themselves to act according to their own view, entered into a contract to sell the lease to William Mason, and without consulting the plaintiff, who was trustee, sold the furniture to Mason, denying the plaintiff's right to interfere, and received upwards of 1,200*l*., but the plaintiff had not been able to obtain an account. In November, 1839, the defendants took possession of the accounts, and disposed of the other property of the Club. The defendants demurred for want of equity, and also for want of parties. For the plaintiffs it was urged, that the impossibility of making all the members of the Club parties was so great as to amount practically to a decision that the suit could not proceed. Lord Langdale overruled the demurrer for want of equity, but allowed it for want of parties.

POLICE.—We stated in our last that on Wednesday night Daniel Forrester the officer apprehended the wife of a shopkeeper who carries on business in Oxford-street, upon a warrant granted by the Lord Mayor, on the charge of having been concerned in the late forgeries of wills. On Friday the prisoner, who turns out to be a Mrs. Georgiana Dorey, was brought up to be examined as to her personal identity, previously to the day appointed for the hearing of further evidence against Messrs. Barber and Fletcher, when she will be placed at the bar with those individuals, and the whole of the transactions will be gone into. Mr. Cotton the governor and Mr. Heath deputy-governor of the Bank of England, were among the gentlemen present during the proceedings. Mr. Clarkson stated that he was unexpectedly called upon to appear before his Lordship, in consequence of a fresh result of the inquiries which had been made, with a view to bring all the parties who were engaged in the transactions he had already described, as regarded Barber and Fletcher, to a condition of responsibility. In the course of the inquiries made by the officers, it was ascertained that a woman who had resided in Bristol, and was supposed to be concerned in the transactions alluded to in a very essential manner, was residing at No. 45, Oxford street, with her husband, Mr. Dorey, who kept a shop for the sale of ready-made mourning; and Daniel Forrester went thither, provided with two witnesses, who upon seeing the prisoner in the shop identified her as the person who had hired the lodging at No. 7, Francis-street, Tottenham-court-road, for the Emma Slack who was represented in the alleged will of Ann Slack as the executrix and sole legatee of that lady. The prisoner used some words of indignant denial and menace upon hearing the accusation, but the witnesses were the more confirmed in the opinion they had formed as to her identity when they heard her speak and saw her more closely. Forrester accordingly took her into custody, and subsequently additional matters came out which gave still greater strength to the belief that she was not only one of those who had accomplished the fraud in the case of Miss Slack, but raised a very strong suspicion that she had also lent a hand in the affair of the will of Eliza Burchard, the last case which had been brought before his Lordship. The vigilant officer, after having deposited his prisoner in the Compter, went to Mr. Dorey's house, supposing that he might, in searching amongst the prisoner's property, find something calculated to throw additional light upon the subject of the frauds. Mr. Dorey, it was proper to observe, gave every possible facility to the officer, who found in a box in the prisoner's room a small seal, the production of which would be a most important feature in the investigation. The prisoner was the sister of a woman who was married to a Mr. Sanders, who formerly resided at Bristol, but who had, together with his wife, withdrawn to some place to which they had not as yet been traced. There was ground for supposing that the parties who had thus disappeared from the time that publicity was given to these proceedings, were implicated in no slight degree in the business to which so much public interest had been attracted.—Daniel Forrester was then sworn. He said,—In consequence of information which I received I applied for a warrant on Wednesday last against the prisoner, and accompanied Mr. Weare, a gentleman in Mr. Freshfield's office, to Oxford-street, where Mr. Dorey, the prisoner's husband, resides. Mrs. Neville, and her daughter, Miss Neville, who reside at No. 7, Francis-street, Tottenham-court-road, were in a cab in the neighbourhood of the house, and by a previous arrangement Miss Neville went in and succeeded in seeing the lady of the house on the pretence of purchasing some black silk. Miss Neville intimated to me that the prisoner was the person who took lodgings in their house for Miss Slack. I then told the prisoner that she was charged with being the person who took lodgings for Emma Slack or Miss Slack. She did not deny it at first, but she said, "At your peril say so." Mrs. Neville then came into the shop and saw the prisoner. I did not exactly hear what she said at first, but afterwards she said she was convinced the prisoner was the person who took the lodgings. I said I was obliged to take her into custody. Afterwards Mr. Dorey came into the shop, but the matter was not explained to him for some time. He evidently understood nothing about it, and he said to us, "What can I do for you?" I made no answer, but the prisoner said, "The lady has been looking at some silk, but she don't want it." I remained silent, and so did the prisoner for some minutes, and Mr. Dorey kept looking at one and then at the other. The prisoner then said, "The lady says I had taken some lodgings." I said to the prisoner, "I thought you would have explained to Mr. Dorey," and she replied, "No, I would rather you should explain to him;" and I then told him that Mrs. Dorey was charged with having taken a lodging for Miss Slack in Francis street, Tottenham court Road. After some further conversation we went up stairs, and Mr. Weare put several questions to the prisoner, and asked her whether she had any objection to write. Mrs. and Miss Neville were thus enabled to hear her speak a good deal, and they declared that they were convinced she was the person they had described her to be. I communicated to Mrs. Dorey that it was my duty to take her before the Lord Mayor. I said to Mr. Dorey, "Where is the woollen cloak with the bar on it?" The prisoner directly replied, that it was in Mary's (the servant girl's) room. Mr. Dorey then, instead of going into Mary's room, went into the prisoner's room, and fetched out a dark blue cloak with a dark bar on it. (Here the officer produced a dark cross-barred cloak.) I went into Mary's room, but the cloak in her room was not at all like this. I produced this to Mrs. and Miss Neville and they said it was the description of cloak which was worn by the lady who took the lodging for Miss Slack. After I had taken the prisoner to the Mansion-house and disposed of her securely, I returned to the house of Mr. Dorey for the purpose of making a search. I accompanied Mr. Weare. I found this seal in a box which lay open in the prisoner's room, and which box Mr. Dorey said was his. I do not know whether Mr. Weare or I picked it up. I have had it in my possession ever since. Mr. Clarkson here stated that the seal, which represented a small hand with the fingers held upward, exactly fitted the impression made upon the wax with which the will of Eliza Burchard was sealed. The Lord Mayor compared the impression with the seal, and found that they exactly corresponded. The Lord Mayor asked whether the prisoner had any legal adviser to conduct her case? The prisoner said in a very faint voice that she expected an attorney to attend for her, but she apprehended he was in the country. The Lord Mayor—I wish you to have every legal assistance you may consider necessary, and I shall, if you wish it, at once adjourn this examination, to give you an opportunity of procuring the aid of professional men. Mr. Clarkson said he had no desire at all to proceed without giving the prisoner every possible means of defending herself under circumstances of so serious a character. Mrs. and Miss Neville were then examined, and identified the prisoner as the person who took the lodgings in Francis-street for Emma Slack. The prisoner was then remanded till Monday week, when a vast body of evidence will, it is expected, be produced against the three individuals charged with these extraordinary offences. In reference to this subject it appears that Mrs. Dorey was in 1834 before the public as plaintiff, in the Court of Exchequer, in an action of damages for breach of promise of marriage. At that period she was Miss Georgiana Richards, and the person against whom she brought the action was the "Rev." Robert Taylor, the then notorious lecturer on infidelity. The damages were laid at 2,000*l*. Miss Richards had also a political acquaintance with Mr. Richard Carlile, the infidel writer, about sixteen years ago. She was then living with her mother and her married sister, Mrs. Sanders, at Bath, as a milliner, and was considered a person of very extraordinary abilities. Three or four years afterwards she came to London, accompanied by her mother, and as the family had embarrassments to contend with, she accepted the situation of housekeeper at the Rotunda, on the Surrey side of Blackfriars Bridge, where the Rev. Robert Taylor was in the habit of lecturing in that building. At the trial she instituted against him the jury awarded her damages to the amount of 250*l*., and the principal witnesses examined upon the occasion were Joshua Fletcher, the same person who stands charged with Mr. Barber and herself as confederates in the alleged frauds upon the Government, and Mr. and Mrs. Sanders, her brother-in law and sister, whose presence is now so much required at the Mansion House.

SPORTING.

TATTERSALL'S, THURSDAY.—DERBY.—300 to 100 agst The Ugly Buck and Rattan (taken); 18 to 1 agst Lord Maidstone's Cockamaroo; 20 to 1 agst Mr. Lichtwald's Leander; 25 to 1 agst Colonel Peel's Orlando (taken to 50*l*.); 25 to 1 agst Colonel Peel's Ionian (taken to 30*l*., and afterwards offered); 25 to 1 agst Mr. A. Wood's Running Rein (taken to 50*l*.); 1000 to 25 agst Mr. Bowes's Saddle-Bow (taken); 1000 to 25 agst Sir G. Heathcote's Companero (taken, and afterwards offered); 50 to 1 agst Mr. St. Paul's Telemachus (take 1000 to 15); 1000 to 15 agst Mr. Thornhill's Apprentice (taken several times.)——ST. LEGER.—1000 even on the field agst the following seven:—Rattan, The Ugly Buck, Leander, The Princess, Foig-a-ballagh, Zenobia, and The Cure. 600 to 400 was afterwards betted on the field agst the same lot. 100 even laid between the Vat colt and The Cure.

BIRTHS.—On 21st June, at Wellington, New Zealand, the wife of I. E. Featherston, Esq., M.D., of a daughter.—On 3d inst., at Burton-hill, Malmesbury, the Lady of the Rev. C. Pitt, of a son.—On 7th inst, at the Rectory, Meppershall, Bedfordshire, the lady of the Rev. H. Howarth, of a still-born son.—On 9th inst., at Wootton Rectory, near Northampton, the wife of the Rev. I. PRIDEAUX LIGHTFOOT, of a son.—On 10th inst., at Langford Grove, the Rt. Hon. Lady RAYLEIGH, of a son.—On 12th inst., at Harwich, the lady of Lieut. CREYKE, R.N., of a son.—On 13th inst., the wife of E. S. STEPHENSON, Esq., of Great Queen-street, St. James's Park, of a son.—On 14th inst., the wife of W. GRESHAM, Esq., of Castle-street, Holborn, and of No. 42, Notting hill-square, Kensington, of a son.—On 15th inst., in Devonshire-terrace, Mrs. C. DICKENS, of a son.—On 16th inst., at 59, Upper Seymour-st., the Hon. Lady DALLAS, of a daughter.—On 16th inst., at Crowle Vicarage, Lincolnshire, the lady of the Rev. B. J. ARMSTRONG, of a daughter.

MARRIAGES.—On Tuesday, Jan. 16, at Holme Pierrepoint, Notts, R. H. W. MILES, son of P. J. Miles, Esq., of Leight Court, Somersetsh., to MARY ELLEN, eldest daughter of the Rev. J. J. Cleaver, Rector of Holme Pierrepoint.—18th inst., WILLIAM, son of G. Dunlop, Esq., of Edinburgh, to MARION MOFFAT, daughter of W. Burnie, Esq.—18th inst., COL. H. P. DAVISON, of Swarland Park, Northumberland, to the Hon. CAROLINE NORTH GRAVES, second daughter of the late, and sister of the present, Lord Graves.—4th Nov., 1843, at Cawnpóre, J. SIBLEY, Esq., 54th Reg. N.I., to MARGARET, eldest daughter of Gen. Boyd.—16th ult., at Gibraltar, FERDINAND SCHOTT, Esq., Consul for the free city of Frankfort, to CAROLINA, eldest daughter of Pablo Larios, Esq.—13th inst., DAVID LLOYD, youngest son of the late Rev. SWEENEY, Albion-place, Hyde-park-square, apothecary—H. and J. SLESINGER, Cateaton-street, city, warehousemen—E. HOBSON, Thurston, Northamptonshire, linendraper—W. BAKER, Lower Grosvenor-st., Bond-street, surgeon—J. C. KNILL, Gloucester, tailor—G. PHILLIPS, Leeds, innkeeper—J. REAVELEY, Queenhithe, City, paper commission agent—T. BEARUP, Newcastle-upon-Tyne, joiner—W. LEWIS, Jun., Axbridge, Somersetshire, baker—T. BENTLEY, Eccleston, Lancashire, calico-printer.

SCOTCH SEQUESTRATIONS.—A. MACKAY, Musselburgh, merchant—J. CAIRNS, Kippendavie, Perthshire, farmer—W. BROWN, Troon, merchant—C. BLAIR, Alloa, maltster.

WANTED IMMEDIATELY, a steady, active Man in the PROPAGATING DEPARTMENT.—Apply to J. RIGBY, Stanhope Nursery, Gloucester-road, Old Brompton. Jan. 17, 1844.

WANT PLACES.—All Letters to be post-paid.

AS GARDENER.—A single Man; has no objection to look after a horse and chaise and make himself useful. Can have a good character of 2 years and 8 months from his last place. No objection to town or country.—Direct to Mr. Ivin, Wimbledon, Surrey.

AS GARDENER.—A married Man, aged 35, without incumbrance, who thoroughly understands his business, can take charge of Land and Stock, if required. Can have 5 years' character, and be strongly recommended by the gentleman he has just left.—Direct to J. D., 24, Sackville-street, Piccadilly.

AS GARDENER.—An industrious married Man, aged 28, who is perfect master of every branch of Gardening, including Pines, early forcing of Grapes, &c., and general care of Hot and Greenhouses, Kitchen and Flower-gardens, and care of Meadow-land; his wife would act as housekeeper or live in a lodge. Can get unexceptionable character.—Direct H. C. Post Office, Mare-street, Hackney.

AS GARDENER, where one or more men are kept.—A young Man, aged 35, who perfectly understands Forcing, Kitchen, Fruit, and Flower Gardening, and has a Practical knowledge of the cultivation of Plants; has no objection to take charge of land, and can have an unexceptionable character from the Gentleman he has lived with 4½ years.—Direct to W. Y., at Mr. PAMPLIN'S Nursery, Hornsey-road, Islington.

TO SEEDSMEN, &c.

AS SECOND WAREHOUSEMAN.—A Young Man, 25 Years of Age, is desirous of obtaining a Situation as above, or to assist in the Shop if required. He can be well recommended by his present employer, with whom he has been two years.—Direct to A. B., at Messrs. RONALDS', New Brentford, Middlesex.

TO NOBLEMEN AND GENTLEMEN.

AS LAND-AGENT.—A thoroughly experienced Practical Agriculturist, who has long had the management of extensive property in one of the first Agricultural districts in Scotland, and who will shortly leave his present charge from unavoidable circumstances. For character and practical ability the most satisfactory references will be given.—Address to A. B., Mr. CUTHBERT'S Seed Warehouse, 12, Clayton-square, Liverpool.

AS FOREMAN.—A Man of talent and ability, who has carried on an extensive Business in the Nursery and Seed Trade, is desirous to engage himself as Foreman, or to conduct the business of a general Nursery. He has a thorough practical knowledge of the Trade in its various branches, as a first-rate Propagator, and a good Salesman. Apply to A.Z., at Mr. W. BRISTOW'S, Seedsman, Knightsbridge, London.

TO LANDED PROPRIETORS.—A young person of the highest respectability is desirous of obtaining a Situation as AGENT to a Nobleman or Landed Proprietor. He has been four years with a gentleman who has extensive estates under his management, and is, therefore, well qualified to undertake the duties of such a Situation.—Apply to J. C. M., at the *Agricultural Gazette* Office.

GARDENERS' BENEVOLENT INSTITUTION.—At a special General Meeting of the Subscribers to this Institution, held on Thursday, Jan. 11, at the Crown and Anchor Tavern, for the special purpose of Electing Two poor persons on the Pension List of this Charity, the following was the result of the Ballot, viz.:—

James Anderson	aged 72		174 votes.
Ann Potter	62		140
Elizabeth Collyer	69		30
Samuel Linwood	65		22
John Blaylock	71		16

The Meeting then declared that James Anderson and Ann Potter, having the greatest number of votes, were duly elected Pensioners of this Charity. Edw. R. Cutler, Sec.

THE LATE Mr. LOUDON.—A Public Meeting of the Friends of the late Mr. Loudon will be held in the large room of the Horticultural Society's Establishment, Regent-street, London, early in February next, to consider the best means of extricating his Widow and Daughter from the difficulties into which they are placed by Mr. Loudon's sudden death.

Notice will be given next week of the day of meeting, when it is hoped that noblemen and gentlemen who patronise Horticulture, and also all Gardeners and Nurserymen who are within a reasonable distance, will attend.

AT a very numerous Meeting of Tenant Farmers, of the Three Hundreds of Newport, in the County of Buckingham, held at the Swan Hotel, Newport Pagnell, on the 10th day of January, 1844, for the purpose of forming an Association for the Protection of Agriculture,

Mr. Edmund Greaves in the Chair.

It was Resolved—First—That this Meeting participates in the now almost universal feeling of abhorrence excited by the false and insidious statements and opinions put forth by the Anti-Corn Law League, a conspiracy whose aim is to obtain Free Trade in Corn, but to preserve the protection enjoyed by the manufacturer.

Second—That this Meeting is impressed with the conviction, that the protection afforded to Agriculture by the existing laws is not more than an equivalent for the burdens imposed upon the land—that Free Trade in Corn is a delusion which would reduce to a state of beggary and want all who have invested their capital in farming operations—bring desolation and misery on the Agricultural labourer—prove destructive to the landed interest of the country—materially injure the tradesman and mechanic, and ultimately involve in one common ruin all classes of society, including the blinded advocates of so infatuated a scheme.

Third—That this Meeting pledges itself to adopt all constitutional measures for opposing the Anti-Corn Law League, and resisting any attempt to weaken the protection at present extended to Agricultural produce.

Fourth—That a Committee be appointed for carrying into effect the foregoing resolutions and to co-operate with any Central Society which may be formed in the County or in London, in such manner as may be considered most beneficial; and that such Committee be composed of the gentlemen whose names are attached to the requisition convening this meeting, with power to add to their numbers, five to form a quorum.

Fifth—That a subscription be now raised and placed at the disposal of the Committee. E. Greaves, Chairman.

At a Meeting of the Committee, held at the Swan Hotel, Newport Pagnell, on the 19th of Jan., Mr. Greaves in the Chair.

It was Ordered—That the Resolutions of the meeting of the 10th instant be advertized.

It was Resolved—That every effort be made by the Committee to increase the funds of the Association, by soliciting subscriptions from the landowners, tenants, tradesmen, and others.

That a petition to both Houses of Parliament, founded upon the resolutions of the 10th instant, be drawn up and submitted to the Committee at its next meeting.

That W. Powell, of Newport Pagnell, Esq., be requested to accept the office of Honorary Secretary and Treasurer to the Association. E. Greaves, Chairman.

TO GENTLEMEN and AMATEUR FLORISTS.—As the return of spring is fast approaching so is the planting of that beautiful flower the RANUNCULUS. A few hundred roots to be parted with (with names), and a single root of the very high coloured purple flower "Quixos," will be included in each hundred roots; the time of planting February and March.—Apply, pre-paid, to Mr. Eyre, Farnham, Surrey, where may be seen, in the blooming season, in Mr. Eyre's Collection of PELARGONIUMS, some Seedlings and other specimens of this most delightful, still-improving flower.—Farnham, Surrey, Jan. 22.

FASTOLFF RASPBERRY.

PATRONISED BY HER MOST GRACIOUS MAJESTY THE QUEEN, HIS GRACE THE DUKE OF RUTLAND, THE MOST NOBLE THE MARQUIS OF AILSA, THE EARL OF HARRINGTON, THE EARL OF LIVERPOOL, THE LORD BISHOP OF LONDON, LORD VISCOUNT LORTON, LORD SONDES, &c. &c.; as well as by the HORTICULTURAL SOCIETY OF LONDON.

YOUELL and Co. have much pleasure in announcing they are now supplying fine Canes of the above highly valuable and much esteemed RASPBERRY, unequalled for the extraordinary size of its fruit and richness of flavour.

Those to whom Y. and Co. sent it last season have expressed their high admiration of its superiority over all other varieties, and has been awarded several prizes at various Horticultural exhibitions during the season. As a proof they have not exaggerated its excellent qualities, fruit was submitted to Dr. Lindley (see *Gardeners' Chronicle* of the 22d July last, page 502), whose opinion of it is as follows:—

"Fastolff Raspberry.—We have received from Messrs. Youell, of Great Yarmouth, fruit of the Fastolff Raspberry, and we find it merits all that has been stated in favour of its excellence. The fruit that we have received is very large, obtusely conical, and of rich flavour, far exceeding in this respect some other new and large varieties. The plants bear abundantly and in long succession."

They also exhibited it on the 1st of August, 1843, before the London Horticultural Society, 21, Regent-street, to which a prize was awarded. It would therefore be unnecessary for Youell and Co. to recommend it more fully, or with greater confidence, to the notice of the public, merely observing, that it continues in high perfection throughout the autumnal months, and has maintained its superiority in the most unfavourable soils and situations, and requires no other than the ordinary treatment of the old varieties.

Fine Canes are ready for delivery, and can be sent with safety to any part of the United Kingdom (on the receipt of a Post-office order), upon the following terms:—

Packages containing 100 Canes		£2	5*s*. 0*d*.
Do.	do. 50 do.	1	5 0
Do.	do. 25 do.	0	14 0

Package included.

The usual discount to the Trade, when not less than 200 are ordered.

*** Caution.—Y. and Co. beg to call the attention of their Friends and the Public in general to the fact that they have appointed no Agents in London for the sale of the above, and cannot be held responsible for its being genuine, unless purchased direct from their Nursery.

YOUELL'S TOBOLSK RHUBARB, Patronised by Her Most Gracious Majesty the Queen, and many of the Nobility, 12*s*. per dozen.—For particulars of which see their Advertisement of the 18th November.

TWO NEW SEEDLING PICOTEES.—"Lady Alice Peel," 10*s*. 6*d*., and "Mrs. Benyon," 10*s*. 6*d*. per pair.—These two splendid Picotees were raised by the Rev. J. Burroughes, of Lingwood Lodge, Norfolk, and kindly presented by that gentleman to Messrs. Youell and Co., for particulars of which see their Advertisement in this Paper of the 16th of Sept.

FINEST CARNATIONS and PICOTEES.

YOUELL and CO. beg to refer the readers of the *Gardeners' Chronicle* to their Extensive List, with Prices, of the above highly-esteemed Flowers, which appeared on the Advertising pages, 706 and 707, of this Paper, of October the 14th, and will be found to contain every variety worthy of cultivation.

Prices as follows:—				£	*s*.	*d*.
12 pair of good Show Sorts	..	..	..	1	4	0
12 ditto fine ditto	..	..	..	1	10	0
25 ditto ditto	..	..	..	3	0	0
12 ditto extra fine and very superior ditto			..	2	10	0
25 ditto ditto	ditto		..	5	0	0

The selection being left to Youell and Co.

FUCHSIAS.

1 dozen of the newest and very best sorts	.. 21*s*.
1 dozen fine ditto	.. 12*s*.
1 dozen good show varieties	.. 8*s*.

Sent by post, free, to any part of the United Kingdom.

ARAUCARIA IMBRICATA.

YOUELL and CO., possessing the most extensive stock in the country of the above Splendid Hardy Ornamental Tree, beg to offer them on the following advantageous terms:—Fine robust 4-year-old plants, 8 to 9 inches high, 10*l*. per 100, or 30*s*. per dozen.—Great Yarmouth Nursery, Jan. 24, 1844.

FUCHSIA SEED.

YOUELL and CO. beg to inform their [illegible] the Public they have succeeded in saving [illegible] of the above from the very newest and best varieties, and offer upon the following terms:—

A packet containing 100 seeds		5*s*.
Do.	do. 50 do.	3*s*.

Sent post free on the receipt of a Post-office order. Directions for sowing, &c. will accompany each packet.

This will form an admirable opportunity to those who intend competing for Seedling Prizes at the exhibitions of the present year. The quantities being very limited, early application will be necessary.—Great Yarmouth Nursery, Jan. 25, 1844.

MARNOCK and MANLEY'S CATALOGUE of NEW and CHOICE FLOWER-SEEDS, with full and particular Directions for the best Modes of Cultivation, with the Treatise on the Walcheren Cauliflower is now ready, and may be had on application.

Their Stock of trained Fruit-trees are exceedingly fine, consisting of all the leading varieties of Peaches, Nectarines, Apricots, Plums, &c. Also the following Cherries:—Harrison's Heart, Black Heart, Adam's Crown, Waterloo, Knight's Early Black, Florence, Black Eagle, Downton, Late Duke, May Duke, Bigarreau, Elton Napoleon, Early Purple, Circassian, Kentish, Morello of sorts, &c. Prices may be had on application at their Nursery, Hackney, London.—Jan. 25, 1844.

RANUNCULUSES, ANEMONES, CARNATIONS, AURICULAS, and LILIUM LANCIFOLIUM.

H. GROOM, Clapham-rise, near London (removed from Walworth), by appointment Florist to her Majesty, begs to remind the Nobility, Gentry, and Amateurs, that this is the best season for obtaining Collections of the above Flowers, and that in consequence of the success he had in their cultivation last year, he can offer them at the following moderate prices:—

	£	*s*.	*d*.
100 Ranunculuses in 100 superb sorts with names	4	4	0
100 do. in 100 very fine sorts, do.	2	10	0
Superfine mixtures, from 7*s*. to 21*s*. per 100.			
100 Anemones in 100 superfine sorts, with names	2	10	0
100 Do. in 50 do. do. do.	2	0	0
Superfine mixtures, 10*s* per 100.			
25 pair of Carnations, in 25 superfine sorts, with names	3	10	0
25 pair of Picotees, in 25 do. do. do.	2	10	0
25 Auriculas, in 25 superfine sorts, with names	3	13	6
Lilium lancifolium album, good bulbs, each	0	3	6
" " " large bulbs, each	0	10	6
" " " punctatum, good bulbs, each	0	7	6
" " " large bulbs, each	1	1	0

Catalogues may be had on application.—Jan., 1844.

TO GENTLEMEN PLANTING.

J. and J. FAIRBAIRN are induced from the uncertainty upon which they hold the Manor-street Nursery (situated contiguous to the Home Nursery, Clapham Rise, where attention will be given to all applications), to effect a Sale of the Stock at as early a period as possible, consequently beg to solicit the attention of Gentlemen and the trade to the large and remarkably healthy and well-grown stock, consisting of fine large Laurels, twice transplanted, of extra growth; Portugal Laurels, very handsome; Green Hollies, of various sizes; Evergreen Privets, fine Standard and Dwarf Roses in great variety, fine standard flowering Thorns, Almonds, Æsculus, Robinias, and other Ornamental Trees, and Evergreen and flowering Shrubs, with a large stock of fine standard and dwarf, trained and untrained Peaches, Nectarines, Apples, Pears, Plums, and Cherries, of the most approved kinds, and of growth rarely equalled; also, a large assortment of Forest Trees, consisting of Limes, Elms, Birch, Beech, Hornbeam, Spanish and Horse Chesnuts, Mountain Ash, Poplars, and Spruce, and Scotch Firs; also a large number of Gooseberries and Currants, of excellent growth, and of the best varieties in cultivation, to all of which J. & J. F. respectfully invite the inspection of Gentlemen and Nurserymen, flattering themselves that the general character of the Stock is such as to ensure unqualified satisfaction, and which they are disposed to offer at very moderate prices for cash.

J. & J. F. respectfully beg to call the attention of Gentlemen to their advertisement of Heaths, &c., which has lately appeared in the *Gardeners' Chronicle*. (Oct. 21 and 28.)

Nurseries, Clapham, near London, Jan. 25, 1844.

E. P. FRANCIS, Nurseryman, Hertford, begs leave to recommend to the Nobility, Gentry, and the trade in general, Snow's superb white winter BROCCOLI, in 2*s*. packets, containing half an ounce, which was advertised last season, and will be found to give general satisfaction this winter and the ensuing spring. Also, Snow's Hybrid Prolific Green-flesh MELON, of most excellent rich sweet flavour, warranted to produce two and three crops in a season, from the same plants; has taken six first prizes at the North Herts and South Beds Horticultural Exhibitions, weight from 2 to 3 lbs., sold in packets, 5*s*. each. Also, Snow's Superb Walcheren CAULIFLOWER, which is found to be late and hardy, never runs, and produces beautiful large compact white heads, and is very dwarf. Sold in Packets at 2*s*. each, containing half an ounce.

E. P. F. begs also to recommend a very superior kind of Grange's White BROCCOLI, which produces large compact heads in the months of January, February, and March. Sold in packets, 2*s*, containing half an ounce. The above, making four packets, if ordered together, may be had for 10*s*., at the Hertford Nurseries, or of Messrs. Noble, Seedsmen, 152, Fleet-street; Messrs. J. Wrench & Son, London-Bridge, and Mr. Flanagan, opposite the Mansion House, London.

HYACINTHS AND GROWING STOCK.

HUMPHREYS'S COMPOUND, applicable to all Greenhouse Plants, to Hyacinths and other Bulbs, and to promote the germination of Seeds. Sold in bottles 1*s*. 9*d*. each, by Flanagan & Son, Mansion-house-street; Warner & Warner, 28, Cornhill; Hurst & McMullen, Leadenhall-street; W. Clark, Bishopsgate-Within; Smith, Islington Nursery; Gaimley and Co., Covent Garden; Batt and Rutley, 412, Strand; William and John Noble, Fleet-street; Smith, Covent-garden; Chalkwood, Tavistock-row; W. J. Nutting, 46, Cheapside; G. Lawrence, 18, Piccadilly; John Kernan, Great Russell-street, Covent Garden; Lockhart, 15, Cheapside; Shuttleworth, Pantheon; Minier, Adams, and Nash, 63, Strand; Thatcher and Son, Islington; Thomas Ansell, Camden Town; Thomas Watkinson, Market-place, Manchester; W. E. Rendle, Plymouth; Dickson & Co., Edinburgh; Pontey, Leeds; Fisher, [illegible]mes, and Co., Sheffield; P. Lawson and Son, Edinburgh; [illegible] leading Seedsmen in town and country. Wholesale [illegible], Davy, Mackmurdo, and Co., 100, Upper-Thames-st., London.

A SUCCESSFUL METHOD OF GROWING THE LISIANTHUS RUSSELLIANUS.

JAMES CUTHILL has printed the whole account of his treatment of the above most splendid plant, which has often been exhibited at Chiswick, Regent-street, and the Royal South London Societies; his largest plant this year having 600 blossoms on it, and gained the large silver Medal at the Royal South London Exhibition. A packet of Seed, with the printed directions, will be sent at the small price of 2*s*. 6*d*. Also very healthy plants of the above, from 2*s*. and upwards. Also Cuthill's celebrated Early MELON; his early improved Black Spine CUCUMBER, at 2*s*. 6*d*. each packet, or 6*s*. for the three packets.—Florist, Denmark-hill, Camberwell, London.

Cuthill's Black Spine Cucumber Plants, very strong and healthy, to be had during January, February, and March.

The true Bromsgrove MELON, 2*s*. 6*d*. per packet, as shown at Regent-street. Also Cuthill's Prince of Denmark, Clove-scented Border CARNATION, recommended by Dr. Lindley as the best Border Carnation ever seen, and a Nosegay in itself. 12*s*. per dozen.

SEEDS, NEW AND TRUE.

MESSRS. SUTTON AND SONS respectfully acquaint those readers of the *Gardeners' Chronicle* who have not yet hitherto honoured them with their commands, that their grounds being situated at considerable distance from each other, and of different soils, they are enabled, by their selection, to grow GARDEN SEEDS true to their kinds and equal to such as they know to be new, true, and productive crops. A great saving of expense will also be effected, and the most improved sorts insured by purchasing either of the undernamed collections, which are selected according to Messrs. Sutton's actual knowledge of the comparative merits of each kind.

	£	s	d.
No. 1.—*A complete Collection of new Kitchen-garden Seeds, of very best kinds, being one year's supply for a first-rate establishment*	3	3	0
No. 2.—*A Collection containing all the kinds as the above, but in smaller quantities*	2	2	0
No. 3.—*A complete Collection, in quantities suitable for smaller Families*	1	1	0
No. 4.—100 *Ranunculuses, in 50 fine varieties, by name*	1	5	0
50 *ditto* in 50 *do.* *do.*	0	15	0

N.B.—Parcels delivered free of carriage to London, or to any part of the Great Western Railway within 50 miles of London.

For Gardeners and others who would prefer selecting the sorts of seeds themselves, S. & Sons have just published their annual Catalogue of new Kitchen-garden and Flower Seeds, which will be forwarded immediately, post paid.

*** Where a reference is given payment need not be made for twelve months, which will afford ample opportunity for proving the excellence of the Seeds.—Reading Nursery, Berks, Jan. 25.

DAHLIAS.

J. KEYNES, FLORIST, Salisbury.—"STANDARD OF PERFECTION," (Keynes).—The finest self coloured Dahlia in the world" gained the 1st class prizes at Stonehenge, Windsor, Kingston, Surrey Zoological Gardens, and Crown and Anchor, Stockwell, also the 1st prize seedlings at Stonehenge Floricultural Society, Stockwell. "It is as round as any Dahlia in cultivation, as complete an unbroken circle as could be drawn with the compasses, and as globular in front as possible. It is symmetrical to a hair, and as double as a Ranunculus. It is so remarkable as to be instantly recognised among a thousand. Colour, deep crimson. It is the flower of the season, and must be had."—*Gardeners' Gazette*, Oct. 14. "The best-grown flower we ever saw, without exception, every requisite to meet the taste of a connoisseur being complied with; good colour, a honeycomb, regularity of growth and disposition in the leaves, and above all, as complete a rotundity of shape as if it had been cast in a mould."—*Salisbury Herald*, Sept. 2, 1841. Plants in May, 1844, 10*s.* 6*d.* "Orange Superb," Dodd's first-rate show flower, 10*s.* 6*d.* "The specimen sent would grace any stand."—Glenny. "Emma Noke," Dowding's Shaw white, extra fine, indispensable to a first rate stand, 10*s.* 6*d.* Catalogues containing all the fine old varieties and new flowers for the season may be had on application.—Salisbury, Jan. 10, 1844.

DWARF CHERRIES GRAFTED ON THE PRUNUS MAHALEB, OR PERFUMED CHERRY.

T. RIVERS, JUN., begs to offer the following sorts of CHERRIES, grafted on the above Stock, Root-pruned, and admirably adapted for potting, for forcing, or for forming Dwarf prolific Trees, to be protected by nets, 2*s.* 6*d.* each —

Arch, or Holman's Duke
May Duke
Royal Duke
Late Duke
Biggareau
Black Eagle
Belle de Choisy
Elton
Early Amber Heart (Rivers's)
Florence
Knight's Early Black
Imperial Morello
Black Tartarian
Tradescan 's Black
Waterloo
Werder's Black Heart.

The following Ornamental Standard Trees for Lawns are also offered :—

	each. s.	d.		each. s.	d.
American Weeping Willow, 8ft.	5	6	Robinia macrophylla, or grandiflora, 6ft.	3	6
*Cytisus elongatus (pendulous), 5ft.	2	6	*Yellow Broom, 5ft.	2	6
*Cytisus purpureus do., 5ft	2	6	Double Dwarf Almond, 4ft to 5ft.	2	6
*Cytisus purpureus, flora alba, 5ft.	3	6	Siberian Almond, 4ft. to 5ft.	2	6
*Cytisus nigricans, 5ft.	3	6	White flowering Dwarf Almond, 4ft. to 5ft.	2	6
*Cytisus falcatus, 5ft.	2	6	Dble. flowering Peach, 5ft	1	6
*Genista maxantica, 5ft.	3	6	Weeping Laburnum, 6ft	2	6
*White Portugal Broom, 5ft	3	6	Eagle's claw Maple, 6ft.	1	6
*Double Yellow Broom, 5ft	3	6	Lilac, rubra grandiflora fine plants, 6ft.	2	6
Robinia hispida major largest Rose Acacia, 6ft	3	6	Lilac, Charles X., do., 5ft	2	6

Female Plants the fruit bearing plants, of the Shepherdia argentea, or Buffalo Berry, recently imported from America, 2*s.* 6*d.* each. "Its fruit, which is much relished in America, is about the size of the Red Currant, much richer to the taste, and forms one continued cluster on every branch and twig."—*Loudon.*

Carriage of all Packages paid to London.

Those marked * are grafted on the Laburnum.

Sawbridgeworth, Jan. 25, 1844.

ANEMONES AND RANUNCULUSES.—The entire Stock of an Amateur Florist, who has spared no expense in procuring the finest sorts, but whose garden having been sold for building purposes, is compelled to part with them, and offers them on the following terms:—

RANUNCULUSES.

100 Roots, finest sorts, double, named flowers	21*s.*
50 extra extra ditto	15*s.*
100 fine ditto in mixture	8*s.*
100 ditto, second quality	5*s.*
50 Tyso's best semi-double ditto for seed	4*s.*
Packets of 500 seeds saved last year	1*s.* 6*d.*

Any of the above will be sent post paid on receiving a remittance by Post-office order, or letter-stamps to the amount wanted.

ANEMONES.

100 Splendid, named, double flowers	21*s.*
50 extra fine ditto	12*s.*
100 fine ditto in mixture	7*s.*
50 fine scarlet ditto in mixtures	8*s.*
Packets of seeds, each	1*s.*

Apply to S. G. LEIGH, Wine-merchant, Oundle.

SHOW DAHLIAS.

W. R. WHALES' SEEDLING DAHLIAS for 1844, to be sent out in May, at 10*s.* 6*d.* each.

PRECEPTOR.—A splendid crimson scarlet, of good substance and outline, brilliant contour, and well cupped; an exquisite show variety; warranted to the description given of it; height 3 ft.; splendid habit.

SECOND CRIMSON PERFECTION.—A flower of great substance, being 20 petals deep; well cupped, rising centre, constant; first-rate habit; height, 4 ft. Early orders are necessary to procure this variety, being only true ground roots. Price 10*s.* 6*d.*

MARY.—A fancy border variety, white, margined with rose-pink; an abundant bloomer, and constant; occasionally a show flower; shape and habit of Girling's Prince of Wales; height, 3 ft. Price 5*s.*—Elect, near Huntingford, Berks, Jan. 25, 1844.

EARLY PEAS, &c.—HENRY D. CORMACK, SEEDSMAN, &c., begs to inform the readers of the *Gardeners' Chronicle* that they can be supplied with the following Early and Prolific Varieties, viz.:—Cormack's Prince Albert, British Queen and Early Kent Peas; Taylor's Improved Windsor, and Johnson's Wonderful Bean; Manchester Red and Seymour's White Celery; Walker's Long and Hamilton's Cucumber, &c., with every other variety of Horticultural and Agricultural Seeds, at his Wholesale and Retail Seed Warehouse, 106, Deansgate, Manchester.

DEATH OF MR. LOUDON.

THE SUDDEN DEATH OF MR LOUDON has involved his family in the deepest distress in every sense of the word, for although he laboured most incessantly, nearly day and night, for the space of forty years, and has written more extensive works yet, from the circumstance of his being an invalid for years, and the expensive nature of the works in which his Works, he died considerably indebted to the Printers and Engravers; the greater part of this debt was incurred in producing his most valuable, perhaps, of all Mr. Loudon's Works, namely, the "Arboretum Britannicum" a work which alone would have stamped him as an author.

After much consideration, it was decided that the best means of providing for his family and (as means, for, strange to say, with the independent spirit which characterised the life of Mr. Loudon, would be by promoting the sale of his truly valuable Works. There is a large stock on hand of the following Works, the sale of which would extricate the family from their present embarrassed state, by enabling Mrs. Loudon to discharge the debt, and reserve the copyrights in her own hands to ensure a future support; and it is earnestly hoped that every person who respects the memory of the late Mr. Loudon, will exert himself by soliciting his friends to become subscribers for the Publications enumerated below :—

Published in July, 1838, Price 10*l.*, cloth lettered,

THE ARBORETUM ET FRUTICETUM BRITANNICUM;

In Eight Volumes: Four of Letterpress illustrated by above 2500 Engravings, and Four of octavo and quarto Plates.

Just published, complete in One Volume, Price 2*l.* 10*s.*, and in Ten Parts at 5*s.* each,

AN ENCYCLOPÆDIA OF TREES AND SHRUBS;

Being the ARBORETUM ET FRUTICETUM BRITANNICUM ABRIDGED: for the Use of Nurserymen, Gardeners, and Foresters.

Published October 1, 1839, in One Volume, octavo, with upwards of 250 Engravings, Price 1*l.* 10*s.*, and 3*l.* 6*s.*, coloured,

REPTON'S LANDSCAPE-GARDENING;

Being the whole Works on Landscape Gardening and Landscape-Architecture of the late HUMPHRY REPTON, Esq.; with a Biographical Notice, and Notes by J. C. LOUDON, F.L.S., &c.

Published August 1, 1838, in One Volume, octavo, numerous Engravings, Price 20*s.*,

THE SUBURBAN GARDENER AND VILLA COMPANION;

Comprising the Choice of a Suburban or Villa Residence, or of a Situation on which to form one; the Arrangement and Furnishing of the House; and the Laying out, Planting, and general Management of the Garden and Grounds; the whole adapted for Grounds from One Perch to Fifty Acres and upwards in Extent; and intended for the instruction of those who know little of Gardening and Rural Affairs.

Published November 1, 1842, in One Volume, octavo, with upwards of 380 Engravings, Price 16*s.*

THE SUBURBAN HORTICULTURIST;

Or, an Attempt to teach the Science of Horticulture, and the Management of the Fruit, Kitchen, and Forcing Gardens, to Persons who have had no previous Knowledge or Experience in these Departments.

THE GARDENER'S MAGAZINE;

Any Number or Volume published subsequently to 1834 may be purchased separately. The Second Series, consisting of 8 Volumes, from 1835 to 1840 inclusive, for 6*l.* 8*s.* 6*d.*; for 1841, 1*l.* 1*s.* 6*d.*; for 1842, 1*l.* 2*s.*; or the third Series complete in 9 vols., 5*l.*

By a Post Office order being sent to Mrs. LOUDON, Bayswater, London, any of Mr. LOUDON's works will be forwarded in the monthly parcel of any local Bookseller; or through any Nurseryman or Seedsman in the neighbourhood of London. A list of the subscribers' names will appear weekly in the *Gardeners' Chronicle*.

A Public Meeting for the benevolent purpose of promoting the sale of these works will be held in the rooms of the Horticultural Society, Regent-street, London, by the kind permission of the Council, early in February, (notice of the day and other particulars will be advertized in the *Times*, *Morning Chronicle*, *Athenæum*, and *Gardeners' Chronicle* of next week) when it is hoped all persons taking an interest in Gardening, who are within a reasonable distance, will attend.

On the 1st December, 1843, exactly a fortnight previous to Mr. LOUDON's lamented death, he published the following statement:—

"The *Arboretum Britannicum* was got up between the years 1833 and 1838, and published on Mr. LOUDON's own account, at the expense of upwards of 10,000*l.*; the greater part of this sum was owing at the completion of the work, but it sold so well, that the late depression of the book trade in 1841, that only about 2,600*l.* of the debt remained to be paid off at the end of that year. It is, however, necessary to observe that this large proportion of the debt was not paid off solely by the produce of the *Arboretum*, but in part by the profits of Mr. LOUDON's other literary property, consisting of thirteen different publications, (enumerated below,) all of which stand pledged in the hands of his publishers, Messrs. Longman, for the debt on the *Arboretum*. This debt, at the present time, amounts to about 2,100*l.*; and hence, if 350 additional subscribers could be got, the debt would be at once liquidated, and the works pledged for it set free, and Mr. LOUDON or his family would enjoy the whole produce of his literary property.*

"This Appeal would never have been made, had not Mr. LOUDON, who has been an invalid for several years, been lately seized with an inflammation of the lungs, terminating in chronic bronchites, which, even if the disease should be considerably alleviated, will effectually prevent him from any longer pursuing his profession of landscape-gardener, on the produce of which profession, and on the literary labours of Mrs. LOUDON, he has entirely depended for his income, since his literary property was pledged for the *Arboretum*. Under these circumstances Mr. LOUDON feels himself justified in taking this mode of soliciting additional Subscribers to the *Arboretum*, and in begging his Friends and Patrons throughout the country to assist him in obtaining them.

"The *Arboretum* has been spoken of in the highest terms in all the principal Reviews of Europe, and in the Botanical Periodicals of North America. The *Quarterly Review* says :—

"'This book is one of solid value, worthy of a place in the Library of every landed gentleman, as well as of every student of Botanical, Arboricultural, and Horticultural science . . . Let us warmly congratulate Mr. Loudon on having finished his Herculean task; a task which few men, except himself, would have had the courage to begin, and still fewer the perseverance to complete. The *Arboretum Britannicum* is complete in its kind, and it must become a standard book of reference on all subjects connected with trees.'—Oct. 1838."

The following Ladies, Noblemen, and Gentlemen, who already possess the work, on being applied to, have kindly permitted their names to be published as approving of the *Arboretum*, and of this Address to the Public:—

The Right Honourable LADY ROLLE
Mrs. LAWRENCE, of Studley Royal
The DUKE of NORTHUMBERLAND
The DUKE of DEVONSHIRE
The DUKE of BUCCLEUCH
The DUKE of SUTHERLAND
The MARQUESS of NORTHAMPTON
The EARL of SHREWSBURY
The EARL of ESSEX
The EARL of ABERDEEN
The EARL of HARRINGTON
The EARL FITZWILLIAM
The EARL of RADNOR
The EARL of RIPON
The EARL of LOVELACE
VISCOUNT COMBERMERE
The BISHOP of WINCHESTER
LORD MONTEAGLE
SIR JOHN TREVELYAN
SIR THOS. DYKE ACKLAND
SIR H. E. BUNBURY
SIR CHARLES LEMON
SIR OSWALD MOSLEY
SIR WILLIAM JARDINE
SIR W. J. HOOKER
The REV. J. MITFORD
The REV. M. J. BERKELEY
The REV. W. T. BREE
CAPT. WIDDRINGTON, R.N.
JOSEPH STRUTT, Esq., Derby
GEORGE CRANSTOUN, Esq.
L. W. DILLWYN, Esq., Sketty Hall
J. T. BROOKS, Esq., Flitwick House
GREGORY GREGORY, Esq., Harlaxton Manor
W. R. BAKER, Esq., Bayfordbury
P. J. SELBY, Esq., Twizell House
PROF. HENSLOW
PROF. LINDLEY
PROF. ROYLE
DR. NEILL

* It may be thought from the well-known extensive sale, for the last 20 years, of Mr. LOUDON's Publications that he ought now to be independent: in consequence of too intense application while compiling the *Encyclopædia of Gardening*, Mr. LOUDON fell into ill health in 1821, which obliged him ultimately to have his right arm amputated, his left hand being at the same time so much injured as to leave him with only the partial use of two fingers, and his left knee being anchylosed. In consequence of these bodily infirmities, Mr. LOUDON has been obliged to keep an amanuensis and a draughtsman for the last twenty years, and also, during the greater part of that time, a servant to act as valet. Had it not been for the expenses thus incurred, and for others arising from the same source, Mr. LOUDON might have been now independent, even without his literary property. This explanation is due to those who are ignorant of Mr. LOUDON's personal character.

This Appeal has been most liberally responded to, and in consequence of it copies of Mr. LOUDON's Works have been sold to the different Ladies, Noblemen, Gentlemen, Nurserymen, and Gardeners, whose names are included in the following list:—The names are given in the order in which the copies were ordered.

ARBORETUM BRITANNICUM.—10*l.*

Joseph Strutt, Esq.; 2d subscription; 10 copies
Mrs. Lawrence, Studley Royal; 2d subscription
The Earl of Radnor
Lord Folkestone
The Proprietors of the *Gardeners' Chronicle*
Messrs. Whitley and Osborn; 2d subscription
Earl Fitzwilliam; 2nd subscription
Thomas Martin, Esq.
Earl Manvers
Lord Viscount Hill
Lord Thurlow
Lord Southampton
Wm. Spence, Esq.; 2nd subscription
Robert Chambers, Esq.
Lord Clinton
George Charlwood, Esq.; 2d subscription
The Marquess of Waterford
J. D. Llewelyn, Esq.
Sir W. J. Hooker
The Duke of Devonshire; 2d subscription
Richard Lowndes, Esq.
Rev. W. Kirby, M.A., Rector of Barham, Suffolk
The Hon. Mrs. Neville Reid
The Hull Subscription Library
The Duke of Northumberland; 2nd sub.; coloured copy

ENCYCLOPÆDIA OF TREES AND SHRUBS.—50*s.*

G. Cranstoun, Esq., Corehouse
Lord Lilford
The Earl of Dartmouth
The Duke of Sutherland
Lord Worsley
Sir H. E. Bunbury
Lord Viscount Hill
Richard Rathbone, Esq.
Lord Murray
Henry Cheffins, Esq.
Dr. Brown
Edward Solly, Esq.
Charles Stokes, Esq.

THE SUBURBAN GARDENER.—1*l.*

The Marquess of Northampton
The Duke of Sutherland
Dr. Neill
Lord Viscount Sidmouth

THE SUBURBAN HORTICULTURIST.—16*s.*

Earl Fitzwilliam; two copies
Mr. Griffin; five copies
The Rev. M. J. Berkeley
Dr. Neill
The Earl of Derby
Lord Murray

REPTON'S LANDSCAPE-GARDENING, Plain.—30*s.*

Mr. Griffin
Lord Lilford

REPTON'S LANDSCAPE-GARDENING, Coloured.—65*s.*

George Cranstoun, Esq., Corehouse
Thomas Sopwith, Esq.
Lord Harris
Rl. Botanic Society of London
Lord Southampton
Lord Clinton
J. D. Llewelyn, Esq.

ENCYCLOPÆDIA OF COTTAGE ARCHITECTURE.—3*l.* 3*s.*

Mr. Lobau, Southampton
The Duke of Sutherland, one copy complete, and the Supplement separately
Sir Oswald Mosley
The Earl of Derby
Lord Monteagle

THE ARCHITECTURAL MAGAZINE.—1*l.* 6*s.*

The Rev. J. S. Henslow

WATERTON'S ESSAYS ON NATURAL HISTORY.—3*s.*

The Rev. J. S. Henslow
The Rev. M. J. Berkeley
Thomas Sopwith, Esq.
Sir Oswald Mosley
The Rev. W. T. Bree
Sir H. E. Bunbury
Lord Murray
Henry Cheffins, Esq.

THE GARDENERS' MAGAZINE, 9 Vols.—9*l.* 17*s.*

The Royal Botanic Society of London, the Volumes for 1841

HORTICULTURAL SOCIETY OF LONDON.—Notice is hereby given that the Exhibitions of Flowers an Fruit, in the Society's Garden, in the ensuing season, will tak place on the following Saturdays, viz., May 18, June 15, and Jul In addition to the regulations already announced, it ha been resolved that the Judges be instructed, in making thei awards, to take into consideration, whether the Plants to b have been exhibited previously during the season. Fu information concerning these Exhibitions can be obtained upo at 21, Regent-st.

IMPROVED PLAN OF [H]EATING.

J. WEEKS, Jun., and Co., Gloucester-place, Chelsea, beg to inform their friends in the Gardening Profession, that they will be happy to meet them at their Annual Dinner, on Thursday, Feb 1. Those who will favour them with their company are requested to communicate as soon as possible.

The Gardeners' Chronicle.

SATURDAY, JANUARY 27, 1844.

MEETINGS FOR THE TWO FOLLOWING WEEKS.

Wednesday, Jan. 31	.	Society of Arts	. . 8 P.M.
Friday, Feb. 2	.	Botanical	. . 8 P.M.
Monday, Feb. 5	.	Entomological	. . 8 P.M.
Tuesday, Feb. 6	.	Linnean	. . 8 P.M.

The term Landscape Gardening has been adopted to designate a profession, the principles of which, though volumes have been written about it, are not fully understood. The purpose of the profession is to assist those who have little or no taste themselves, in so arranging plantations, and shrubberies, conducting roads of approach, forming rides and walks, placing buildings, &c., as to satisfy the taste of others who may have any in such things. This definition, homely as it may appear, is in reality the marrow of the matter, and at once declares that those who may adopt the profession must have the taste required, to such a degree as to induce confidence to be placed in them. Then comes the question—who is to judge of the qualifications of a Landscape Gardener? Of course, persons who have, at the least, as much taste as the professor. Hence, were a nobleman or gentleman admitting himself not to have sufficient taste of his own to enable him to dispense with the help of a Landscape Gardener, to require it, it may be asked—to whom should he apply for guidance to a skilful professor? It is common in requiring the character of a servant to apply to the master whom he had last served. It is evident, however, that in the case of a Landscape Gardener, we should not apply for information to the employer, because he has, by the very act of employment, declared himself unfit to give any opinion. If the nobleman or gentleman be requested to judge for himself by looking at what has been accomplished, this is absurd; because he has confessed himself to have no knowledge of such matters—no taste; and consequently to be unable to judge of any such work. Here, then, is a difficulty somewhat startling. In order, not indeed to get rid of it, which is no easy matter, but to explain its origin, it is necessary to dip a very little way into the philosophy of the thing; and as Nature is always willing to teach and expound everything that may puzzle us, if we ask her to do so in a proper manner, our shortest way to arrive at truth in all cases, is to knock at her door and make known our wants.

Admitted into her presence, and humbly requesting to be let into some of her secrets, she bids us look about us, and observe the emotions which appear to be excited by the same object in different individuals. We stand near an ancient and noble Oak. The first person who passes looks up and says—"That must be a very old tree—it is so very big; I should like to know when and by whom it was planted—some centuries ago. I doubt not." The next person passes on without taking any notice of the tree. The third stops—looks upward and all around, moving from spot to spot, his eyes broadly opened—"Magnificent!" is his exclamation. "What a noble trunk!—worthy to support so noble a head! How gracefully the giant-arms part from the stem—each in itself a tree! How finely the masses of rich foliage, catching the lights and deepening the shadows, wave into the outline! That is indeed a specimen for the painter!" The fourth also stops—looks knowingly—measures the trunk by embracing it, and observes—"Three fathoms round, six feet through, some 20 ft. without a break! —and there—what glorious knee-timber among the branches!—a good many loads, eh!—and bark—let me see;"—and thus he goes on his way, calculating the value of the timber and bark. Now which of these was the man of taste in reference to the tree? The answer to this question will be different from different persons. An antiquarian will vote for the first; an indifferent person for the second; an enthusiast for the third; and a timber merchant for the fourth. To account for this the vulgar say, every one has his own taste: very truly. *De gustibus non disputandum*, says the wiseacre who is not fond of discussion,—and he too speaks truly. Thus we find that no one denies the fact, that the same object excites different emotions in different individuals. It is the same with groups of objects, in respect to their relative positions among themselves and surrounding objects. Now, though we might enter at some length into the philosophy of these things, it would not be suitable to such an article as this. Indeed philosophers are not quite agreed about the causes of differences of taste. We, therefore, refer such of our readers who may feel inclined to study the subject, to two of the most recent works, Sir T. D. Lauder's edition of Price, and Sir G. S. Mackenzie's Review of the Association theory, in which he makes a strong appeal to matter of fact.—*Gr.*

In our last Number appeared an advertisement announcing the intention, on the part of some friends of the late Mr. Loudon, of calling a public meeting early in February, to consider "the best means of extricating his widow and daughter from the difficulties in which they are placed by his sudden death." This is, we believe, the proper course to take, for the desultory attempts of individuals can never produce the effect which may be anticipated from the operations of a public meeting.

We hope much from this plan, for there is evidently an anxiety among the gardening public to do something substantially useful on the occasion. We have published a few letters on the subject—many more are lying before us; the Members of the Regent's Park Gardeners' Association have had a meeting, for the report of which we regret that we had no room; and Mr. Paxton has issued a circular appealing strongly to the friends of Horticulture for assistance.

As soon as arrangements for the proposed meeting are completed they will be advertised in our columns.

We do not consider that it will be useless or uninteresting to explain a little in detail some of the prevailing theories and contrivances having regard to the burning of coal and other similar materials in ordinary furnaces; because, although such knowledge may be of little use in the management of any given apparatus, it may, nevertheless, enable many persons to form a better judgment than they would otherwise arrive at of the various new projects which are perpetually brought forward: at the same time, it must be confessed that the minute display of chemical, down even to atomic illustrations, which are occasionally brought to bear on this subject, and the extreme nicety with which the elements of combustion are proposed to be balanced and adjusted, are somewhat out of place, when it is recollected that these refinements are spoken of in reference to an operation which undergoes immense changes, while the mechanical appliances remain unaltered. The furnaces to which these remarks apply have, among other causes of change, to be fed at long intervals, presenting, at one time, a dense mass of black coal, and at another, a heap of glowing cinders—a change of circumstance, which, independent of changes in the character of the coal and in the state of the air, must cause a very great change in the chemical action of the two periods, and must require equally great modifications in the admission and distribution of air, to render available the extreme accuracy which is professedly aimed at in the previous calculations.

This last remark, it is true, would not apply in full force to those furnaces which have revolving, or rolling, or oscillating, or otherwise movable grates, and which are fed at such short intervals and with such infinitesimal doses, that they may be said to receive a constant stream of coal. These costly and complicated contrivances seem, however, too troublesome or too expensive even for steam-engines, where there is power to work them and constant attendance to keep them in order; they may therefore be safely dismissed as hopelessly inapplicable to horticultural purposes—and without much regret, since they afford no proof that even they overcome the difficulty formerly alluded to, arising from the essential non-inflammability of some portion of the earlier products of distillation; nor do they attempt to meet the second great objection to ordinary furnaces, which will be presently explained, and which, if it exist as asserted, is the largest in pecuniary amount, though it may be the smallest in annoyance. There arises, it is admitted, but little visible smoke from some of these ingeniously-constructed furnaces; but that may be accounted for by the extremely small quantity of fuel supplied at one time. The complete absence of visible smoke is, however, no proof of complete combustion, as it is well known that there may exist a considerable escape of fuel in the form of transparent vapour.

Before, therefore, we quit this part of the subject, it may be stated, that, since it is out of the question to expect complete combustion, or to prevent the escape of very disagreeable matters from the burning of mineral coal, it will always be expedient to keep the chimneys as far removed as possible from [illegible] mental garden [illegible] from all ornamental garden or conservatory, and this may be accomplished in at least two ways, employing either or both. The first method is to convey the smoke-flue from the furnace in an underground channel; and the second is to convey the hot water or steam in a heat-tight tube, which may be either above or below the earth. Either of these means may be used under ordinary circumstances to the extent of an hundred feet, making it therefore easy to remove a chimney two hundred feet from the place where its effects are to be produced.

Even this distance would not, in many instances, sufficiently remove the objectionable matters, and they are besides liable to be returned by the wind: it is still desirable, therefore, as a matter of luxury, as well as one of economy, to consume the coal in the best possible manner, and this will lead us to consider the matter somewhat minutely, as it is only by ascending to first principles that a judgment can be formed of the claims to philosophical accuracy and excellence which are advanced by some of the more recent candidates for public approbation.

The regulated admission of air, which is at present the favourite mode of improving a furnace, will first demand notice, and we cannot enter on this subject without reference to that invention, which has, perhaps, obtained the greatest share of notoriety, and which has elicited very favourable opinions from many persons whose names command respect. The invention we allude to is that which is secured by patent to Mr. Charles Wye Williams, and of which certainly all Horticulturists should avail themselves, if it possess but half the merit ascribed to it, and if it can be obtained on terms commensurate with the comparatively small consumption of fuel required for Horticultural purposes.

The description of this invention we must give in a future paper, together with an abstract of the principles on which it is founded.—*A.*

BEES.—No. IV.

(*Continued from page 37.*)

I shall now endeavour to ascertain the most profitable mode of augmenting hives. Within 20 miles of London, and, I apprehend, in many other parts of England, honey is seldom used by common trades'-people but as a medicine. In many parts of Scotland it is otherwise used: there, like butter, it is spread on bread and taken at tea. Hence, run-honey is dearer there than here, though honey-comb is not. In Scotland, where honey-comb (in small and neatly-made hives or boxes) is not sold for double the price of run-honey, eking, that is, raising the hives three or four inches with parts of old hives, is the more profitable system; for the Bees have not only more room to work, but also more comb to breed in, than they have when crown boxes are used. But about London, where honey-comb may be, I apprehend, sold for 2*s.* or 2*s.* 6*d.* a pound, the crown-box mode ought to be adopted. Honey, as well as honey-comb, is obtained when small boxes are used. Mr. W. Pettigrew, at Carluke, informs me that he has "taken three small crown-skeps (small neatly-made straw-hives, in which honey-comb looks better, and is more saleable in the Glasgow market, if I don't forget, than in boxes,) from one of my top or first swarms of this year. The first, which contained 9¾lbs. of comb, was sold for 17*s.*; the second, 9 lbs., for 18*s.*; the third, contains 7 lbs., which I have not sold yet: and from the hive on which these were filled I got 37½lbs. of honey." He did not say how much honey he obtained from the stock, or second swarm; but we here see that he has realised from the produce of one swarm a sum bordering upon, if not above, 4*l.* Where crown-skeps or boxes are used no virgin swarms ought to be taken, even though those swarms (erroneously called *virgin*) may be taken off at or before the beginning of July. In propitious years a second swarm or turn-out will fill a box. Large swarms will fill a box or skep that holds 15 or 20 lbs., without breeding in it; but a box that contains about 10 lbs. of comb is more saleable than a larger one. As soon as a box or skep is put on and pinned to a hive, make the Bees run up into it by blowing smoke into the hive. In order to be able to ascertain when a crown-skep is filled, there ought to be two peep-holes in it. In taking off a crown-skep it is necessary, first, to sever it from the hive with a bit of brass-wire, then raise it with wedges three-eighths of an inch, that the Bees may lick the honey out of the cells that are broken and bruised with the wire. When it has been two or three hours thus raised, it should be removed, and, if the season is not over, another put on. If a lady or gentleman should, about swarming time, send in an order for a box of comb weighing 8 or 10 lbs., put a first swarm into a second swarm-hive, and you will be able to meet the order in a short space of time. But it may be well for those whose hives are at present small to dispense with boxes till their hives are larger.—*A. Pettigrew, Wrotham Park, Middlesex.*

(*To be continued.*)

BOTTOM-HEATING and NIGHT-COVERING.

The matter of night-covering is closely connected with that of Bottom-heating; and it is strange that the great utility of mats on structures such as Pine-pits (possessing a permanent source of Bottom-heat within) has not long since pointed out the much greater necessity for such coverings on structures for very early forcing, that depend for their heat, in many cases, on a considerable surface of parching flues or pipes.

The chief hindrance [illegible] to the adoption of coverings at certain seasons, and for certain purposes, has been the want of a material at once light, pliable, durable, and economical. Regarding the last, I am sure that the saving of fuel would, under good management, pay for the cost of material; and for the former qualities, I have no doubt that, could the attention of our manufacturers be fairly drawn to the subject, we should not be long without something to the purpose.

I do not mean here to assert that Night-coverings are

necessary to all structures, and at all seasons—by no means; I would merely wish to draw attention to what takes place in an early forcing-house (unprovided with Bottom-heat) on a severe night—say in the middle or end of January, and the case in hand, by way of illustration, an early Vinery, depending entirely on flues or piping. If the atmospheric moisture, which must be provided by some means, could be kept suspended without condensation at the roof, there would be little occasion to care, in my opinion, about the loss of 5 or even 10 degrees of heat, and the 65° or 70°, as recommended by mere prescription, might be allowed to sink quietly to 55° without any injury—nay, with, perhaps, a positive benefit.

But how is this to be accomplished without roof-coverings, with an outside thermometer of, say 20°, and an inside one of 65° or 70°? To maintain these punishing temperatures a very strong fire must be kept up, which, from rapidity of circulation, must force some 20 per cent. of heat out at the chimney-pot, and exercise, by means of scorching flues or pipes, a powerfully extractive process (if I may use such a term) on the leaves.

To be sure, we can provide such an abundant supply of atmospheric moisture as may compensate for the loss; but can it be supposed that continual distillation of this kind can afford as genial an atmosphere as one in which the gases from sweet fermenting materials are kept in suspension, and in which all such distillation is obviated by a night covering?

It may be fairly assumed, I conceive, that in consequence of the great disproportion which light bears to heat in these northern climes as compared with tropical ones, that we are by no means justified in attempting to imitate the extreme points to which vegetation is subjected in those climates. The general consequence is an impure atmosphere, which, in conjunction with the want of light before adverted to, produces many and serious evils; amongst which we may mention, first, long-jointed and of course imperfect wood; and, secondly, a dissipation of vital energies, leading ultimately to abortive results.

I have a Peach-house under my care, the night temperature of which has frequently, about the end of February, when the fruit was as large as Peas, been as low as 40°; and, so far from receiving injury, the fruit has been benefited by it, and, grown under those circumstances, has carried a medal six or seven years successively from the Horticultural Society of London.

As to the mode of obtaining bottom-heat, it appears to me that although the tank-system is destined to supersede the old modes of bottom-heat, (and as a general principle deservedly does so,) yet a little consideration is necessary before those enthusiastically inclined towards the new mode discard entirely the old process of fermenting materials. A question arises about the character of the tank covering with regard to the admission of so much moisture as may be necessary, and no more; and a second, more important still, whether the gases produced by fermenting matter can or ought to be entirely dispensed with.

I presume that the gaseous products of fermenting matter are a very different thing from the mere steam of water, which, although gaseous, is not so rich in constituents. Without chemical knowledge, every gardener knows that what is technically called "a sweet bottom-heat," such as a well-wrought Cucumber frame, is just the sort of place for certain quick-growing plants to make the most rapid advance in; therefore it seems to me to be something more than a mere question of heat and moisture.

The sweet bottom-heat of fermenting materials "well-wrought" approximates the conditions of moist tropical climates, about which I beg to quote Mr. Solly's remarks in "Rural Chemistry," (p. 368) which runs thus:—"In hot moist regions of the tropics, plants grow with far more rapidity, and vegetation is more vigorous, than in temperate regions. In tropical countries decay proceeds far more rapidly than it does in our own country; carbonic acid and ammonia, the food of plants, are produced in greater quantity than here, whilst, from the greater power of the sun, plants are able to assimilate more of those substances than they can in colder countries."

Something, therefore, yet remains to be done before we entirely resign the use of fermenting materials; perhaps the time is not distant when, from repeated analysis and extended physiological knowledge, we shall be able to impregnate the atmosphere of hot-houses with the necessary gases by a regular system.

As to plunging or planting out in a bed of fermenting materials, we acquire still further powers in combatting low temperature, leading ultimately, in-doors, to economy in fuel.

In confirmation of this I need only refer to the "Theory of Horticulture," (p. 105,) where, in a note at the bottom of that page, is fully shown how this principle, which is universal in Nature, or nearly so, acts; and which is amply borne out by facts in every-day practice. The frequent depression of atmospheric temperature out of doors, by winds and otherwise, must very frequently leave the bottom-heat much more than is commonly thought in advance of that of the atmosphere.

Great anxiety is manifested on all sides to obtain clear glass for hot-houses, and very properly; however, not so much pains is taken to keep it clean afterwards.

All pits and frames should be washed at least twice in the year, say February and October, as great benefit will arise therefrom.—*Robert Errington, Oulton.*

SEEDS OF GARDENING.—No. IV.

(*Concluded from p.* 35.)

But I must not on any account dismiss the tin box and the label so lightly, without adverting to its usefulness to lady gardeners, and indeed amateurs in general, who do not get their living by gardening, and are frequently not so familiar with some of its intricacies as the more experienced veterans in the art; for in this I mean to bring the science, or, in other words, all that is known of gardening, to bear so closely upon the practice, that gardener amateur, or even apprentice, may sow seeds in the right sort of soil at the proper time of the year, and for the proper purpose, since every packet of seeds will be enveloped in the information necessary to rear them; for I have seen cases enough where better might have been expected of persons sowing such as Loasas and Convolvuluses, of very dissimilar habits, in such a way as showed that they thought all Loasas were tall twiners, and all Convolvuluses more or less similar; whilst it is notorious that in both genera there are species that grow only a foot high, mere tiny herbs, whilst others are giant twiners, requiring two or three fathoms of stick or string to support them. When I saw these sowed side by side, I thought, if there had been black letters on the seed-packets setting forth the character of each, things would have been far otherwise, leaving those who erred quite inexcusable.

Those who grow things properly will find the seed-packet cheap enough, and he who sows seeds not knowing what they are, and expects from them what nature never ordained, has "paid too dear for his whistle," and will find that seeds alone are useless and even too expensive, however cheap, without a system to grow them by. But some will, no doubt, ask how this very desirable information respecting all our most interesting garden-seeds is to be obtained? Gardening books abound with such information; but as no living man appears gifted with such extraordinary intellect as to be able to retain it so clearly and fully as to bring it to bear upon his practice at a moment's notice, and amid the bustle and toils of the day, I propose to save racking the brain unnecessarily; and more effectually to serve the purposes of gardening, to digest into the form of a label, and under the head "directions for use"—in plain English, a treatise on the character and culture of the contents of the packet. Mrs. London's "Book of Annuals" would give in simple, popular, and scientific terms the sort of information I speak of for Annuals; and so of other books for the culinary seeds, &c. But for the most part I have another plan, and that is a sure one, to come at the practical points:—the man that grows seeds, first flowers the plant and then fruits it; he, therefore, may know if he pleases more of it than the gardener, who only flowers it. If, therefore, the seed-grower would set forth in writing on the seed-packets the character and culture of them (a theme which must be familiar to him) instead of giving their good properties and details of their uses *viva voce* to the seed-buyer, the chain of information would be complete; it would come direct from the man who perfected the plant, flowered and fruited it, to the man who was about to commence more or less of the same process; and if seedsmen were only to buy seeds from such as knew what the nature and uses of the seeds were that they were selling, we should soon reform our seed-packets, and equal or surpass the men of Birmingham or Manchester in the beauty of our labels and the details of our manufacture; but this is not all in the systematical arrangement of seeds, for if it be necessary for the butler to have binns and a well-furnished pantry appropriate for his business, and the housekeeper to have ranges of shelves and drawers, and other stowage for her paraphernalia, each according to its kind, surely there is something more appropriate for valuable seeds than to be tossed in loose papers in the bottom of an old hamper, which I am sorry to see is too generally their locality. I would therefore arrange them in trays, each tray to be a drawer, and fit into slides forming a nest or chest, the top being a table or counter, the laboratory of the seed department. One tray would hold 200 separate packets of the size of the percussion-cap box, which holds 2 oz.; and this tray would only be 40 inches long and 20 wide: and, mark well, every packet would be open to view, and might be as easily opened and some seeds come at for sowing and the remainder secured as the grocer comes at his Congou Tea for the ready money customer and secures the remainder in his well-ordered canister.

Now, let any one put 200 papers of seeds, untied, in a drawer 40 inches by 20, and let him look them over once or twice to sow small moieties and replace the remainder, and see the result—the working of the medley; and if he has the bump of order in his head at all, he will thank any one to lend him a hand to set his seeds in order. Begging pardon for this lengthy document, which I could not abridge and render the meaning clear, I hope seeds may be respected, saved, preserved, and carefully distributed, and then our waste lands would wear a warm and wealthy aspect when the myriads of seeds of all kinds that are annually wasted should be gathered into barns and put forth to usury in the spring in the bank of Earth.—*A. Forsyth, Alton Towers.*

THE ROSE-GARDEN.—No. II.

(*Continued from page* 36.)

Securing a Supply of Buds.—It is necessary, at the commencement of the following observations, to remind the reader that *ex quovis ligno non fit Mercurius: Anglice,*—Good work will not spring from bad materials. Previous, then, to making any other preparations, it is desirable to secure a supply of buds against the time when they will be used, either by having the plants from which they are to be taken, in the garden of the operator, by promise from that of a friend, or by purchase from a nurseryman who can be relied upon. (It may be as well to remark here, that if either of the latter be the case, it will be well at the time of use to see that the shoots on which the buds are be quite fresh, or, if possible, to cut them on the spot.) If, however, the necessary supply cannot be obtained by any of these means, nothing remains but to buy a few plants for the purpose. In this case, fine ones should be secured, as small weak growers will produce few shoots fit for the purpose. If the plants to give the buds be on their own natural roots, it is necessary to see that they are planted as soon as they have lost their leaves in autumn, in order that they may get well settled before the spring; but if it be desired to secure a good supply, a strong-stemmed standard Rose or two should be purchased at a nursery, and such only chosen as have plenty of young wood, and are in health. By choosing them without reference to shape, and merely on account of the buds they are expected to yield in autumn, those may be obtained which have been rejected for a season or two by other buyers, and are vigorous and well-rooted. They should be planted with good mould round the roots in November, and care taken to remove any leaves there may be on the trees previous to planting. If well staked and trimmed, as subsequently directed, a more regular and certain supply of buds will be procured than in any other way; and, provided the trees be a little favoured, they may get over the injuries inflicted by removing their best shoots, especially if two or three buds be left at the base of each shoot thus removed.

Choice of Stocks.—The proper time to procure stocks is during the month of November; (the period, however, may be delayed until the 1st of February, but it is not desirable to do so, for plants procured and planted in Nov will be found to produce much finer shoots than those planted later; the shoots upon them are also better placed, two rarely starting from the same eye, but springing from following knots, and are opposed to each other on the stock; and if three shoots push, they are in general from the three upper rings on the stock, and even triangular. November plants seem to accumulate their strength, and, as above mentioned, forming their buds at the nearest possible points to the extremity of the stock, start and continue their growth with unabating vigour, and at the end of May an unexperienced eye would at once discern the difference between a body of stocks entered in November and the same quantity placed in the ground in January or February, although an unequal strength in single plants might render the difference not so perceptible.

Four objects are gained by early planting: viz., large shoots—well-placed shoots, with reference to each other both in proximity and position—the formation of a head as near the extremity of the stock as possible—and, on the whole, a more vigorous plant. Late plants, on the contrary, are uncertain as to the places where they will push; a part of the stock is frequently lost from this circumstance. A greater degree of trouble is incurred in removing useless shoots straggling about the stock: and the shoots which are eventually retained are faulty in one or more of these particulars, viz., of a more uneven growth, much smaller than is desirable in circumference, fewer in number, or backward in their growth.

Stocks, however, procured even so late as the 5th or 6th of April, will occasionally succeed, and nothing more is necessary than to send to the nearest wood-cutter, or the headsman of a farm, and desire them to make a collection either from the woods, or to save a supply when they grub up a hedge: in the former, many single plants will be procured; in the latter, most of those which spring from a clump-root. This latter is a matter of small importance, as the wild stock will flourish with hardly any root, and indeed often strike without a single fibre, although plants with fibrous roots are much to be preferred.

In all probability, following the directions received, the sorts of stocks would be brought as well as height, although they differ both in size and sorts in different places; the red have the hardest and firmest wood, and have least pith; the smooth green are the easiest to bud on the stem, and the green and brown striped are between the two. Some sorts, as the red, do not take freely; but as budding should be done at a time when success is almost certain, this is a matter of less consequence than the appearance of the future tree; the clean, healthy sizable stock, therefore, should be chosen without reference to the colour. If, however, there be large choice, the green, green and brown striped, and grey, are questionless the best, the red having a tendency to go off, especially when transplanted.

It is true that the size of the stem will continue to increase after grafting, but not in the same ratio as it would have done with a wild head; the free growers will, of course, increase it much more rapidly than delicate sorts, and if the roots are freed from rotten wood in planting and transplanting, and the shoots above well pruned, there is no fixing the size the stock will attain to.

(*To be continued.*)

ON THE CULTIVATION OF PERSIAN MELONS.

I SEND you a description of the house in which the Persian Melons lately exhibited to the Horticultural Society were grown (see p. 543 and 662). There is nothing novel or remarkable about it, and I should not have thought it sufficiently interesting for the pages of the *Chronicle*, but that I see a great diversity of opinion prevailing as to the best method of affording bottom heat. One gardener advocates steaming the roots of plants over open troughs of hot water; another prefers a dry heat obtained by lighting a fire beneath the bed; a third says that the open tank-system will not do for Melons, because the steam reduces the soil to the condition of mud; while a fourth asserts that the soil is then in the very best condition for the growth of these plants.

Amidst so many conflicting theories, all supported by experienced men, who I have no doubt could each in their own way obtain success, I think that descriptions

structures already in use, and of the measure of success attained by them, may be serviceable in assisting the inexperienced in the somewhat difficult task of deciding; and perhaps I may be able to show, that even those who have no means of obtaining bottom-heat need not despair of growing very good Persian Melons without it, provided they do not aim at having them too early.

The house, of which the accompanying cut is a section, was built in the spring of 1842, principally for a Melon-house; but it is found useful in the winter for forcing Pelargoniums, and in the early spring for Strawberries; to both which purposes it is well adapted, on account of its lightness, the trellis being at such times replaced by a portable stage. It is 28 feet long, and 15 feet wide, and is heated by means of a saddle-boiler, with four-inch pipes passing round the outside of the pit. These pipes are fitted with cast-iron troughs, for holding water, to regulate the moisture of the atmosphere. Beneath the pit is an arched chamber, *a*, along the front of which runs the flue, *b*, imparting a very slight degree of heat to the soil above, and also serving to heat a series of arches, *c*, which run along beneath the path, and are entered from a house in front, *d*, and which are used for forcing Rhubarb, &c. in the winter. I may also mention that the house in front is heated by the same boiler.

In the beginning of June, the house was cleared of Strawberries; it then underwent a thorough cleaning. The pit was next filled, by placing first about six inches of decayed dung and leaves, and upon this a compost consisting of one-half surface-soil of a pasture which had lain for twelve months, and one-half a mixture of turf, dung and brick-rubbish, that had been thrown together for a Vine-border. The depth of the soil was about two feet. The trellis being then fixed, the arrangements were complete. On the 15th of June the plants were turned out, one in each light, and planted about six inches from the front of the pit. They grew most luxuriantly; only two shoots were allowed to go up the trellis beneath each light, and about three Melons were left to swell in the same space. By thus limiting the number of shoots, the leaves had plenty of room to expand, and I think I never saw finer foliage. The number of fruit was twenty-one, and the average weight about eight and a half pounds. The temperature of the house was kept to seventy-two degrees by fire-heat, and the heat of the bed never exceeded seventy-five degrees. As the moisture of the soil and atmosphere is of the greatest importance in bringing to perfection the Persian Melon, I may add, that I never allowed any syringing, or watering with a rose-pot; but twice while they were growing the bed received a thorough watering. The depth of the soil, and its being of a nature to retain moisture, precluded the necessity of often watering. The troughs were kept full of water till the fruit began to ripen, when the atmosphere of the house was kept as dry as possible.

Although the soil in this house received a slight degree of heat from the flue beneath, we have Melons growing in two other places, and doing equally well, without bottom-heat at all; and everything has been obtained from a good soil of sufficient depth that could be desired or expected, from either open tanks or closed ones. One of these places is a low pit, where the soil is placed upon the drainage, with the exception of a thin layer (about 6 inches) of decayed leaves. The other place alluded to is a Fig-house, in which the plants grow in pits about 6 feet long and 2 feet wide. The Melon, for which a Banksian Medal was awarded me in August, [a very fine one indeed—*Ed.*] was grown entirely without bottom-heat. I do not mean to infer from this that bottom-heat is useless; on the contrary, for early crops of Melons I consider it indispensable.

The above is an account of the method pursued in this particular case—with what success those who saw the crop growing in July and August can judge. I shall now make a few general remarks on the soil, on watering, and stopping the plants.

It is of importance that the soil be as rough or lumpy as possible for the Melon, as I find that the roots delight to run among and cling to these lumps, as may readily be perceived by taking one of them up, when the roots will be seen spreading in every direction, and protruding through the surface. The compost I prefer, is one-year-old turf from an old pasture, a small portion of rotten dung, and some lumpy marl, with a little charcoal sprinkled among the marl previous to its being added to the compost. It should be 2 feet deep for the plants to root in, and if moderately dry at first, the fibres will be more numerous and healthy. Supposing things in a state of readiness to turn out the plants, they should be planted at the front of the pit, the leading shoot pinched out so as to leave two eyes, and a slight watering given to the plants to settle the soil round them. If the plants will do without water till the fruit is set, so much the better; as by this time the whole mass of compost will be occupied with fibres ready to supply much nourishment to the plants, and it may be imagined what rapid progress the fruit will make after the first thorough watering the compost receives; the water must be of the same temperature as the compost. At this time great attention should be paid to keeping the atmosphere of the house dry; or if the weather be dull, the proper organisation of the leaves will be prevented by the too great quantity of vapour from the newly-watered soil; to prevent this I place dry mats on the surface, and give a little extra air, keeping up the temperature by the hot-water pipes. During sunshine, the mats are removed to allow the surface to become dry again. By the time the fruit is half swelled, water may again be required,—it must be given as before, paying the same attention to the state of the atmosphere. This will probably suffice till the fruit is ripe; but if water should be again required, it should be given at the sides of the bed of soil, where the extremities of the roots will be, and so as to wet the surface as little as possible, as the atmosphere cannot now be kept too dry for the flavour of the fruit. I may here observe, that the best way to give water is to pour it from the spout of a pot without a rose, and as much between the lumps of soil as possible. In very hot weather the red spider will be troublesome, and I find it necessary to puff sulphur and snuff on the under-side of every leaf, which is easily done in our Melon-house, as the trellis is so much above the soil that a boy may get to nearly every leaf without touching them: this plan is much better than steaming and sprinkling for the Persian Melon.

I now come to the management of the shoots and leaves, which is a point of great importance, as, unless the leaves are allowed plenty of room, by retaining but few shoots, and are kept green and healthy till the last, the fruit will not be good in flavour. My rule is to allow no more than two shoots to be taken up under each light, and no laterals allowed to grow except those on which the fruit are. When the shoots reach the top of the trellis they are stopped, in order to throw strength into the laterals, on which the young fruit will now be forming. When three of the most promising fruit are set, the rest should be cut away with the laterals, and the plants should be examined daily for some time, to see that not a leaf overlays another, and to pinch all laterals that appear.

The Hoosainee Melon may be known to be about ripe when a sweet juice exudes from the stalk near the fruit, which will generally happen in about thirteen or fourteen weeks from the time of planting out.—*G. Fleming, Trentham Gardens.*

Home Correspondence.

Bees and Dutch Clover in New Zealand.—As "R." has applied directly to me respecting the cause which has produced the accession of Dutch Clover recently observed in New Zealand, I will reply to him in the best manner I can. I am inclined to think that the increased produce of Clover has been rather coincident than correlative to the introduction of honey-bees into the Colony, and that it has arisen from some change in the culture of the soil; as such changes are well known to be capable of producing such an effect. If a pasture-field be dressed with soap-maker's waste, or with a compost well imbued with lime, or with lime only, there will be a crop of Dutch Clover, though it had never appeared, or but scantily appeared before. Some attribute this to the land's being placed in a favourable state for the germination of Clover-seed, which had lain dormant in the earth, only awaiting the favourable circumstances referred to, to bring it forth. Others regard it as a parallel case to that afforded by the celebrated Mr. Crosse, who by means of electricity has brought into existence insects previously unknown, and as therefore militating against the doctrine of *omnia ab ovo*. It is a knotty point which I shall not presume to decide, but I hope the remarks I have made may call forth others from some of your intelligent correspondents.—*Edward Bevan, Esgair Evan, Newtown, Montgomeryshire.*

Culture of the Carrot.—Some gardeners imagine that old garden soils are not favourable to the growth of Carrots; but I have produced them in two old gardens, which for years had refused to produce them by the common modes of cultivation. The system I pursue is this: in autumn the ground is trenched to the depth of eighteen inches, in the bottom of each trench a little quick lime is sprinkled and forked up with the bottom; the surface remains quite rough until spring; previous to sowing, a little river-sand or sandy earth is spread over the surface, and dug in as deep as a common spade will do it. I then add a little more quick lime, and rake the surface level; the beds are then formed; drills are drawn in the usual way; the seeds, being mixed with river-sand, are then sown, and covered in with the back of a rake. The width of the drills varies according to the sorts; for small-growing kinds, such as the Early Horn, eight inches is about the width; for the Altringham, ten inches; and for the largest sorts one foot is not too much; and they are thinned out to about the same distances in the drills. Thinning is of the greatest importance: the allowing them to remain too thick is not unfrequently the cause of disease. By the above system, I produced last year on one hundred and twenty square yards nine cwt. of picked roots (varying in length from one foot to eighteen inches), one cwt. of small, and three cwt. of tops, all perfectly free from speck, the sort being the Altringham.—*P. Elliot.*

Cucumbers.—A correspondent, "P. Cope," informs us that at an obscure place in South Salop there was a Cucumber cut on the 3d of December, measuring 13 ins. in length, and $1\frac{3}{8}$ in. in diameter. He inquires if any of our correspondents have outdone this.

Oaks.—Seeing that you recommend Quercus sessiliflora, I shall be obliged by your stating under what circumstances, since it is considered very inferior timber. There is not, I believe, a neighbouring woodman here who is not aware of the extreme softness of the Durmast Oak when felled, or of its very fragile character when applied to any of those uses for which the tenacious properties of the Q. pedunculata are esteemed. The knowledge of this by the Commissioners of Woods and Forests induced their sending particular instructions to the late Mr. Turner (their then surveyor of the New Forest plantations), to cultivate only the Quercus pedunculata. These instructions were accompanied by drawings, which are, I believe, kept in the office of the present surveyor, Col. Thornhill, at New Park. My motive for addressing you is the endeavour to prevent any error that may be likely to accrue upon a subject of such importance as the cultivation of the proper sort of Oak for timber. I have for some years directed my own attention to this subject, and I should be very glad to possess any information that you may be able to afford. It is not many days since that the proprietor of an estate in the Forest directed my attention to a large tree of Q. sessiliflora upon his property at Minstead, saying, "There is a Q. sessiliflora, it is very brittle timber." This gentleman is a large possessor in the Forest, and is, perhaps, more conversant than many other persons with this subject. Contiguous to this property, and upon the open Forest, stands a large tree of Ostrya virginica (supposed to have been planted there by Lord Delaware); it has by many persons been considered an Elm, and branches of it in flower have often been shown as such. There are likewise two fine trees of Quercus alba near the same place, but they do not produce Acorns.—*Rufus, Lyndhurst.* [After having occupied so much space formerly with discussions concerning the popular prejudices against *Q. sessiliflora*, we must refer our correspondent to our Volumes for 1841 and 1842, especially the former. This is certain, that the wood of Q. sessiliflora is in no respect inferior to that of Q. pedunculata. Both are affected by soil, and are occasionally of bad quality. The name Durmast Oak is, apparently, applied in the New Forest to different plants, and therefore furnishes no evidence against Q. sessiliflora.]

Piping Carnations.—This has been successfully practised by removing the mould from a Tulip-bed, placing the leaves of the Tulips underneath, and passing the mould through a coarse riddle. The pipings stuck in this mould are covered with a hand-light, exposed fully to the sun; but in hot weather, in the evening, water is poured over the hand-light. It requires an active person to pick out worms and slugs. If the pipings are placed in a box, covered first with a bell-glass, which is to be exchanged for a small hand-glass, or a larger bell, as the pipings begin to grow, the boxes placed on a stage on a N. side of a tree, and the stage resting on feeders filled with lime-water, there is less trouble with insects, and the pipings will grow very well, but not so rapidly nor so strong as in the former method.—*O.*

Mildew.—I wish to add a few facts to those already stated with regard to mildew, and I hope to suggest a remedy. Having in my conservatory, which may vary in temperature from 38 deg. to 70 deg., an Aimée Vibert Rose, a Hymenée, Thé do., and a Microphylla do., extremely subject to the mildew, I began about a year ago to try a remedy which I think I must have met with in the *Gardeners' Chronicle*, viz., to water them with nitre dissolved in water. The effect is, Aimée Vibert is quite cured, and Hymenée, whose wood was almost destroyed by the disease, is totally free, and making beautiful young wood, the Microphylla, though much improved in health, has still a little of it left. I used 1 oz. nitre to 1 gallon of water (the best I could get at a chemist's), and about once in 10 days during the summer, and am just beginning again to do so. I should think if the Peach-trees were well syringed with the solution, taking care there should be enough to water the roots, it would be effectual there also. I tried sulphur without the least effect.—*Omega.*

On Summer-Pruning Fruit-trees.—In summer-pruning, "Tyro" says at p. 5, "We deprive the tree of its digestive organs without at all diminishing the absorption at the roots; the juices consequently not meeting with a proper surface of exposure, which if no summer-pruning had been performed they would have done, are returned to the tree in a crude and unprepared state, the wood thereby is not of a natural texture, and the fruit is deprived of its proper flavour." Many, however, do not so much deserve blame for pruning as for not pruning. The wall-trees in many places grow as they may, and rows of fruit-trees in the quarters of the garden are never pruned during the summer; all are generally left for the winter-pruning. The luxuriant growth of wood in summer robs the fruit of nourishment, and increases the extension of roots to supply the increased extent of branches on the following season. During winter, the knife removes a great portion of the branches, and the equilibrium that Nature has established between them and the roots is partly destroyed, and a luxuriance of fruitless branches continues to be produced on account of the increased powers of the roots. "In summer pruning," it is said, "we deprive the tree of its digestive organs without at all diminishing the absorption at the roots." I imagine that summer-pruning does diminish the absorption at the roots, and that it establishes a uniformity of circulation between roots and branches. There is such a mutual action existing between these, that whatever is done to curtail the one will affect the other; a judicious summer-pruning of crowded and luxuriant young shoots will allow a free circulation of air, and the genial influence of the sun will better mature the wood that remains, it will also moderate the action of the roots, and the reciprocity between them and branches will thereby be better established without the necessity of pruning much in winter. The use of a strong pair of scissors is all that is necessary for pruning fruit-trees in summer, when the wood is soft. By this practice, the juices supplied from the roots and the gases received from the atmosphere will be concentrated in the branches, and better fruit be obtained.—*W. P. Bamboo.*—Another

correspondent writes as follows: If pruning commenced with the growing-season, and was judiciously carried on, the result would be very different from what arises from the bad practice of allowing a tree at midsummer to present the appearance of an unclipped hedge. The tree might well make a rapid and simultaneous outbreak from all parts; and even, as "Tyro" suggests, if the superfluous wood was left on the tree until the winter pruning, the rapid outbreak in spring, although not to such an extent as it had been in summer, will yet be much greater than is consistent with the permanent well-being or fruitfulness of the tree; for as sure as those strong growths are cut away after having become strong, so sure will the tree make vigorous efforts to replace them, unless the supply from the roots is interrupted. Hence the great good of root-pruning, or, what is perhaps better with young trees during the first three or four years after planting out, when they are so very apt to make strong wood, to lift them and replant them. If pruning begins as soon as shoots appear where they are not wanted, a great deal of wall may be gone over in a short time. The trees by this method will present a neat and healthy appearance; and the young wood, by being freely exposed to the action of sun and air, will be well ripened. Respecting leaves, when they are produced in great quantity they are generally small, and small leaves are by no means so efficient as larger ones are. Take the Vine for example: if the foliage is good, and has been properly exposed to the influence of light, &c., the wood will be strong, the eyes plump, and, under favourable circumstances, a good crop will be produced. Now the reason of all this is very obvious—it is breadth and health of foliage, and not numerical quantity that is requisite to elaborate the juices of a plant; two or three large and healthy leaves are better than a dozen small ones. Physiologists are in error when they forbid us to prune a forest-tree because a few of its leaves would be lost. This remark is equally applicable to fruit-trees; but still I am no advocate for putting the axe and saw mode into general use. Pruning, to be efficacious, whether on fruit or forest-trees, should be performed as soon as the part to be rejected is capable of removal.—*A. Dawson.*

Summer-pruning Fruit-trees.—One or two correspondents in a late *Chronicle* have started the question—how far is summer-pruning desirable? and they appear to say not at all. This is a subject deserving far more attention than it has hitherto received from gardeners generally; and so far as I can judge from my own observations, the summer-pruning of fruit-trees is productive of nothing but leaves to the trees and disappointment to their owners. I have pruned at all times, and, as far as I could understand them, exactly in the way directed by my authorities (books on Horticulture), but I can safely say that I never yet saw a blossom-bud upon the spur left for its production, if the tree was at the same time growing vigorously. It is true that by root-pruning or ringing the bark, I have made these spurs form blossom-buds, but these practices are not always desirable. I fancy, however, that I learnt a good deal on the subject from an itinerant Scotch gardener whom I employed to train and prune my trees some winters ago: his maxims were, "never cut away a twig in the summer that you can, by any possibility, get to the wall; for," says he, "did ye ever see a clipped thorn hedge full o' May-blossom? ye pit the trees quite oot o' temper when ye keep cut, cut, at them a' thro' the summer, an' it's just a battle between ye, whether ye tire o' cutting or they tire o' growing first: his other maxims were—prune freely in the winter; keep your tree well balanced; nail in, at full length, all young shoots intended for bearing; keep up a succession of young shoots to supply the places of those that are worn out and exhausted by bearing, and ring your trees when the growth of them is too luxuriant. I must admit that his fondness for ringing was carried to what I considered a great excess, for he would ring Plums, Cherries, and Peaches, (despite of the gum), with as little forbearance as he would an old Crab-tree; however, he made the trees produce such crops as had not previously been seen in the neighbourhood. I trust some of your scientific contributors will offer a few remarks on this subject.—*T. G.*

Pruning Forest Trees.—This is a subject in which I am much interested, having inherited an extensive range of plantation and planted many acres myself. Dr. Thackeray states that he commenced on the removal of the trees from the nursery, by cutting two, three, or four branches from his trees, and from some, annually close to the stem, beginning at the top of the plant and descending, balancing the tree as well as he could. He further adds that his woodman and his assistants have persevered in this system at all seasons of the year removing all large luxuriant branches from the same tree once or oftener; the result has been that his trees have acquired strength and vigour, as is evident from the healthy appearance of them, as well as their augmented size. If this is the mode in which Dr. T. proceeds, I differ from him very widely. Should I be able to form an Arboricultural Society, Dr. T.'s plantations shall be visited. I hope to do this myself next summer; for my present purpose I will bring to my aid the positive knowledge we possess on this subject; and what could I do more as member of any society than to propose that theoretical disputed points should be proved? Mr. Billington, who had the management of one of the Royal forests in the north of England, now residing near Oswestry, has given in a publication some valuable facts, the result of his experiments with Larches: one with the branches entire had increased 2½ ins. in girth in each year for four years on an average; a second, with branches shortened, 2⅛ ins., and another, with branches cut close to the stem, *only* 1⅜ *ins.* Again, in another, his 2d division, a tree with branches cut close in four years, had increased 3 ins.; the tree with the branches entire had increased 7 ins. in four years, making *one inch in each year more than the other*, an object well worth attending to. These facts are superior to theory. What, then, is the value of Dr. T.'s universal pruning at all times of the year? Great improvements have taken place in Agriculture in sowing Wheat in drills a good distance apart, saving one-half of the seed, and producing a larger crop. I hope, therefore, that gentlemen will know the great advantage of only allowing a certain number of trees to grow on the ground; as many only as it will support and bring to maturity. An incalculable loss takes place in England by the mismanagement of woodland property. Cut wood and have wood is my motto, after 30 years' experience. I cut away trees where there are too many. I wish to shape my practice in accordance with the laws of nature, and not to set myself in opposition. I expect to find her a kind handmaid if I woo her skilfully, but a very termagant if I resist her. "Quercus" has been attacked, because he has advocated nature, and is advised by one gentleman from the county of Kerry to take a journey to Chester, to ascertain by his own inspection the state of the Nerquis plantations. If Dr. T. would have the goodness to say what is the height of his trees, and at what distance they stand from each other, "Quercus" would then be able to form a better judgment. It often happens that by pruning severely the owner thinks he can keep so many more trees on the ground. Thus, one giant evil produces another, and both end in complete ruin.—*James Hamerton, Hellifield Peel.*

Hammond's Cape Broccoli.—I suspect "W. N." must have received some other kind of Broccoli than Hammond's Cape. With us, at Broadlands, no signs of tenderness are visible, even during sharp frosts; the heads are large, and as close and white as a Cauliflower. It continued in use until a fortnight ago, and if enough had been planted it might have been prolonged until February. — *Samuel Henman.*

The Fig.—Many papers have appeared from time to time upon the culture, pruning, and management of this plant, but we are still as much in the dark respecting it as we were 30 years ago. It still remains independent of man's control—producing abundantly, or continuing barren, year after year, as though it were the sport of chance, or were governed by influences wholly unknown to science. It seems that there is but one object to be accomplished towards bringing this wayward producer under subjection: it is admitted by all that the only crop of fruit which can be expected to ripen in the open air in England is that which is produced upon the Midsummer shoot of the previous season, upon which the fruit-buds are formed which, if not sufficiently advanced to form the second crop—to fall unripened with the first frost—become the fruit of the following spring. If, therefore, some means could be devised by which, as soon as the Midsummer buds are formed, the further growth of the tree could be checked, it seems reasonable to suppose that we should be able to insure a crop in the next season. Possibly, you may be aware of some experiments having been made with this object. Would taking the tree up, or pruning the roots in autumn, have this effect—or could you suggest any other means by which this object might be attained? —*J. J.* [We are happy to say that one of our correspondents, a first-rate practical man, is preparing a paper on this subject.]

To Destroy the Wireworm.—When I get in my turfy loam, I have a copper of boiling water ready, and as the turf is stacked up, upon every layer of it I pour from the rose of a large watering-pot (holding it down quite close) a good drenching of boiling water; I then add another layer of turf, and so on throughout the whole. It effectually destroys insects of every kind, and materially assists the decomposition of the turf. If the loam remains for a length of time before it is used, when about to pot Carnations, or any flower suffering in an equal degree from the attacks of wireworm, I spread upon some hard ground the compost I have prepared for the purpose, and giving it a good sprinkling of boiling water, I allow it to remain until it is dry.—*Rusticus.*

The Himalayan Funnel.—It has frequently been your business, no less than your pleasure, to discuss the various forms and materials of garden-pots and watering-pots, which, as appurtenances, however humble, to Horticultural pursuits, you seem to have thought invested with as much dignity, derived from usefulness, as entitled them to your attention. On the same principle you will perhaps be disposed to notice a prospectus which I send you, announcing a new chimney-pot, which, as flues and fires are essentially Horticultural, has a fair claim on your consideration. This particular chimney-pot has, however, a double interest; it is no vulgar invention of some subannuated sweep, driven by the relentless humanity of Parliament to seek, as *Punch* has it, consolation in distant *climes*; but it has been imported from the Himalayan Mountains, 28,000 (?) feet above the level of the sea, by an enterprising British officer, who, whatever he may think of fire, is clearly not afraid of smoke. I would be serious on this subject for its own sake as well as its associations. Who, indeed, can contemplate a Himalayan chimney-pot without thinking of a Suttee, or muse upon the circumstances which have carried the mechanic arts to such a height in those benighted regions, without imagining some mysterious connexion between the Brahma of their idolatry and the Bramah of ours? A new Himalayan plant with some unpronounceable name would have been an object of interest; but a Himalayan chimney-pot, the produce of Himalayan intellect, is as superior to the former as mind is superior to matter. No matter, however, how this may be, the chimney-pot in question is based upon the most recondite principles of science—mechanic, pneumatic, hydraulic, *et omne quod exit in ic*—including, last and, by no means, least, that it is secured to a lucky acquaintance of the British officer aforesaid by the act of the 65th, 6 and 7 Vic. The happy possessor of this immaculate chimney-pot may bid defiance to the winds; for while, as the proprietor states, with infinite candour, "most other inventions are singularly adapted to increase the evils they profess to remedy," this can never fail. Let the storm blow up or down, or right a-head or round a corner, north or south, or east or west, this universal apparatus turns the blast to its own account, and compels it to aid in the escape of the smoke. Tempests cannot shake it, nor floods overwhelm, nor fire consume it; and it is made of such enduring materials, and in such diversity of shapes, that age cannot wither it, nor *custom* stale its infinite variety. I could say more on this topic, were I not fearful of subjecting you to a claim for the advertisement duty, which it is your duty not to evade; but I have thought it my duty, nevertheless, to prepare your readers for the forthcoming announcement of the Himalayan Chimney-Pot.—*Fumus.*

Budding and Inarching the Vine.—Wishing to increase the number of Muscats of Alexandria and Cannon Hall Grapes, I cut down a few Vines; one-half of them was budded, and the other was inarched. To test the merit of each method fairly, both budding and inarching were done at one period. The result is, that by the former method, bearing wood has been produced nearly double the strength of that by the latter. In budding, the following is the method I pursued:—The old Vines were cut down in the autumn of 1842. They were laid in March, 1843; as soon as they had made shoots a few inches long, two were selected on each Vine, and all the others were taken off. These were tied in, and laterals were pinched regularly off them until May. The young shoots were then about two-thirds up the rafters, and nearly full-grown in thickness at the base, but not ripened or turned brown. At that period the buds taken from young shoots with leaves not larger than two inches in diameter, were put on; the wood was left in the buds; they were inserted in the usual way, and tied firmly with a piece of matting. In the course of ten days or a fortnight they were united, the matting was undone, and the shoots were cut down to the buds; all shoots below the buds were taken off as they made their appearance. After this was done they grew away very strong and rapidly. Some of the buds showed fruit, but this was pinched off. The leaves attached to the buds never flagged.—*W. G.*

The Hechfield Pit.—Some inquiry having been made as to the manner in which this pit (of which an account is given at p. 892 for 1843) is managed, Mr. Berry has been so obliging as to forward us the following statement:—Respecting the mode of getting over the difficulty of the plants subsiding too far from the glass, we endeavour to prevent this evil by filling the pit pretty full, with the stuff put compactly together. The ridge of mould is laid along the back, and the plants are planted along the ridge, within 18 inches of the back wall; they are trained towards the front, sometimes on a trellis, and sometimes without. The plants being placed near the back, the roots are more secure against injury from over heat, whilst ample space of surface is left in front for stirring up, &c.; and, if it is requisite, a few inches of dung are added to the surface before the bed is finally earthed over. The trellis, or rather a small trellis under each light, is formed with two pieces of wood laid across the bed, having notches cut out on the upper edges for the reception of pieces of lath, which are laid in as they are needed; this trellis is supported on four short stakes stuck into the bed. But it may be asked whether a breakage of roots does not take place on the edge of the back flue as the bed subsides? this would certainly take place, but is prevented by a few slates set along the edge of the flue to keep the dung and earth off it. This caution, however, is only required in one of the divisions of our pits, because the cavity in its flue is 5 inches, whilst the cavities in the others are only 2 inches, and that part of the flue on which the dung would rest is sloped off, so as to offer no obstruction. I may observe, that the back lining is the one on which most dependence is placed in keeping up the heat.—*Thos. Berry.*—Another correspondent, Mr. James Selsby, proceeds somewhat differently:—To prevent the Melons from leaving the glass as the litter sinks, I make a false bottom eighteen inches from the glass, consisting of joists let into the front and back wall. The joists are about twelve inches asunder, and upon them are laid hurdles, or if these are not at hand, sticks fit for hurdles placed about two inches apart will answer the purpose; and upon the hurdles, or sticks, must be laid thin turf, such as is cut for lawns, the grass side to be downwards, and the pieces placed close together, so as to keep down the steam which rises into the hollow space from below, and gets through the pigeon-holes from the linings. I find this plan answers better than a solid bed.—*James Selsby.*

Foreign Correspondence.

Paris, Dec. 27, 1843.—The observations in my last letter referred exclusively to the cultivation of Pines in the Kitchen Garden of Versailles, but I said nothing about the seedlings, of which there are a great number now coming into fruit. It would be difficult to determine, from the habit of the plants, from what kinds they were raised. I understand, however, that the whole are from the Enville, without artificial impregnation; if so, it is a sporting variety, for the greater part are very unlike the parent. Some have smooth leaves like Cayenne Lis, others large broad leaves like the Providence, with fruit of the Enville form; some like C. épineux, others like Anson's Queen; some in habit and fruit similar to Cayenne, and one very bushy plant with smooth leaves,

bearing two long and large fruits upon the same stem, in the form of the Enville, but much brighter in colour, and weighing about 8 lbs. each. Many seedlings have before been raised in these gardens, but none which they considered sufficiently distinct and good to name. I may mention, *en passant*, that the Banana House presents, just now, an interesting appearance; it is about 25 feet by 12, in it were planted last year, in the open ground, four suckers, all of which are now in fruit. On one of them I counted nearly 150 pods, which, when ripe, cannot weigh less than 30 or 40 lbs.; the plants have about 2 feet of soil upon a 3 feet bed of leaves. It is hardly necessary to refer to all the Pineries that I have visited; suffice it to say, the same remarks will apply generally to Meudon and Surennes, as well as to the growers for the market. In each of these places you find the open-frame culture, not only for young plants, but continued in the after stages, especially for the larger kinds.

I have before said that Peat is the principal soil in use; indeed, so general is this, that among the many public and private establishments which I have visited in France, I have never yet seen loam used in any one of them. In one or two you may see a few growing in sandy earth and rotten leaf-mould, and here and there peat and leaf-mould, but pure peat is everywhere to be seen as the favourite soil; this may seem strange to English growers, who have so long been accustomed to such strong soils as the Norwood loam; but, nevertheless, the fact is as I have stated. French growers will not use loam, some have told me that it has been tried upon Camellias and Roses, and that they have died under it; I even know an English gardener living with a lady of title, near Paris, who has adopted the same views, and replanted his Camellias in peat, after a trial of three seasons in loam. I have endeavoured to convince them that their want of success must have arisen from an improper use of loam in a sour state, but all to no purpose; their *amour propre* is as easily wounded in Horticulture as in Politics. They ask, are your Pines more healthy, or your fruit larger, than ours? and without waiting for a reply, tell you that they have seen Mr. Willmot's, Chatsworth, and other gardens in England and Scotland, and are satisfied that their plan is the best; this may be prejudice—perhaps it is so, but I apprehend that both Mr. Glendinning and Mr. Spencer would find some difficulty in combatting such evidences as 10 lb. Pines, which the French growers could produce in its favour.

The establishment of Versailles is, as I have before said, the largest in France, but that of Meudon is also remarkable for excellent culture and the high state of perfection to which this fruit is brought. This is one of the King's private establishments; the Château is never occupied by the Royal family, and M. Pelvillain, the chief gardener, is allowed the kitchen garden on his own account. The Pine is his hobby, and he spares no trouble or expense in bringing it to perfection; so ardent is his desire to obtain information, that he is learning the English language for the express purpose of reading our treatises and visiting our country, that he may be able to judge for himself of the advantages or defects of the different modes of treatment. He uses Peat, and also adopts the open ground culture, and certainly it would be difficult to find plants more vigorous, or finer fruit at Christmas, than he produces; it is no unusual thing to see in his houses Providence, Cayenne, and Envilles from 8 to 10 lbs. The Queens, however, are not large, certainly not more than 2 or 3 lbs. on the average; these last he grows principally in pots for the market; the confectioners of Paris seldom buy the larger kinds, they prefer a middle-sized Queen to any other; it would, therefore, be useless for him to take any extraordinary trouble in getting this variety very large. He has also raised several seedlings within the last four years, one of them was sent out about two seasons since; it is not, however, considered any great improvement upon the original. I know that many English amateurs and gardeners have from time to time visited Meudon, and they can bear testimony for or against the justice of my remarks.

MM. Goutier of Paris and Trueffaut of Versailles cultivate entirely for market; the former grows almost every variety, but I do not think his fruit so fine as at the before-mentioned places; this, however, may be on account of the little demand for heavy fruits. I have, nevertheless, seen excellent specimens in his houses. Pines are not sold in Paris by weight, and therefore he has no particular inducement to obtain them above the usual size. He has likewise raised a great number of seedlings from the Enville, which bear a striking resemblance to those obtained at Versailles; the same diversity in habit and fruit is apparent, and it is somewhat singular that so many, in both places, should have smooth leaves; because, at the time the seed was perfected, the Cayenne Lis was but little cultivated. At the last Paris show in September, M. Goutier obtained the large silver medal for two of his seedlings, and you will find a description of the fruit in my letter of that period; among other of his seedlings I noticed one having a long Enville-shaped fruit, of a greenish orange colour, weighing about 5 lbs.; another named Prince d'Essling, having large and long fruit of about 7 or 8 lbs.; another with smooth leaves and very long sugar-loaf fruit, about 12 inches long, weighing, I think, 7 or 8 lbs.; another named Enville Pelvillain, with very large fruit, said to be of a finer flavour than the old variety; there were five or six others with large fruit, all varying more or less in habit or fruit from the parent. M. Trueffaut fruits about 400 Pines annually, all of which, with the exception of a few Cayennes and Providences, are Queens; about 100 are fruited in the open ground, but I do not perceive any very marked difference between them and his Queens in pots; in fact, he says there would be no pecuniary advantage to him in producing large fruit; he finds a ready sale for ordinary sized Queens at 10 and 12 francs, while the larger kinds are seldom asked for. He, however, is decidedly in favour of open frame culture for all varieties of young plants, and for the fruiting of the varieties before mentioned. Such is the result of my observations, and I think it will be conceded by all that French cultivators are entitled to no little credit for the introduction of this system; it is a common saying in this country, "that the French invent, but the English practise and reap the benefit." I doubt not it will so be in this instance, for I feel satisfied that, *malgrè* the climate, there will be larger fruit produced under this plan by Messrs. Barnes, Spencer, and others, than has ever been seen here. Not only can England boast of the most skilful practical gardeners, but she enjoys peculiar advantages from the great perfection to which her heating by hot water is now brought, and should Rendle's tank system be found as favourable as he supposes, I shall not be surprised to read before long of prizes being awarded for Pines weighing 12 or 15 lbs. each.

Societies.

MICROSCOPICAL SOCIETY.

Jan. 19.—J. H. Bowerbank, Esq., in the chair. There being no paper Mr. John Quekett, the Secretary, made some observations on the structure of a fossil human bone found in a bog. He stated that many attempts had been made to inject artificially the Haversian canals of bone, but had failed; but in this instance the medullary canal, the Haversian canals, and the osseous corpuscles were beautifully injected. Dr. Goodfellow stated that he had seen preparations of Mr. Tooms, in which he had succeeded in injecting artificially the Haversian canals and osseous corpuscles. Mr. Dalrymple said, with regard to the structure of the Haversian canals, he had not only seen vessels running through them, but vessels lining their walls. Mr. John Quekett also made some observations on the analogy between the structure of the air-bladder of the eel and the lower part of the lung of the Chamæleon, thus proving the respiratory function of the air-bladder as well as its structural analogy with the lungs. These remarks were illustrated by microscopical specimens.

Reviews.

An Introduction to Practical Organic Chemistry. 12mo. Pickering.

Why this should have been called an introduction to *practical* chemistry we are at a loss to understand, for it is anything rather than that. It is, in fact, an exposition, in few words, of what the author conceives to be the modern *theory* of organic chemistry, taken from the writings of the more conspicuous of modern investigators. In some respects the author has performed his task with skill, and has made it a real assistance to those who are labouring to infuse some idea of the nature of chemical investigation into the rising generation. In other respects he has been less successful. For example, the questionable, if not fallacious, doctrine of root-secretions is now, in 1844, treated as if it were a matter beyond all doubt, and the ten times refuted speculations of geologists as to the presence of enormous Ferns in the beds of coal are regarded as so many facts about which no doubt can be entertained. In another place we are assured that pruning fruit-trees makes them bear more abundantly, which we believe is the reverse of the fact. Pruning does not produce abundance, but it improves quality.

What we most approve of is the skill shown in demonstrating the truth of the Mosaic history of the creation by the evidence of modern science. "Let us consider," says the author, "the apparent course of creation as these sciences—chemistry and geology—present it. From the seething matter of volcanoes, carbonic acid, combinations of ammonia in a gaseous form, chiefly carbonate of ammonia, and aqueous vapour are evolved, *i. e.*, gases composed respectively of carbon and oxygen, and hydrogen and nitrogen, or a combination of both, but none of them capable of maintaining animal life; and steam, which is a compound of oxygen and hydrogen. Plants sprout from the earth, and find nourishment for the most luxurious growth in the gaseous products of the heated mass. The remains of enormous Ferns found among deep beds of coal, showing the latter to be the produce of a former vegetation, prove how immense a portion of vegetable matter was produced from gases which no animal could have breathed. The absorption of carbonic acid, with the consequent return of a large quantity of pure oxygen to the atmosphere; the greater affinity of hydrogen for the oxygen thus presented than for nitrogen, especially when heat acted in the decomposition of ammonia, which would then set free its portion of nitrogen—brought the atmosphere apparently in the course of time to its present composition; and animals then stepped forth upon the earth, to breathe the air, and consume the food already prepared for them. Such is the account which science would give; it differs in nothing from that of Moses."

To our minds nothing can be more satisfactory than this, with the exception of the romance about Ferns, and we accept it as a sufficient atonement for errors on other points.

Miscellaneous.

Mode of ascertaining the Quality of Seeds.—Such seeds as do not naturally require a very long time to germinate, are sometimes readily examined, as regards their goodness, by being placed in hot dung. The following particulars of the mode indicated by General Ygonet is recorded in the "Revue Horticole." A pinch of seed is sown in a pan, which is plunged in fermenting horse-dung, the seed being covered with nearly half an inch of soil, and over this rather more than an inch of dung.‖

Swan River Vegetation.—Labiatæ, &c.—We have several fine species of Hemiandra, Hemigenia, and Atelandra. There is also a species of Westringia, a Mentha, nearly allied to Pennyroyal, and several showy plants with a calyx like Scutellaria.—*Drummond, in the Inquirer.*

JANUARY.

By the Author of "Rural Sonnets," "Spartacus," "Regulus," and other Tragedies.

Hardy as yon fresh Bays upon his brow,
With full-blown Laurustinus interweav'd;
Ere yet the husbandmen resume the plough,
Or festive days by labour are retriev'd—
Lo! *January* leads the young New Year,
Happy in welcomes, and with hope elate,
Tho' round its form cold winds and clouds career,
And barren would appear its first estate.
Now—if the weather freeze, or bind the ground—
Manures are carted, and the routes repair'd:
In forest-haunts the woodmen's strokes resound:
For earliest produce gardens are prepar'd:
And here and there just peep above the soil
Signs of the life wherewith vast Nature's womb doth toil.

J. Jones, Inner Temple, Jan. 20, 1844.

CALENDAR OF OPERATIONS

For the ensuing Week.

I.—HOTHOUSES, CONSERVATORIES, &c.

This is a good time to remove dormant bulbs and tubers to a forcing-pit, such as the many varieties of Hippeastrum. If these have been put to rest in their pots it is best not to disturb their roots at present; if they want larger pots shift them when they are in full growth next month. Some of the different Gloxinias and a few of the Achimenes may also be set to growing: these do best potted at the time they are started. Some of the Gloxinias are apt to damp off, if water lodges in the crown of their tubers. Seeds of stove plants or from foreign parts may now be sown in well-drained pots in peat and sand; the soil for valuable seeds ought to be prepared after Mr. River's manner, if only to kill eggs of insects, seeds of weeds, and to expel dampness. Look over all plants regularly, and let everything be clean about them.

Conservatory.—Where forced flowers are introduced less air should be admitted than for a collection of conservatory plants. See particularly that Orange-trees, Neriums, and other plants are clear of insects before they begin growing, as young wood and foliage are very difficult to clean without injury. Most conservatory plants, being in large pots and boxes, require less water than those in smaller pots in the greenhouse. Rhododendrons and Azaleas are among the finest and easiest plants to force for the conservatory, and seeds from forced plants of them crossed are always more to be depended on for novelties than those from the open ground.

Greenhouse.—Seeds of Heaths, and of all woody half-hardy plants may now be sown and reared in hot-beds or stoves; but it is too soon to sow them where such conveniences are wanting; this is also about the best time to sow Rhododendron and Azalea seed, especially the finer sorts; seedlings of them of last year might now be forced, and afterwards hardened off before next May, when they might be planted out in cold frames or sheltered beds. This treatment brings them sooner to a flowering state, they also make finer plants. Keep greenhouse plants from growing yet as much as possible.

Forcing Pits.—Many other plants besides those for forcing might be brought to make an early growth in these pits. The Paulovnia should now be set to growing as a forcing plant; as soon as the blooms are ready to expand the plants should be removed from close heat to a more airy situation for a day or two before they are brought to the conservatory or sitting-rooms; syringe this pit at least once a day, keep the plants free from insects, and introduce as many plants as you can spare for experiment. There are many plants probably that will force well which have not yet been tried.—*D. B.*

II.—FLOWER-GARDEN AND SHRUBBERIES.

Out-door Department.

Never had we such a fine season for out-door improvements or alterations; but tender plants are in a very forward state, and it is necessary to keep them securely protected at night, as frost may come upon us when we little expect it. Many plants, such as the Tree Pæony, Magnolia conspicua, and some of the more hardy of the Himalayan Pinuses, are in a very forward state, and will require watching, or we may lose a season's growth.

Reserve-Garden.—A part of this garden should, in all large establishments, be devoted to the rearing of evergreen shrubs, such as Laurels, Rhododendrons, Kalmias, Yews, Laurustinus, &c., which may be propagated at home, or bought in from the nurserymen when a year or two old, at a very trifling cost. They come in very handy when making improvements, and are sure to grow from being habited to the soil and climate of the place. There are not many places where a few thousands of these might not be planted with great improvement to the grounds.

Pit and Frames.—Protect securely at night, but give all the air possible in the day-time. Calceolarias, Heliotropiums, &c., may be potted off preparatory to being hardened for the flower-garden. Should the weather send the men in doors, a few barrow-loads of pegs may be cut, of various sizes, ready for pegging down shrubs, Roses, Verbenas, &c. &c. Besoms may also be made of various sizes, and flower-sticks pointed, straightened, tied into bundles, and laid up to dry.—*W. P. A.*

III.—FLORISTS' FLOWERS.

Auriculas may now be top-dressed, removing carefully the surface-soil, and substituting some two-year decayed hotbed manure and leaf-soil. Avoid all hot, stimulating composts, for though they may increase the size of the flowers for the present season, yet it is "*a food*" so uncongenial with the nature of the plant that the foundation of future disease will be most assuredly laid.

Polyanthuses grown in pots may be kept moderately moist, and a similar top-dressing as that recommended for the Auricula will be of infinite service to them. They are, however, grown on beds, with a north-east aspect, with great success. A cool bottom, either natural or artificial, it must be borne in mind, is a *sine qua non* for their perfect cultivation.

Carnations.—Still give all air possible. If the green-fly begins to be troublesome, remove it with a camel-hair brush.

Pinks.—As spring advances the wireworm gets more active and mischievous. If you have reason to suspect that any of these lurk in your beds cut a Potato into quarters, inserting a skewer in each; place them in various parts just below the soil, and examine them daily. This is an effectual trap.

Tulips.—We have as yet had but little frost or wet to affect these flowers. As they advance they will require strict attention to the precautions before directed.

Ranunculuses.—In selecting roots for blooming choose those with a high crown in preference to size. The following are a few that will make an improvement in any collection:—Tyso's Edgar, yellow, edged with puce; Costar's Apollo, crimson self; Mr. Welch, white, edged with deep pink; Madeline, white, beautiful rosy edge; Bartlett's Charlotte, superbly mottled; and Esther, white, purple edge. The old flowers—Naxara, splendid dark; Socrates, olive; and Le Temeraire, pink stripe—still continue the best in their respective classes, most of the new seedlings being either edged, spotted, or mottled.

Pansies are showing a tendency to bloom, arising from the

past mild weather. They will be better removed as they advance.—*J. F. W.*

IV.—PINERIES, VINERIES, &c.

Pinery.—If in looking over the succession plants any are observed to be unhealthy, the sooner they are disrobed and repotted the better, choosing a mild day for the operations. They will soon begin to make new roots in the fresh soil, and will be re-established before the sun has much power. Those plants that are in good condition at the roots, and not likely to require the soil to be shaken from them, but merely shifted into larger pots, will do better if this is deferred until the beginning of March.

Vinery.—If there is ample means of obtaining a moist atmosphere, it will be necessary to pay some attention to this point during damp close weather; as it is possible to have more than is necessary for the health of the Vine after it is in leaf. Keep watch sticks in the fermenting material upon the borders, and examine them frequently to see if the heat is regular; 80° of heat will be a good medium.

Peach House.—A small portion of air admitted throughout the day, during the blooming of the trees, will prove beneficial. The bloom will be stronger and of a finer colour, and the fruit will set better. Peach-trees generally set their fruit best in houses not closely glazed, and this affords us a lesson.

Fig-House.—As the young Figs begin to swell, increase the temperature 2° or 3° in a week, till it reach 60° or 65°, with a rise of 5° to 15° by day, according as there may be sunshine or not.

Cherry House.—From the time the bloom begins to expand, do not syringe till the fruit is set; keep a steady heat of 55° by night and 60° by day. Ventilate as directed for the Peach-house.

Strawberries.—See last week's Calendar.

Melons.—Prepare now a bed of well-fermented dung and leaves for planting out upon, using faggots of brush-wood for the first 2 feet in height.—*G. F.*

V.—HARDY FRUIT AND KITCHEN GARDEN.

Planting.—Prepare the ground for those fruit-trees the planting of which could not be effected in the autumn, by thoroughly draining the borders and forming a substratum through which the roots will not easily penetrate. In the absence of paving-stone, tiles, &c., a good substitute may be formed of coarse gravel and finely-sifted quicklime, in the proportion of six of the former to one of the latter, mixed well together with a sufficiency of water, and laid down to the depth of four or five inches. From 15 to 18 inches depth of soil will be sufficient for Peaches and Apricots; much less will do, if the borders are mulched and cropping dispensed with. No manure ought to be mixed with the soil.

Cucumbers.—Prepare fermenting materials for their growth in frames. Those who wish to have them early will have commenced long ago.

Routine Management.—Dig, ridge, and turn up all empty ground in this favourable weather. Give plenty of air to all advancing crops in frames. Clean and stir the soil among all growing crops in the open garden; remove all decaying leaves, keep the walks and borders in good order, and render the kitchen garden not merely an object of necessity, but of *sight* and interest.—*R. F.*

VI.—ARBORICULTURE.

Old Woods.—Proceed with the works previously pointed out—such as felling trees not wanted for the bark, planting fresh ones where required, relieving others from the overgrowth of adjoining trees of less value, and training any young promising plants by taking off or shortening any side-branches at some distance from the stem, that are not over large, so as to cause a wound that would not soon heal over. When a young thriving tree is near to one that should be cut down in a few years, much good would result if some of the branches of the tree intended to be removed were shortened in a little, to make room for the branches of the young one.

Coppice.—Such stuff as is not likely to be saleable, namely Hawthorns, Briars, Brambles, Honeysuckles, and things that spring up and injure good wood, should be kept under. Proprietors of woods are not aware of the loss they suffer by not attending to this.

Young Plantations.—In addition to what I advised last week, when thinning and training young plantations, a person with a light ladder and a narrow hand-saw, about a foot or 14 inches long, would be beneficially employed by taking close off some or all of the very strongest side-branches. Many that would have been fine trees are entirely ruined by neglecting this until it is too late. This operation would prevent all future LOPPING of trees.

Hedge-Rows.—The same care and attention to dressing hedges previously mentioned should be attended to as respects maiden plants. Continue to plant others where necessary, if you have suitable well-prepared stocky plants. When planting trees in hedge-rows exposed to strong winds, give them a little inclination towards that point, and put a firm sod on the opposite side close to the stem.

Nursery Stock.—Proceed with all necessary work in taking up trees for replanting, preparing ground for seeds and plants, and begin planting seedlings and cuttings of larger plants in rows in dry ground.—*W. B.*

VII.—COTTAGERS' GARDENS.

As the weather still continues favourable, the cottager, if it is not already done, should proceed with trimming and cleaning out any hedges that are under his care, before the season commences, when other things will occupy all his spare time. As neatness should always be a leading feature in a cottager's garden, everything that can be done to promote this should be forwarded now, when little else can be performed. Anything that appears unsightly, and that will make manure, should be removed to the rot-heap, which should be turned over occasionally and covered with a little soil; this prevents all noxious effluvia from escaping. The soil also mixes among the decaying vegetables, and becomes excellent compost. Soap-suds have a good effect on many kinds of vegetables, and should not be thrown away; they act beneficially on soils where Cabbages are infested with the club, and in some instances have been known to entirely cure that disease.

Vegetables.—A sowing of Radishes may be made on a warm border, but they must be protected from frost by covering the bed with straw. If any digging or trenching yet remains to be done no time should be lost in getting it forwarded while the weather will permit.

Fruit.—In pruning Gooseberry and Currant-bushes care must be taken to thin them well out in the centre, so as to admit plenty of sun and air. The same remark is also applicable to standard Apple-trees; the middle of the tree must be kept quite open, taking care that all the branches lead outwards, and preserving a regular distance from each other. Pear-trees should also be thinned well out, and the produce will be much better in quality.

Flowers.—Pelargoniums, Fuchsias, &c., in pots, should have as much light and air as possible; they should be sparingly watered, and this ought always to be done in the morning; if they are inclined to grow up tall and slender the points of the shoots may be pinched off by the finger and thumb, and this will induce them to throw out side branches, and make them dwarf and bushy. Anything that is likely to be injured by frost should be carefully watched and protected from it by straw or fern.—*Mc H.*

State of the Weather near London for the week ending Jan. 25, 1844, as observed at the Horticultural Garden, Chiswick.

Notices to Correspondents.

MR. PAXTON'S COTTAGER'S CALENDAR.—At the earnest solicitation of many of our Subscribers, we have determined on again reprinting Mr. Paxton's "Cottager's Calendar," in the form of a small volume, for general distribution, price 3*d.* each copy. It may be ordered of all booksellers. Gentlemen wishing to *distribute copies* among their cottage tenantry, may have them *delivered in any part of London*, by remitting a post-office order to this office, at the rate of 5*s.* for every 25 copies.

OUR CORRESPONDENTS will oblige us by not mixing together Agricultural and Horticultural questions, and by writing them on one side of the paper only. Such precautions can give them no trouble, and will save us a great deal.

COMMUNICATIONS from the following CORRESPONDENTS are in type, and are only waiting till room can be found for them:—*Martin Doyle, Gr., W. Billington, I. W. K, Vitis, J. Wighton, A Friend to Floriculture, O., J. L. Snow, G. Thompson, J. Paxton, A Practical Man*, and *P. Mackenzie.*

ANEMONES.—*H. B.*—The unusual mildness of the season, together with the close covering applied too early, have caused a premature growth in your roots. On discovering this disaster, the better treatment would have been to have removed the litter by degrees, in order to harden the tender shoots gradually. By their complete exposure, it is probable most of them will perish; a little time will show you whether it will not be better to sacrifice the bloom for this season, in order to strengthen the roots for another year. At present, you must cover the beds with litter at night, and in severe weather; give all the air possible when the weather permits, and keep mats in readiness as an additional covering in case of frost.*

BOOKS.—*H. V. Denny.*—Mr. Loudon's contributions to "Brande's Dictionary" cannot be purchased separately. His "Suburban Floriculturist" never appeared.——*One* should procure "Parnell's Grasses of Scotland." We are not carpenters, and cannot answer the other question. He who expects to learn to cut out wood by books will be very likely to cut his fingers.——*Pruning Knife.*—Mr. Loudon's "Suburban Horticulturist" probably contains the information you want. Some day, when we have not so many other things to do, we will give a series of articles on the subject. The first principles of pruning will be found in the "Theory of Horticulture," but, we confess, treated too concisely, even as a matter of theory.

CAMELLIAS.—*E. R.*—Camellia alba-plena and C. fimbriata alba are perhaps the most delicate varieties in cultivation. The reason they are so apt to drop their flower-buds is owing to too many being left on the plant. It is not uncommon for some Camellias to produce twice as many flower-buds as they have strength to expand; then the consequence is (if not picked off at an early period), they will drop off, and those that remain will very often be deformed or diminished in size. This may also be the reason why your C. eximia has not proved true to its character this season. If we wish good blooms we cannot have many on a plant. Wherefore Camellias' sport is uncertain. It is owing to the presence or absence of colouring matter secreted in the cells of which the petals are composed; but the agents upon which these phenomena depend are unknown. We not unfrequently see on C. Donckelaeri on the same twig one flower pure red and another blotched with white, without any apparent cause. §

CHARCOAL.—*J. A.*—Add to the soil of your Pelargoniums one quarter of charcoal in coarse pieces. We do not like the fine powder. We have, however, never seen this substance tried on Pelargoniums. If you want to make them grow very large strew the top of the soil with burnt bones, and moisten the bones with oil of vitriol just when they are beginning to grow.

COMMELINA CŒLESTIS.—*Flora.*—The roots of Commelina cœlestis may be planted out into a tolerably-rich bed about the middle of April; they may either be taken up in autumn or protected by covering the ground with ashes, leaf-mould, or sand; but to take them up is the best way to insure their safety. Pavonia tigridia will succeed planted out in the open border in summer.‡

FRUIT-TREES.—*Banffshire.*—The cheapest and only way of clearing your "Berrie bushes and Apple-trees" of lichen is, thoroughly draining your land, which will produce other advantages besides. We do not know what the Corn grub is. The Gooseberry Caterpillar may certainly be killed by White Hellebore powder, *if it is fresh.* The transformations of the latter are described at p. 515 of 1841.——*Morley.*—Peach, Nectarine, and Apricot trees, round which a trench was made and filled with rotten dung unmixed with soil, will be apt to gum in consequence. ‖

GLOXINIAS.—*M. A. G.*—These cannot be raised in a greenhouse, as they require a temperature of about 60°; but by starting them about the beginning of March, and growing them in a hot-bed until they show signs of flowering, you might perhaps be able to bloom them in a warm corner of a greenhouse during the summer months. While they are in the frame great care is required to keep them from damping off, they must not be overwatered, and air should be regularly given them when the weather will allow. ‡

HEATING.—*Amateur No. 1.*—Water will not shrink in gutters, but it wastes by evaporation and insensible leakage. If you don't want to use your pit in winter you may lay your slates on the gutters without bedding them in cement; but if it is to be used for winter purposes the slates must be bedded in either cement or mortar, or the pit will prove too damp.——*Amateur No. 2.*—We see no objection to such a boiler as you mention, but we are unacquainted with it. In consequence of your having mixed up other questions with this, we had overlooked the latter, and must defer answers till next week. Azaleas and Rhododendrons do not like dry banks, they prefer moist situations; they may, however, be made to grow by the use of abundance of cow-dung.——*Suffolk.*—We should say that a pit 3 or 4 sashes long would be the smallest to which any hot-water heating can be advantageously applied. However, if you can adapt an iron saucepan to the gutters in the little pit you wish to build, and don't mind some waste of fuel, you may perhaps get the heat you want without much trouble. Or if you can get an old iron manger with square sides it would be easier to fix the flow and return pipes to it. Or an iron 4-inch pipe, closed at the end in the fire, and slanting upwards into your gutters will do, without any return-pipe at all. Ingenuity will vanquish many difficulties.

INSECTS.—*H. H.*—The animals attacking your greenhouse plants, Cabbages, &c., are the Snake Milipedes. They were described and figured in the 1st vol. of the *Gard. Chron.*, p. 196, and some means for their destruction was suggested. As their history will shortly be given in the "Journal of the Royal Agricultural Society," any information regarding them will be very acceptable at this time to Mr. Curtis.——*A Subscriber.*—No. 1 is a Millipede, called Julus terrestris or an allied species; 2 is the wireworm—the property of increase by division is entirely fabulous; 3 is the chrysalis of a Noctua, but of what species it is impossible to determine without hatching the moth, as the pupa has been killed by pressure; 4, Curculio (Strona lineata is one of the Weevil tribe; 5, pupa of some fly, like Musca domestica, and generated in the dung of animals, or amongst bones. The last animal alluded to by you may be a Lepisma, but without seeing specimens it is not in my power to speak with certainty. *R.*——If *Lactuca* will forward some of the infested seeds and insects to Mr. Curtis, his queries will be answered; but without these materials it is neither possible to investigate this important subject nor to form a correct opinion of the remedies. *R.*

LILIUM LANCIFOLIUM ALBUM, &c.—*A. B. D.*—I have grown this in the open air for two years, and consider it quite hardy. Last season I had a bed containing about 150 flowering bulbs, which bloomed much better than the common kinds of Lilies; and had it not been for the unfavourable weather of last spring they would have been excellent, but on this account were comparatively short; and some of the foliage and a few of the flowers were injured, but not so much so as the common Orange Lily. The bulbs lifted quite well both seasons, and did not lose a single root from frost. L. lancifolium punctatum I have not tried in the open air, but no doubt both that and rubrum would do equally well. L. eximium and longiflorum are very much alike in general growth, and the treatment that would suit one will suit the other. They will grow and bloom well in the open air, but the foliage is sometimes damaged by wet and spring frosts; they appear to be earlier than L. lancifolium album, and not quite so hardy; but this may arise from their coming above ground earlier in spring. The principal injury is done when the plants first begin to expand their foliage, occasioned by wet lodging between the leaves and becoming frozen, by which their vessels are ruptured, and disease is the consequence. This shows itself in brown blotches on the foliage. A light sandy peat mould is the best soil for these bulbs.—*H. Groom.*

MELONS.—*Ruricola.*—We are at all times willing to answer reasonable questions, or even unreasonable ones, if it is possible; but we cannot print a treatise upon cultivating every sort of plant that our correspondents may inquire about, nor go, in these notices, into long discussion about questionable points of physiology. There are moreover certain things which all men interested in gardening are expected to know, and we can no more undertake to explain such matters than we can teach the A B C of reading. You had better consult some book on the cultivation of the Melon, unless you find an excellent article in to-day's Paper sufficient for your purpose. As to the causes or supposed causes of disease, we trust you will get some information upon that point in leading articles during the present year. The mode of destroying Thrips mentioned at p. 649 of our last volume is this: dust the leaves of your Melons over with flowers of sulphur, and let it remain for a few days; then give them a good washing with the syringe.

NAMES OF PLANTS.—*A Rector.*—Epidendrum viscidum.——*F. J.*—Starjelly is probably the Nostoc commune, a gelatinous plant allied to Laver, the green slime of ponds, and similar productions. We *cannot*, however, answer your inquiry positively without seeing the substance.——*A. K.*—Hypnum serpens, not curvatum. We cannot undertake to occupy ourselves in naming Cryptogamic plants.——*A Constant Reader.*—Erica bicolor.——*W. Billington.*—Pelexia trifloba.——*G. Thompson.*—1, Gesnera Douglasii; 2, 3, 4, Gesnera bulbosa.

POTATOES.—*W. H.* thinks that because gardeners are often blamed for the bad quality of Potatoes which unskilful cooks cannot dress, therefore gardeners ought to be allowed to cook Potatoes themselves. We submit this proposition to the consideration of "W. H.'s" brother gardeners, who would, no doubt, be greatly flattered at being transferred from the garden to the kitchen. It strikes us, however, that it would be better to tell cook not to boil them in too much water, to give them a little salt, and when they are boiled enough to pour off the water, cover them with a cloth, and leave them on the hob to dry a little.

PRESERVING CUT-FLOWERS FRESH.—*A curious Observer* cannot do this beyond a very few days, by any process. To put them in a close tin box cannot have any other effect than that of rotting them. The water that was found when the box was opened resulted from the decay of the specimens.

RATS.—If a *Caledonian* will give us the information he offers we shall be obliged. It is not worth discussing questions of this sort. Facts, and facts alone, are useful.

ROOT-PRUNING.—*A. B. D.*—This must necessarily answer equally well with all over-luxuriant trees, if not overdone, as is sometimes the case. As for the Fig, in a climate like this, it should be so treated every year or two.

VERMIN.—*Poor Robin.*—Your plants are infested with Green-fly, which you must kill with tobacco-smoke. You may also try gas water on those which are hard-wooded, in the manner described at p. 545, 1843; but be cautious, for some things will not bear it. Blackbirds are easily caught in rat-traps, baited with Beans or Peas; that is the best mode of destroying them. It is of no use to waste time in popping at them, for they soon get too cunning to be had in that way.

VINERY.—*J. J.*—We would try a good top dressing of superphosphate of lime, applied just when the buds are beginning to swell.

VINES.—*John Abel.*—The Muscat Escholata is the same as the White Muscat of Alexandria. The Escholata superba is perhaps the Black Muscat of Alexandria. ‖

MISCELLANEOUS.—*A Correspondent.*—A list of the Horticultural Society may be had upon application to the Secretary.——*A Subscriber.*—You may head down Yews and Hollies now. The difference between Charcoal-dust and rough pieces is this, that the latter keeps the soil open, and the former renders it compact—a very important distinction.——*Jurens.*—Ipecacuanha Learii will answer your purpose. Moles are only advantageous in compact soil which wants loosening. We do not know what good they can do on light well-drained land.——*A Subscriber.*—In the centre of a pit in your conservatory you may plant Luculia gratissima.——*Anonymous* asks questions which require much time to answer, and therefore he must have patience, till we can find time to consider his inquiries.——*R. T. B.*—More warmth and less water at the roots will restore your Geraniums to better health: look to the drainage.——*W. R. G.*—We fear you have no remedy. At least it is not in London that the remedy can be found. Why not raise your seedlings yourself? It is the only way.——*Inquisitor* will find a list of plants suitable for a flower-garden, all dissimilar and showy, given at p. 681, vol. 1843. ‡——*Juvenis.*—It is.——*Pedes.*—We do not know any one who would exchange seeds for your Number.

*** As usual many communications have been received too late for answering this week.

ERRATA.—In the article on Bees, p. 37, col. *b*, instead of "the struck hive," read "the sticked hive"—or hive with sticks in it.——In the paper on Colour of Carnations, p. 22, line 43, instead of "The flowers were evidently attractive, for a Florist visited the garden without pausing before them," read "a Florist" &c.

DRAINING.—JOHN DAVIS, Mathematical Instrument Maker, Derby, begs to direct the attention of Agriculturists to a very efficient and simple Level he has just constructed, especially for Draining. The private Farmer or the professional man will alike find in it all that is desired. The Instrument is fitted in a case, and sent to any part of the country for the price, 3l. 5s.

TO GARDENERS AND AGRICULTURISTS.

SUPER-PHOSPHATE of LIME is capable of producing a more rapid vegetation in Plants than any substance known. It may be had at Mr. LAWES' Factory, Deptford Creek, price 7s. per cwt.

Phosphate of Potash	. . .	15s. per cwt.
" Soda	. . .	12s. "
" Magnesia	. . .	9s. "
" Ammonia	. . .	1s. per lb.

The Agricultural Gazette.

SATURDAY, JANUARY 27, 1844.

MEETINGS FOR THE TWO FOLLOWING WEEKS.

Tuesday, Feb. 1 . Agric. Imp. Society of Ireland . 2 P.M.
Wednesday, Feb. 7 . Agricultural Society of England. Highland and Agric. Society.
Thursday, Feb 8 . Agric. Imp. Soc. of I eland.

In the present Number of the "Quarterly Journal of Agriculture" there is an interesting paper by Prof. Johnston on "THE MANURING AND STEEPING OF SEEDS." The facts there recorded, and the manner in which they are shown to be what the known laws of Vegetable Chemistry and Physiology would lead us to expect, combine to render this a subject to which the experimental Agriculturist may usefully direct his attention.

The advantage of steeping seeds in certain chemical solutions seems to have been first pointed out by F. H. Bickes, of Castel, near Mayence. He announced his discovery in a lately-published pamphlet "On the Cultivation of Soil without Manure." Notwithstanding the extravagance indicated in its title, and which characterises it throughout, this publication records some surprising facts and testimonials on this subject; and these have lately been corroborated by the experiments of Mr. Campbell, of Dundee. A letter descriptive of the method of doctoring seeds adopted by the latter gentleman, and of their consequences as exhibited in the growing plants, has just been published in the Transactions of the English and the Highland Agricultural Societies—an extract from it will be found in another column. Mr. Campbell's experiments were performed upon seeds planted in the clay taken from eight feet below the surface of the ground; and though under such unfavourable circumstances, the Wheat plants from them tillered into five or eight stems, while those from unprepared seeds had only two or three stems apiece. *That*, however, which is broadly asserted in the German pamphlet is also hinted at by Mr. Campbell—viz., that steeping seeds in suitable solutions will render all future application of manure unnecessary. This is a statement which no practical farmer can for one moment entertain, and therefore we are glad that it is not necessary to suppose it to be true before we can believe that this process may sometimes be beneficially adopted.

It seems probable, that by some such means as those suggested by Messrs. Campbell and Bickes, the period of germination, which is one full of danger to the young plant, may in many cases be shortened; and this is very desirable, for, owing to the conversion of the starch of the seed into sugar, which is then proceeding, the plant is at that time liable to attacks from all sorts of vermin. In the case of the Turnip, especially any means which would hurry it through this period into the rough-leaved stage of its growth would be most useful, as it is only when its leaves are still sweet that it is liable to the attacks of the fly.

But from the results of some of Mr. Campbell's experiments we may infer that the influence of his process extends into the future history of the plant much beyond the period of its germination; and it is on this account that we would recommend it now as a suitable subject of experiment for Wheat growers. The mineral ingredients of Wheat amount to about one-fiftieth of its weight; and, from the mere fact of their existence in the seed, it is probable that they exert an important influence over its germination and future growth. Any artificial addition to their quantity—and, by soaking the seed in certain solutions we can double the natural quantity of its mineral constituents—will therefore increase that influence.

The following are substances which, besides the four elements composing its organic structure, are to be found in Wheat:—soda, potash, lime, magnesia, sulphuric acid, phosphoric acid, silica, alumina, and chlorine.

It would probably not be difficult to dissolve in water such matter in such quantities that the solution should contain in their natural proportions all these mineral substances; so that the heat, by being steeped in it, would merely increase the *quantity* of its mineral ingredients, without at all disturbing the balance among them which Nature assigned; and perhaps this would be the best of proceeding; but as it is interesting to know the individual effects and relative value of different substances as manure, we intend to try a series of experiments on the subject, confining ourselves in each to the application of only one of the salts, in the form of which the above substances must be employed.

For those of our readers who may not yet have got in all their Wheat, for we by no means wish that it should be a mere garden experiment, we shall first state the plan we propose to adopt, and should our example be followed by any one, we shall be happy to report next autumn the results of his experiments, along with those of our own.

It is intended to soak for 48 hours previous to sowing, eight parcels of Wheat—say one bushel apiece—each in a solution, to be obtained by dissolving 5 lbs. of one of the following substances in such a quantity of water as may be necessary thoroughly to cover the seed.

The prices per lb., placed opposite these substances, are such as will be charged by any *wholesale* chemist of whom they may be ordered.

Silicate of soda	0s.	6d. per lb.	Phos. of ammonia	2s.	6d. per lb.
Nitrate . .	0	3 "	Sulphate . .	0	3 "
Sulphate of soda	0	3 "	Muriate . .	0	8 "
Phosphate .	1	6 "	Nitrate of Potash	0	4 "

The Wheat, after being thus treated, will be hoed in at the rate of two bushels of the dry seed per acre, in drills nine inches wide, and a ridge sown with Wheat in the ordinary way will be left as a standard of comparison between each couple of adjacent plots. The extent of the experiment, for those who may not wish to hazard so extensive a trial, might be reduced one-half without perhaps much impairing the value of its results.

WE have no wish to enter upon the question, WHAT WEEKLY SUM IS A JUST AND SUFFICIENT WAGE FOR AGRICULTURAL LABOURERS? nor shall we attempt to determine whether the consideration of such a question would be practically useful—whether, in fact, the lowness of wages is, in the long run, at all dependent upon the will of the employer; but there is one subject arising out of the relation existing between master and servant which we are anxious should be thoroughly discussed in our columns, and we shall therefore make a few remarks upon it, in order that others may be induced to take the matter up. We allude to the POLICY OF PAYING FOR WORK BY THE PIECE.

This mode of payment might be advantageously adopted more generally, and for many more farm-operations than it now is. During the past year we have paid by the piece for turning dung in the yards, for filling it into carts when ready for spreading on the land, for hoeing Wheat and other grain crops, Turnips, and other roots, &c.; for harvesting Corn, *i. e.*, cutting, tying, and stooking it; for pitching and loading the Corn in the fields on the cart, and pitching it to the builder on the rick in the stack-yard, and for harvesting all sorts of roots, *i. e.*, with respect to Potatoes, for digging and pitting them; and with respect to Turnips, Mangold Wurtzel, and Carrots, for pulling them, cutting off their tops, and loading the roots in one set of carts, and the leaves in another. If we except horse-labour, the greater part of the work on the farm was thus paid for by the piece; and there is this advantage in this system, that activity and spirit on the part of the labourer are thus insured by the powerful principle—*self-interest*.

It is of importance in certain complicated operations of husbandry, in which it may not be possible to manage it wholly thus, that at any rate *one* of the branches of which it consists should be paid for in this way. By so doing—to take the case of the preparation of Turnip-land under drill-husbandry for the seed—the men at the dunghill who are loading the carts being kept vigorously at work by self-interest, and all the other operations being dependent on them, those who are carting, the men who are spreading the dung in the drills, and even the ploughmen who are opening fresh drills and covering the dung in by splitting the old ones, are forced to proceed with proportional activity—an activity, too, which is not merely the result of necessity, but the consequence in some measure of interest in their fellow-workmen, whose wages depend on their keeping them fully employed. Similar cases to this occur at harvest-time, when those who pitch the corn to the cart and to the rick are paid by the acre of ground cleared, all the others being employed at day-wages; and in November, during root-harvest, when the profitableness of the contract taken by the men in the fields is made to depend a good deal on the activity of the boys with the carts, and of the men at the heaps, who pit the roots and thatch them, all of whom are working at day-wages.

The following are the prices we have paid for the above descriptions of work during the past year. The wages which the men actually made are placed opposite; and we must remark, that before any one can pronounce these wages to be too high, (we are willing to admit the price given was too high in one of the cases,) he must know what sort of men they were who earned them. 2s. 6d. seems a great price for a day's work of an Agricultural labourer, but it was earned by filling 40 cubic yards of manure into carts, which all men could not do:—

	Wages earned per day of 10 hours. Men.	Wom.	Boys.
	s. d.	s. d.	
For turning dung and earth compost, 1st time, ¾d. to 1d. per yard; for do. 2d and 3d time, ½d. per yd.	2 0		
For filling well-made dung into carts, 7s. 6d. per 120 yards . . .	2 6		
For hoeing Wheat, 2s. 6d. to 3s. per acre; for twice hoeing Turnips (singling them, &c.), 5s. to 7s. an acre	—	0 10	6d to 10d
For harvesting Wheat (cutting, tying, and stooking), 7s. to 8s. 6d. an acre	2 6—3s.	—	1s to 1s 6d
For pitching and building Corn on the carts in the field, and pitching to the builder on the rick, 1s. 4d. per acre	2 6		
For harvesting roots (pulling, cutting off tops, and filling them into carts)			
Turnips, per acre, 6s. . . .	2 0	0 10	6d to 10d
Swedish Turnips, 8s. . . .	2 2	0 10	6d to 10d
Mangold Wurtzel, 9s. to 10s.	2 6	0 10	6d to 10d
Carrots, 21s.	2 0	0 10	6d to 10d

The price paid for harvesting the Mangold Wurtzel, as proved by the wages earned by the men during a short November's day, is, we think, the only case in which too large a sum was given; though in the absence of knowledge of what sort of workmen the labourers were, those who have been accustomed to paying for work by the piece will be more likely to agree with us in saying so than those who have been hitherto accustomed to pay only day-wages.

There is one advantage in this system of payment for work, viz.—the independent feeling which it imparts to the labourer; he is then no longer *bound* to a master, unless his own agreement be considered in that light; and at the same time his master has, within the limits of that agreement, all the hold upon him which he would have under any other mode of payment.

The above prices are not stated as giving in our judgment the wages which farm-servants ought to earn; these necessarily vary with the capability of the men and the customs of the country. In discussing practical subjects of this kind, we are careful to avoid assuming a dictatorial style, for we are well aware, in the practice of the farmer, how principles which might seem of almost universal applicability are nevertheless entirely at the mercy of the varying circumstances of different districts. We have merely stated our experience in this matter, in the hope that our practical readers will enable us to publish theirs.

We had written thus far, when our attention was directed to a paragraph on this subject in Mr. Pusey's article "On the Agricultural Improvements of Lincolnshire," in the current Number of the English Agricultural Society's Journal. It is from the pen of a Lincolnshire Agriculturist, and we quote it entire, as it entirely agrees with our own views of the subject. It will be perceived that the price given for loading manure is greater than that mentioned in the above table. Before, however, any inference can be drawn from this, we must know what sort of stuff the manure was, for it varies much in weight:—

"Whether 'task' work be more in practice in Lincolnshire than elsewhere, I, from my retired habits, know not; but it is a practice highly beneficial, both to the farmer and labourer; the one gets infinitely more work done, and the other more wages and better habits. For instance, in filling the carts with manure by the day, the labourer seldom fills more than eight or nine loads; whereas, for days together, this year, I had 160 loads of manure, each load 1¾ cubic yards, filled by 10 labourers at 1¾d. per load, and spread upon the fallows with nine carts, nine horses, and nine of my own men, and generally finished by 2, never later than 3, P.M.—sharp work, of course, but the labourers push everything else on—no creeping; and they thus earn 2s. 4d. a day, and have ample time to do a little work in their own gardens in the evening."

ON THE AGRICULTURAL VALUE OF LAND.

(*Continued from p. 42.*)

ALTHOUGH it thus appears that few means of improving the texture of a soil are so efficient as drainage, yet there are cases where the faults in its mechanical properties are of a kind that drainage will not remedy. If a clayey soil have the water removed from it, by which every winter it was worked to a paste, and, therefore, every summer dried to a brick, it will undoubtedly be greatly improved—it will be made more friable: the land, however, will still be clayey. If, again, sandy land be wet, drainage, although it will improve the soil, will not make it heavier, its lightness will still be its fault. The only way to remedy this is, in the one case, to add lime, ashes, and other substances tending to make the land looser; and, in the other, to add clay, marl, and other substances whose tendency is to make the soil heavier.

It is found in nature, and is the case in practice, that the more compound a soil is, the more valuable it is; that the fertility of a soil is, in a degree, dependent on the variety of its component parts. This may be because the merely *mechanical* properties of a soil, which consist of a

mixture of many earths, are more perfect than those possessed by a mixture of only one or two. But however it is explained, it is a fact which is borne out both by the observations of the geologist and the experience of the farmer. When the soil overlying the junction of two rocks, whose mineral composition is different, appears to be owing to a mixture of the parts of each, it is always found to be more fertile than the soil on either side of it, the one possessing the mineral composition merely of the one, and the other the mineral composition merely of the other. This mixture of soils frequently takes place, especially when the strata of the two adjacent rocks are horizontal, and the one thins out over the other. A very marked instance of increased fertility produced in this way occurs near Frampton-on Severn, Gloucestershire, where the gravel thins out over the clay of the lias. The land on the former of these beds is valued at 25*s.* per acre; that on the latter, which is of a perfectly opposite character, is valued at 20*s.* per acre. There is a band about 80 yards wide between the two, where the gravel thins out over the clay, in which the soil is valued at 35*s.* per acre. These valuations were made by a committee of the farmers of the parish, for the purpose of apportioning a new rate; and the differences in them are evidently owing to a mixture, in the narrow band alluded to, of the clay on its one side with the gravel on the other.

But the advantage of such a mixture is not only attested by the geologist who observes in nature cases in which it is apparent, but it is recognised by the practice of the farmer.

In the fen countries, the soil on the peat is altered and improved by spreading over it the clay on which it lies. When this has been done twice or thrice the value of the soil is greatly increased; instead of being so light as formerly that it was blown about by the wind, it has acquired a firmness fitting it for the growth of Wheat and Beans. This means of improving peaty soils might probably be made use of more generally than it is, for the very formation of peat requires that its subsoil be clayey, or at least that it possess the retentiveness of clay; and the chief fault of peaty soils being lightness, the remedy is thus always at hand.

Another instance occurs of an artificial mixture of soils, and the advantage attending it is attested by the practice of the Norfolk and Suffolk farmer. It is a common practice there to remove the defects of the light sandy soil of the lower member of the plastic clay, by digging pits in the corners of the fields, and fetching thence the clay, and sometimes the chalk marl which occurs at a considerable depth, and spreading it over the surface, at the rate of 100 cubic yards per acre. This, though it is effected at a cost of 6*d.* a cubic yard, is productive of a most profitable result. The land, as in the case of the peat, acquires a valuable degree of tenacity. In Staffordshire, also, and over the whole extent of the diluvium on the new red sandstone formation, it is a practice to dig the red marl which lies at no great depth, and spread it over the soil, which is a stiff gravelly clay. The difference here between the substances thus mingled is not so great as in the other cases, but is sufficient to render the operation profitable. There are many other cases in which an advantageous admixture of soils might be effected, and in which the subsoil-plough, which has the effect of gradually mixing the soil with the subsoil, might be used with advantage. In natural cases of mixture, such as those already alluded to, where a rock of one description thins out over one of another kind, a more thorough mixture of the ingredients of each might be effected by this implement to the depth of at least 16 inches. In those cases, again, where the subsoil is composed of beds of different material alternating with one another, a mixture of these could be effected to a similar depth in a similar manner. Thus, one of the members of the old red sandstone series consists in some places of alternating beds of clay and sand; and the soil is sandy or clayey, according as it is above the one or the other. It is full of water, which accumulates in the sandy strata and gets its way to the surface by rising over the edges of the beds of clay. In this case the improvement consequent on the use of the subsoil-plough after drainage would be immense; the surplus water would not only be taken away, but the soil itself would be altered, the sandy and clayey strata would be mingled.

The fertility of an alluvial soil which is formed at the mouths of large rivers by the subsidence of the earthy and vegetable matter carried down by them, is owing not only to the fineness of the particles of which it is composed, but also to the circumstance that it is composed of particles of a variety of rocks—of all those, in fact, through which the bed of the river passes, and is therefore generally a mixture of every variety of earth.

The mineral composition of a soil influences its value also, inasmuch as on it depends, in a great measure, the expense of working it. This, of course, is the case only on arable lands, but there, the labour on a clay soil is necessarily greater than the labour on a light sandy soil. And it is evident that though in both cases the amount of gross produce were the same, yet on subtracting the expense of labour, the value of the free produce would be less in one case than in the other.—*M. S.*

(To be continued.)

MANX AGRICULTURE.—No. II.

CONSIDERING the size of this island, the soil varies more than might be expected. The soil of the northern extremity is strong and deep, well adapted for Wheat and Beans, and valuable crops of the former are in favourable seasons generally obtained. In this portion, also, a large extent of deep alluvial soil occurs, and excellent marl may be obtained, but the latter is not so much used as it would be under equally favourable circumstances by British farmers. In practice it is not found to act so beneficially as elsewhere, if used on the land under which it is found; and not only is it too heavy to bear the expense of land-carriage to distant farms of lighter soil, but the nature of the tenures would for the most part render it illegal to remove it. The soil in the south is very different but hardly less valuable; and as the owners generally farm their own land, every advantage is gained which careful farming, adequate capital, and modern improvements can bestow. In the south are the only lime quarries which exist in the island, and from these kilns excellent lime is procured at a cheap rate—a two-horse cart-load for about 5*s.* The southern shores are also most prolific in casting up "wrack" or sea-weed, which is drawn away with great avidity and industry. This is generally put upon the Wheat and Oat stubbles during autumn and winter, ploughed in while yet fresh, and without any additional manure the Potatoes are planted in spring. The Potato crops thus managed, are generally good, averaging 30 and often reaching nearly 40 bolls (each boll being 4 cwt.) per acre. The sea-weed is not considered permanent manure, and can seldom be relied upon for more than one crop; it is not, however, an uncommon circumstance for a large farmer in the south to wrack the whole of his Potato land, and be thus enabled to bestow the farm-yard manure upon his Turnip crop. As before stated, the usual rotation of crops adopted is that under the four-course system, breaking up the Grass or Clover leaf or Oats, these being followed by Potatoes, and the Potato land being subsequently limed (by some, when the Potatoes appear in rows above ground, by others after the crop has been removed) for the succeeding Crop of Wheat or Barley, according to the quality of soil, or the speculative spirit of the farmer.

The species of Potato generally planted for the main crop is that called "Cups." It is a prolific and hardy variety, and bears a good character in the Liverpool and Manchester markets. Upon inland farms the most of the yard manure is bestowed upon the Potato crop, so that their Turnips are generally raised upon bone-dust, with or without vegetable ashes. During the last two years large quantities of guano have been imported from Liverpool, and this useful manure, when prudently applied, has been found admirably adapted to the Manx soils. How far it may be trusted for the succeeding crops of grain and Grass seeds is yet, perhaps, hardly ascertained; but there can be little fear of their succeeding if at least one-half of the Turnip crop is consumed on the land. The Barley is generally sown in spring with Grass seeds; Winter Barley is a variety little known or used in this island, although I have no doubt it would succeed, favoured as it would be by our mild seasons. Amongst other fiscal privileges with which the island is endowed, it is most happily free from those oppressive excise laws, which, especially as regards the malt duty, cramp the energies and lessen the profits of the British farmer. Every brewer is, and any farmer may be, his own maltster; and the home market for Barley (although greatly depressed by the recent tariff) is generally steady and fairly remunerative. In the management of the Hay crop the Manx farmer is culpably deficient. The Grass is generally allowed to shed its seed before it is mown, and if not exactly over-made, it is at all events allowed to remain in cock until, by the alternate influence of sun and rain, the nutritious properties have been for the most part wasted away. The lea generally continues two years, being mown one year and grazed the other, when it is broken up to receive the Oat-crop, which recommences the course.

As part of the course of cropping it may be proper to mention (now that increased attention is being invited to the subject in England) that it is generally the custom of the native Manx farmer to raise a small annual crop of Flax, but for domestic purposes only. The value of the seed for cattle feeding, and of the steeping fluid as liquid manure is little known, and perhaps never made use of, indeed the Flax is generally pulled before the seed-pod is ripe. At a former period much attention was paid to this crop, and previous to the decline of the Irish linen trade it was considered remunerative. The deep peaty soils of the "Carragh" land are admirably adapted to its successful cultivation, and if the value of the fibre is in some degree deteriorated by the ripening of the seed-pod, yet that loss would, it is believed, be amply counter-balanced by the value of the boiled seed for cattle-feeding, or of the raw seed for the next sowing.

In continuing this sketch of the Agriculture of the Isle of Man, it will remain to give some account of the live stock bred or imported into the island, of the implements of Agriculture—the average rents of land—the forms of leases—and of prices and quotations of markets, and to notice some peculiarities of tenure which exist.

It will, moreover, be only fair towards the English reader, and in no way unjust towards Manx Institutions, which are not conceived in the spirit of modern English legislation, and indeed are lamentably destitute of the principles of civilization (excepting those of the Gothic age), to impart some information respecting insular laws, customs, and privileges, which exist only for the benefit of the natives, and are oftentimes used as cruel engines of oppression and inhospitality towards the stranger who may settle amongst them.—*Cultor.*

ON MINERAL & INORGANIC MANURES.—No. IV.

BY PROFESSOR CHARLES SPRENGEL.

(Translated from the German.)

As lime possesses all the above qualities only in its caustic state, it follows, that, in order that the manuring with lime may produce the greatest effect, it should be placed as speedily as possible under ground, and mixed with the furrow-slice; for when it has again supplied itself with carbonic acid from the air, and has thus become mild, many of its qualities are either entirely lost or very much impaired, especially its action upon the coal of humus and the vegetable matter of the soil. Caustic lime will not suddenly loose its properties; several days, or weeks, will elapse, before it will have become entirely saturated with carbonic acid, for it has first to lose the water which it has absorbed. It is to be observed, however, that perfectly caustic lime, being easily soluble in water, may injure the crops, especially if large quantities are used. It must, therefore, be made a general rule, that a soil which has been manured with a large quantity of lime is not to be sown immediately afterwards with any crop, unless it contains much humic acid in a free state, for this will immediately combine with the lime and form a mild compound.

All crops grown after lime manure, will ripen the sooner for it, and this, in cold climates, is of some importance. To this is to be added, that such crops are not only more relished by cattle, but that they are really more nutritious; the former will be especially seen in the case of the very ferruginous soils, plants grown on them being unpalatable to the cattle, on account of the iron contained in them, and they become more nutritious and more savoury after the application of lime, because the superabundance of vegetable acid is then neutralised.

To moors or peaty soils, caustic as well as mild lime may be of use by neutralising the malic acid, and if the soil should be barren on account of sulphate of iron or sulphate of alumina, which are easily soluble in water, the application of lime will correct it most essentially, by decomposing those most deleterious salts and combining with their sulphuric acid into gypsum.

It has been also asserted that a plentiful application of lime will be useful to crops by its continually giving up to the roots of plants that carbonic acid which it absorbs from the air, thereby constantly supplying them with carbon. This assertion, however, not being based on any experiment whatever, does not deserve much credit; because even conceding that lime will give up to the roots the carbonic acid which it absorbs, this could (as we have seen before), only be done by their yielding to the lime another acid, which might contain as much, and perhaps more, carbon, than the carbonic acid. The chief use of lime is that it decomposes vegetable matter and the coal of humus, and that it combines afterwards with the humic acid, and thus, in the shape of humate of lime, which is soluble in 2,000 parts of water, yields to the plants a nourishment, which is probably useful, as this salt contains only 13 parts of lime and 87 parts of humic acid.

However useful the manuring with lime may be in most cases, we must guard against an over-use of it; because as lime prompts the humus to a speedier decomposition, a substance, which is to be preserved as much as possible, and which in fact, ought never to be entirely destroyed on account of its hydroscopic and other good properties; it is evident that the over use of lime will at length render a soil quite barren. It is, therefore, to be made a general rule that the oftener lime is employed, the oftener dung also is to be brought on the field, the only substitute perhaps for this being vegetable mould, and this in large quantities; by this, certainly the humus, though not the other substances which are contained in the dung, might be in some way replaced. Care must also be taken that no more vegetable nourishment be elicited by the lime from the humus than the crop can consume; because the soil contain much above the quantity thus required it is always to be feared that much humus will be lost by extracting powers of the rain-water. Lime and dung, however, ought never to be applied during the same year, because the lime easily takes hold of the humic acid in farm-yard manure is combined with ammonia, especially if the soil contain but little humus. Lime will take up the sulphuric and phosphoric acids already combined with ammonia, and thereby compel the latter to assume the form of gas, which will be the case the sooner, the drier the soil is. It is true that the nitrogenous substances of the dung will, perhaps, by the presence of lime, change into nitric acid, and thus into saltpetre; but still, it is always to be apprehended that ammonia which may be generated may be volatilized. If lime and dung are applied in the same year, the latter should be ploughed under with the fallow-furrow; the lime, on the other hand, with the seed-furrow, and only a small quantity is to be taken of the latter. It is generally believed that this is done for the sake of decomposing the dung too soon, but the more probable reason is that it may not drive off any ammonia; if lime and dung were mixed in the same furrow, ammonia would necessarily be volatilized.

It is also to be observed that lime be burnt for manure which contains 30 or more cent. of carbonate of magnesia (*Dolomite*), as it has found out in England land that such lime will injure tion. The reason of this assumption (although not fully borne out) is, that magnesia will, after burning, at the carbonic acid of the air, and in such proportion at the so-called three-quarter-carbonate of magnesia be formed; which salt, being soluble in 2500 parts water, would probably supply the plants with more magnesia than they need. It may be, also, that the bodies of the Dolomite are caused by burnt magnesia remaining a longer time in a state free from carbonic acid than burnt lime—so much so, that the humic acid soil will mostly unite with it; and then that the humate of magnesia (much more soluble in water than of lime) will supply the plants with too much sia. In soils rich in humus the bad effects of the ontaining too much magnesia

[illegible] to be apprehended (as is known from experi- [illegible] to this case proto-humate of magnesia will be [illegible], which does not convey so much magnesia to the [illegible] soils suffering less of it than the neutral salt. It is [illegible] the manuring with humic earth has produced [illegible] effect on soils which have been spoiled by [illegible]—which, if confirmed, is to be ascribed to the [illegible] proto-humate of magnesia.

We [illegible] always find that the manuring with lime will [illegible] useful on those soils which contain but little of it. [illegible] easily explained, as most cultivated plants require [illegible] for their nourishment. It is true, that a soil [illegible] the burnt lime is of much use may yet contain [illegible] in its natural state; but the latter will be found [illegible] a silicate, which is of no avail to plants, as it [illegible] neither in water, humic nor carbonic acids; or [illegible] in the state of a carbonate of lime, which [illegible] decomposes only in a very small degree the [illegible] or the vegetable matter of the soil; the [illegible] of lime, moreover, is not soluble in pure water, [illegible] such as contains much carbonic acid. In soils [illegible] which contain close under their surface, chalk or [illegible] the manuring with lime will be of little or no use at [illegible] easily accounted for by the deep-rooted plants [illegible] merely weeds) conveying a sufficient quan- [illegible] into the furrow-slice. It is asserted [illegible] the manuring with lime is injurious on fields which [illegible] towards the north. I confess that I cannot [illegible] Perhaps there are other causes which here [illegible] into play: still, it would be interesting if those who [illegible] this observation would bring their experience [illegible] subject before the public.

(To be continued.)

ON THE ECONOMY OF STALL FEEDING.

In a lecture on the fattening of cattle, delivered to the Royal Agricultural Society, and reported in the *Gardeners' Chronicle*, I stated that some experiments were then in progress at Woodfield Farm, through the kindness of Lord Ducie, which I believed would confirm some of the theories advanced in that lecture. I now beg to redeem my promise of communicating to the public the results of these experiments. They were carefully superintended by Mr. John Morton, from whom I have received much assistance on this and on many other occasions.

Liebig, in his work on Animal Chemistry, has defined more accurately than any preceding writer the source of animal heat, and the constituents of the food used in its support. He has shown that warmth is an equivalent for food, and that cold, on the other hand, renders necessary a greater supply of food, by carrying off rapidly the heat which its combustion engenders. He has also pointed out that motion is always accompanied by a waste of matter in the body, and it followed naturally from this that an economy of food was necessarily the result of an economy of action. The experiments of Lord Ducie and Mr. Childers, upon feeding sheep in sheds, afforded a powerful practical illustration of these theories. The warmth communicated by the sheds was equivalent to a certain amount of food, and the deprivation of motion occasioned a diminished waste of the tissues of the body, and, therefore, a corresponding saving of aliment. To illustrate these views more fully the following experiments were instituted on five lots of sheep, each lot consisting of five sheep:—

No. 1 lot was fed out of doors, and was therefore exposed to all the influence of atmospheric changes.

No. 2 lot was kept under an open shed, and therefore was less exposed to the inclemencies of the weather.

No. 3 lot was placed under an open shed, similar to the last lot, but in this case the sheep were kept solitary, *i.e.*, each was confined to a space of 3 ft. by 4 ft.

No. 4 lot was placed under a close shed in the *dark*.

No. 5 lot was kept under a shed like No. 4, except that each sheep was separated, and confined to a space of 3 ft. by 4 feet.

These different lots were allowed 1 pint of Oats for each sheep per diem, but were supplied with as many Swedes as they felt disposed to eat; the weights consumed were accurately determined. The live weights of the sheep were ascertained before the commencement, and at the conclusion of the experiments the results were as follows:—

	Live Weight, Nov. [illegible]	Live Weight, Mar. 9.	Increase in Live Weight.	Weight of roots eaten.	Increase in Live Weight for each 100 lbs. of roots eaten.
1	[illegible] lbs.	131½ lbs.	23½ lbs.	1912 lbs.	1·2 lbs.
2	104	132 2-5ths	28 2-5ths	1394	2·0
3	113	135 1-5th	22 1-5th	1238	1·8
4	102	129 4-5ths	27 4-5ths	886	3·1
5	[illegible]	13[illegible]2	20[illegible]	886	2·4

In the consideration of these experiments, we may refer to the "roots" alone, as the quantity of Corn supplied to the sheep was in all cases the same. It will be seen that the first lot, or that which was exposed to the cold, ate more than double the quantity of food consumed by the sheep fed in a dark warm shed. Exposure to cold winds abstracted heat so rapidly from the bodies of the sheep, that a large amount of food was necessary to support their proper temperature. That this excess of food was wholly employed for this purpose, and entirely lost as far as the farmer is concerned, is obvious, for the absolute increase in weight of the first and last lots is nearly equal, although the relative increase for the food consumed is much in favour of the latter. Thus, also, it will be seen, that although the second lot of sheep received 518 lbs of food less than the first, yet that lot reached a greater weight both absolutely and relatively. The second lot had the protection of a shed, and, therefore, did not require so much food to keep up the proper temperature of their bodies as the exposed sheep. In these two cases, both lots were similarly situated with regard to exercise. In lots 3 and 5, a diminished space was afforded, but without advantage, probably from disturbing the placid temperament of the animals, as they were observed to fret and lose their appetites when thus separated. The result attending the experiment with the 4th lot is highly interesting. The sheep forming this lot were confined in the dark. In this state there were no inducements for the sheep to move about, or even to remain in a waking state, except when impelled by hunger to eat food. Hence they passed much of their time in sleep. During sleep, the voluntary motions ceased, and there was small waste of the tissues of the animal, which now possessed almost entirely a vegetative life, and increased rapidly in size, with small consumption of food. Although eating considerably less than one-half of the food consumed by those sheep which were exposed to the weather and to the causes of waste produced by voluntary motion, this lot increased nearly as much in absolute weight at a relative economy of food nearly three times as great.

The results of these experiments are very favourable to the views brought forward in the lecture referred to. They will, I trust, confirm, if proof be still requisite, the economy of stall-feeding, and the principles on which this practice depends. I am quite aware that considerable evils have been found to attend the system in certain cases; but in every case which I have examined, the evils seem wholly attributable to the manner in which the system was carried into operation, and not to the system itself. Cattle are confined in sheds built without any regard to ventilation or cleanliness; they become diseased; and stall-feeding is pronounced by the farmer, who thus suffers the effects of his own want of care, to be very injurious, and to be productive of evil consequences to the health of his stock. If cattle are exposed continuously to an impure atmosphere, the tone of their system becomes depressed, and disease follows, sometimes exhibited in the form of diarrhœa, frequently of rot, very often of consumption, or of one or other of the many diseases to which cattle are liable. But none of them are the results of the system, nor have they occurred when due regard has been paid to cleanliness and ventilation. These are points which retard the progress of fattening much more than farmers are generally aware of. Attention to these circumstances would, I feel convinced, render more sure the favourable results which follow from the communication of warmth and the deprivation of excessive motion, and would be further productive of economy in the returns for food supplied.—*Lyon Playfair, Royal Institution, Manchester.*

ON THE APPLICATION OF CHEMISTRY TO AGRICULTURE UPON RATIONAL PRINCIPLES.—No. III.

(Continued from page 43.)

Thus we see how easily, with a little care and attention to experiments, a series of standards of the fertility of soils might be established. The same principle would apply equally to chalky or peaty soils. The amount of carbonate of lime indicating the former, and of vegetable matter the latter. But as the greater experience of others will not fail to suggest them, I refrain from mentioning standards by which the fertility of these soils may be easily fixed. The fertility of all soils is relative. One will produce a good crop of Corn, and a bad one of Turnips, and another *vice versâ*. This difference is almost entirely owing to the disproportion of impalpable matter and siliceous sand, and in many cases it is irremediable, except by a very considerable outlay of capital. Thus, in the heavy soil which I have mentioned above as containing 108 parts of impalpable matter to 187 of sand, to make it a workable soil it would be necessary to reduce the 108 by at least 10 per cent., and raise the proportion of sand as much.

How is this to be done? exclaims the intelligent owner of the soil. Where is the value of a science which describes to me a disease, but fails to suggest a remedy? In answer to these queries I would observe, that the first step towards the cure of a disease is to investigate its nature. If the disease is beyond remedy in its severe forms, it may be quite manageable in its milder stages. So it is with Chemistry as applied to Agriculture. Though it might be impossible in the above case to carry on to the land sufficient sand, to raise the elements of the soil to workable and fertilizing proportions, it would be by no means difficult to do so were the difference less, in districts where the material could be obtained. It is a well-known common practice to carry clay on to light lands where the impalpable matter which contains the aluminous earth is deficient. The utility also of carrying marl on to heavy soils is well known. Now marl, which is an impure carbonate of lime, can only be of use in two ways, either by rendering the texture of the soil looser—an important means of admitting moisture and air into the interior of the land—or it may be useful by absorbing moisture which contains ammonia, and thus indirectly contributing to the support and nourishment of the plant. A small amount only of the carbonate of lime (chalk or marl) is absorbed by the roots of the plants, and the experiments of chemists have proved that the carbon necessary for the support of plants is derived from the carbonic acid of the atmosphere, and not from inorganic matter in the soil.

On the contrary, silicate of potash or soda is essential to the growth of Corn and Grasses so that, when it is practicable, much greater benefit may be presumed to be derivable from mixing sand instead of chalk with heavy soils. Farmers will sometimes go a long way for chalk, when they could obtain sand much more easily. In Horticulture the use of sand is well known—why not attempt to carry out the principle upon which it is used upon a grand scale? I ought to mention that the whiter the sand the better, as the red sands sometimes contain more oxide of iron than would be useful; but this need not deter any one from trying the experiment, as clay soils are generally deficient in oxide of iron, a small portion of which is necessary to the growth of plants.

The importance, then, of obtaining, by correct analysis, the proportion of sand and impalpable matter is very apparent; and this knowledge may be obtained by very simple means. I will principally confine my observations on this part of the subject in detailing these means. Let Agriculturists only acquire the habit of scientific inquiry, and the more minute processes will become easy and familiar.

I proceed then to detail the method of distinguishing the following properties in all soils:—

Firstly—Their retention of moisture.

Secondly—The amount in a given quantity of soil, of coarse sand and undecomposed vegetable fibre.

Thirdly—The proportion of fine sand.

Fourthly—The proportion of impalpable matter.

The apparatus necessary for this analysis are:—

1st. A pair of small scales and weights.
2d. A spirit-lamp.
3d. A glass funnel and filtering paper.
4th. One or two Porcelain crucibles well baked.
5th. An iron stand and glass rod.
6th. A small pestle and mortar.
7th. A graduated half-pint glass measure.
8th. A phial of muriatic acid.

Any Chemist will supply these at a small cost. They might be fitted into a box and sold together. The operator must then proceed as follows:—A portion of the soil to be examined must be taken from a few inches beneath the surface, and exposed to the air in the sun until it becomes sensibly dry. Four hundred grains, or any convenient amount, must be now carefully weighed, and exposed to the heat of the spirit-lamp, a small piece of dry wood or chip being placed at the bottom of the vessel.

With his glass rod the operator must stir the soil about until the chip becomes charred, when the application of heat must be discontinued. The crucible being allowed to cool, the soil is now to be weighed and the loss of weight will indicate the amount of moisture. This is a very important characteristic of soils, as their fertilising properties are well known to be much influenced by their power of retaining moisture.—*C. R. Bree, Stowmarket.*

(To be continued.)

Home Correspondence.

Manure Dropped in the Field.—I take the liberty of submitting a few remarks on the national as well as individual advantage that might be derived from fully carrying out a method which I have practised for some years, and which I will call—an economical mode of applying that portion of manure upon a farm which is in a great measure annually lost for want of knowing how to make the most of it. I have read most English writers on the various ways of preparing and applying manures, but among them all I have not seen a single remark on the method which I have for some years put in practice, with much advantage to myself, and which I am quite sure would, if generally adopted, be of great benefit to every occupier of land. It is obvious to every one who knows anything at all of the matter, that in pasture land, where horses or other cattle are kept, the greater part of the dung voided by those animals is entirely lost, so far as the real improvement of the land, or the increase of such herbage as the cattle will eat, are concerned. In the heat of summer it is mostly dropped under trees, and near hedges or plantations, and in the places where the animals resort for shade; and in the latter end of autumn and in winter, in similar places, where they lie the greater part of the night for shelter. It is because of this that the Grass in such situations is very rank and unpalatable; in fact, it is scarcely ever eaten by either cow or horse, but gets trampled upon, so that much herbage is wasted. In meadows, the Grass in such places is generally so very rank, and so much earlier than in other parts of the field, that it gets lodged and spoilt before the rest of the field is ready to be mown. Much the same result will occur if the land be in tillage, as it causes the crops to grow too rank and to lodge, so as to be of little value; hence the richest land becomes of no real value to the occupier. To prevent such waste, I recommend the following simple method, which I know to be beneficial from long experience; it is not theory that I am advocating. In the spring of the year, when the cattle first go out to Grass, and their dung is thin, I generally carry a broad shovel with me when I fetch them in or take them out for milking, and all the dung which after lying down they drop in one heap, I spread out as wide as it will go, so that what covered one superficial foot I make to cover two or three. I thus manure double or treble the space that would be manured if the droppings were left as they fell from the animals; and instead of the herbage on those spots being lost for the season, or rendered so rank that nothing will eat it unless forced by scarcity, it will all along be increased in quantity over a larger surface, and will be beneficially consumed, the land being thus enabled to carry more stock through the season. When the dung is harder or crusted over, it can be spread out with the foot or, in case of slight frost towards the latter end of the year, it can easily be removed to a fresh place, where most wanted, to be there spread out as I have recommended. The dung of horses is of a different nature from that of cows, and sooner loses its fertilising properties; the heat of the sun soon evaporates its moisture, and insects extract its rich juices, so that in a few days it

becomes like dry chaff, almost useless as a manure. To prevent this, I tread or beat it hard down with a shovel, and if of a large size spread it out a little first; this consolidation prevents the flies from penetrating it for the juices, and hinders waste by evaporation. By this method an amount of benefit may be realised from the summer-made manure in the field, nearly equal to what is obtained from cattle fed in the house. After it has lain in that state some time, and after it has enriched the ground and herbage, the rooks generally come—often too soon—for the grubs and earth-worms, and scratch it about, so that without any manual labour we have the benefit of enriched herbage in a very short space of time. But, as I have before said, it often happens that the dung is voided where the herbage is already too luxuriant; in such cases it should be removed entirely to a bare and poorer spot, and spread and compressed as before described. I have observed that horses are more apt than other cattle to drop their dung on long grass and on moist places; wherever this is the case it should be removed to a drier and more barren spot before it does an injury. By constantly following such a practice as this, it is obvious that in the United Kingdom many thousand acres more than those now so treated might be annually enriched, on which, it is evident that much more stock could be kept, and as there would be more manure for the arable land, there would be a great increase of grain and root crops. By taking away the surplus manure from places where it wastes and does injury, those spots become of greater value to the occupier; the herbage would become sweeter for all kinds of stock, and there would only remain the middle of the fields to be manured from the farm-yard or compost-heap. When a field is too rich, as in some instances is the case, it would be advisable to collect the dung of cattle and appropriate it for other purposes, for it is manifest that so much herbage and grain as is annually wasted, from over-luxuriance, is a national as well as individual loss. If noblemen, gentlemen, and landed proprietors could but be induced to adopt in their parks and grounds the practice I have thus recommended, it would soon become generally known, and, if practised systematically by all who have the means, it would soon increase the vegetable productions of the country to a very considerable extent.—*W. Billington, Underhill, Oswestry, Salop.*

The Rooks.—At a meeting of proprietors, farmers, and others, called by advertisement in the Dumfries newspapers, to consider the most effectual means of putting a stop to the serious injury done to crops, &c. by the increasing number of Crows in this district of the country, various gentlemen stated the cost they were put to in protecting their crops from the ravages of the Crows, and the damage they sustain, notwithstanding all the care and cost they are able to bestow in preventing it. From these statements it appears that many farmers are at the present time paying, and find it necessary at other seasons of the year, particularly during the brairding of Wheat and Potatoes, to pay several persons for herding and keeping off the Crows, and that during several months in the year. That the damage actually sustained, over and above the expense of herding, by the ravages complained of, amounts to upwards of 1000*l.* annually. The meeting unanimously resolved—that while they did not pretend to say whether Crows may be productive of benefit, while kept within proper numbers, by destroying grubs and other insects, they were satisfied that a great excess of numbers at present exists, and that much serious loss and damage is the consequence. And that with a view to remedy this evil they respectfully but very earnestly entreat that those gentlemen who have rookeries upon their estates will either themselves cause the increase of the numbers in their rookeries to be prevented in time to come, by such methods as they may deem most expedient and effectual, or permit the committee named by this meeting to take the necessary measures at the proper seasons.—*Annandale.*

The Markets.—I inclose the return supplied by a widely-circulated provincial journal, in which you will see malting Barley quoted at from 35*s.* to 37*s.*, while in the *Agricultural Gazette* of Saturday last the highest quotation is 32*s.* for the same article. The best evidence, however, of the incorrectness of this report, is the fact that the average return of Barley for the week ending the 5th of January is given at 32*s.* 7*d.*, while the highest price quoted in the *Gazette* in its *Mark Lane* report of the 5th, is 32*s.*, with this observation annexed—"malting Barley continues in demand at Monday's quotations."—*D.* [In answer to our correspondent, we have only to say that the names of the parties furnishing market-reports are the only sureties we can possibly have for the accuracy of those reports; Messrs. Kingford and Lay are the parties who furnished the report which he has animadverted on, and we doubt not but they would sell on that day the various qualities of Barley at the prices they named.]

Berberry Blight.—I beg to thank "A Moorland Gardener" for his interesting account at p. 12 respecting the Berberry blight. His statement contains much both for and against the opinion that Berberry blights Corn. May I be allowed, however, to observe, that perhaps "A. M." was too young at the time he ate "a wamefu'" of Berberries, to notice that the bush he pu'd them from might be infected by two kinds of blight, one a rusty fungus, the other a light mealy one, similar to mildew seen on Hawthorn hedges. If the shrub in question has no evil influence on Corn, it is strange why the opinion should be so prevalent amongst farmers all over the country. Lately I had some conversation on the subject with J. Cully, Esq., who stands high as a Norfolk Agriculturist; he informed me that he once had a large Berberry bush in his garden, and when there happened to be Corn in the adjoining field it was always mildewed near the bush, but was not so after the bush was destroyed.—*J. Wighton.*

Means of Improving the Quality of Manure.—Upon extensive farms, which consist almost entirely of arable land, there is necessarily a large portion of the Straw that cannot receive much aid from the dung of animals. This is commonly denominated muck, and when applied to the soil proves but a weak manure; consequently, in carting it out, much labour is expended to produce small results. I am myself subject to this difficulty, and wish to devise means for improving the quality of that portion of my muck which cannot be used in the cattle-stalls or sheep-fold. I venture, therefore, to solicit the insertion of this letter in your *Agricultural Gazette* with a view to obtain answers from your correspondents to the following questions:—1st. Supposing the muck were formed into large manure-heaps, and during such formation one of the fertilisers now in use were added thereto—which of them would be most effectual in producing the desired result? 2dly. Whether such a mixture of muck and other matter would be a better application of the ingredients than if the muck were applied to the soil in the usual way by itself, and the fertiliser also by itself, drilled with the seed for the intended crop?—*R. C.* [Instead of answering this letter, as usual, among our "Notices to Correspondents," we insert it here, in order to elicit from our readers statements of *experiments* or *observation* on the important subject to which it refers.]

Experiments with Manures.—[I beg to notice that the lawn on which one experiment was made, has been under the scythe from 14 to 15 years; the soil is of a light sandy nature, over a layer 10 or 12 feet deep, of brown sand, which is superincumbent upon a bed of clay. It will be seen by our April experiment, that 3½ oz. guano, per yard, produced a greater weight of Grass than that which had 4 oz. per yard; this result rendered it desirable to ascertain whether 3½ oz. per yard was the maximum for land such as this trial was made on. Our committee, who have taken a warm interest in this matter, suggested that another trial should be made: the result is now before you; and though the season was far advanced (21st July and 4th August) and the lawn repeatedly mowed before the manure was applied, the effect of the guano and nitrate on the hungry soil was truly surprising, for during the sultry month of September, the portion done over with guano and nitrate formed a striking contrast in colour and luxuriance to the surrounding sward. This trial showed a gradual increase in the produce up to that which had 7 oz. of guano to the yard: but I found 7 oz. too strong a dressing; it has a tendency when first applied to scorch the sward, and the decrease in weight in the portion done over with 8 oz. results from the latter cause. I mixed the guano with more than double its weight of ashes, which were made from prunings and other refuse on the premises.] The subjoined particulars refer to an experiment which was made on one of the lawns in the Botanic Garden, Manchester, with Guano, Nitrate of Soda, and Granulated Compost, on the 27th April, 1843. The grass was mowed and weighed on the 29th June:—

	Rate per Acre. Produce. Grass. tons	cwts.	lbs.	oz.	Manure. Guano. cwts.	lbs.	oz.
The produce of 1 square yard, on which 1 oz. Guano mixed with ashes was spread, weighed 3 lbs.	6	9	72	0	2	78	8
The produce of 1 yard, on which 1½ oz. Guano mixed with ashes was spread, weighed 3 lbs. 2 oz.	6	15	5	0	4	5	12
The produce of 1 yard, on which 2 oz. Guano mixed with ashes was spread, weighed 3 lbs. 11½ oz.	8	0	78	12	5	45	0
The produce of 1 yard, on which 2½ oz. Guano mixed with ashes was spread, weighed 4 lbs. 4 oz.	9	3	74	0	6	84	4
The produce of 1 yard on which 3 oz. Guano mixed with ashes was spread, weighed 4 lbs. 11 oz.	10	2	63	8	8	11	8
The produce of 1 yard, on which 3½ oz. Guano mixed with ashes was spread, weighed 5 lbs. 14 oz.	12	13	99	0	9	50	12
The produce of 1 yard, on which 4 oz. Guano mixed with ashes was spread, weighed 4 lbs. 10 oz.	9	19	92	0	10	90	0
Hay.							
The produce of 21 square yards, on which 30½ oz. Guano mixed with ashes was spread, weighed 69 lbs. 1½ oz. The same, when dry or made hay, 24 lbs. 2 oz.	2	9	60	0	3	102	7
The produce of 21 yards, on which 7½ oz. Nitrate of Soda mixed with ashes was spread, weighed 56 lbs. 6½ oz. The same when made into hay, weighed 17 lbs. 1 oz.	1	15	15	0	0	107	13
Gran. Compost.							
The produce of 21 yards on which 42 oz. Granulated Compost was spread, weighed 42 lbs. 6 oz. The same, when made into hay, 15 lbs. 2½ oz.	1	11	10	0	5	43	12
The produce of 21 yards, without manure, 37 lbs. 14½ oz. The same, when dry, 13 lbs. 6 oz.	1	7	52	0			
Grass.					**Nitrate of Soda.**		
The produce of 4 yards, on which 1 oz. Nitrate of Soda mixed with ashes was spread, weighed 10 lbs. 4 oz.	5	10	82	8	0	75	10
The produce of 4 yards, on which 1½ oz. Nitrate of Soda was spread, weighed 11 lbs. 2 oz.	6	0	21	4	1	1	7
The produce of 4 yards, on which 2 oz. Nitrate of Soda mixed with ashes was spread, weighed 15 lbs.	8	2	6	0	1	39	4
Fall of rain in May, 3.10							
do. in June, 1.90							
5. inches.							

Result of a subsequent trial of Guano and Nitrate of Soda, which was made in the Botanic Garden, Manchester, on the 21st July, 1843. The crop was mowed on the 24th Oct., is dried, and now in separate lots for the inspection of gentlemen who may feel disposed to examine it:—

	Rate per Acre Hay. tons	cwts.	lbs.	oz.	Grass. cwts.	lbs.
The produce of 10 square yards, on which 3 oz. Guano per yard mixed with ashes was spread, weighed 9 lbs. 3 oz.	1	19	78	12		
The produce of 10 yards, on which 4 oz. Guano per yard was spread, weighed 10 lbs. 13 oz.	2	6	96	6		
The produce of 10 yards, on which 5 oz. Guano per yard was spread, weighed 11 lbs. 5 oz.	2	8	99	4		
The produce of 10 yards, on which 6 oz. Guano per yard was spread, weighed 11 lbs. 8 oz.	2	9	78	0		
The produce of 3 yards, on which 7 oz. Guano per yard was spread, weighed 3 lbs. 11½ oz.	2	13	62	10		
The produce of 3 yards, on which 8 oz. Guano per yard was spread, weighed 2 lbs. 11 oz.	2	13	5	11		
The produce of 10 yards, without manure, 4 lbs. 11 oz.	1	0	28	12		
The produce of 2 yards, on which 2 oz. Nitrate of Soda per yard was spread, weighed 2 lbs. ½ oz.	2		99	10		
The produce of 2 yards, on which 3 oz. per yard Nitrate of Soda was spread, weighed 2 lbs. 4½ oz.	2	9	32	10		
The produce of 2 yards, on which 4 oz. Nitrate per yard was spread, weighed 2 lbs. 5 oz.	2	9	103	4		
The produce of 2 yards, on which 5 oz. Nitrate of Soda per yard was spread, weighed 2 lbs. 6½ oz.	2	11	103	2		
The produce of 2 yards without manure, weighed 15 oz.	1	0	28	12		
The following trial was made on the 4th August with a new description of Guano, from the Cape of Good Hope, which was reported to contain 40 per cent. of animal matter; the Grass was cut on the 24th Oct.:—						
The produce of 2 yards, on which 1 oz. Cape Guano per yard was spread, weighed 1 lb. 2½ oz.	1	4	110	2		
The produce of 2 yards, on which 2 oz. Cape Guano per yard was spread, weighed 1 lb. 5½ oz.	1	9	3	14		
The produce of 2 yards, on which 3 oz. Cape Guano per yard was spread, weighed 1 lb. 8 oz.	1	12	45	0		
The produce of 2 yards, on which 4 oz. Cape Guano per yard was spread, weighed 1 lb. 12 oz.	1	17	91	0		
The produce of 2 yards, on which 5 oz. Cape Guano per yard was spread, weighed 1 lb. 14 oz.	2	0	57	8		
The produce of 2 yards without manure, 12 oz.	1	12	45	0

Salt.—Some time ago there was published "An Address to the Landed Interest on the Important Discovery of the Decomposition of Salt for the purposes of Manure, by Henry Kemp." In that address we are told that "The multiplied varieties of the culinary and flower garden have also borne witness to the general efficacy of prepared salt, and though I am aware that the superior culture usually bestowed on these departments hinders them from offering so unequivocal a test as fields that are worn and exhausted by Corn, yet the superior health and vigour of everything to which it was applied in the garden afforded the strongest evidence for concluding that the agency may be as universal as dung, or any other great assistant of vegetation." In another place it is said, "The Salt produces one-third more of Corn than the best dung, and its cost is only about 10*s.* per imperial acre," but how to decompose the Salt appears to be a secret. Has that secret been revealed yet? In those instructive articles in the 1st vol. of the *Chronicle*, named "Rural Chemistry," we are informed that Salt can be decomposed, how to convert it into a sulphate, and from that into a carbonate. Has Mr. Kemp any other method of decomposing Salt? Perhaps it may not be uninteresting to ask if the word Salt in the Bible has always a reference to common salt, the muriate of soda. We are informed that the term Salt was originally employed to denote common salt, but was afterwards generalized by chemists and employed by them in a very extensive and not very definite sense. To be understood by it any body that is sapid, easily made soluble in water, and not combustible, so that it represented a class of substances midway between earths and water. We are also told that the carbonate of soda is found in Syria and other places on the surface of the ground, and that it has often the appearance of a white dusty powder of a grey colour and alkaline taste. While reading the works of some of our Divines, there are two things we learn; the first is that they fancy themselves very good at explaining a text, however far the explanation be irreconcilable with the context; and the second is, that they endeavour to expound God's Word without knowing a very great deal about His works. When some of them speak about Salt or saltness, it appears to be synonymous with barrenness; and then we are referred to Pococke, Calmet, and Volney, as describing the land about the Dead Sea and other places, as barren from the quantity of salt it contains, and that no bird can fly across the Dead Sea or animal live in it, and that its shores are without vegetation. Some of these statements should be received with great caution. In an essay read before the Geographical Society of Berlin, January 6, 1839, by Prof. Robinson, of New York, it is said—"The Dead Sea lay before us in its vast deep chasm, shut in on both sides by precipitous mountains, and with its low projecting points and

...wards the south, resembling much a long wind... the estuary of a large river, when the tide is ... the sands left dry. We descended to the shore ... was more steep, rugged, and difficult, than is to be ...ing the Alps, and pitched our tent near the fine ...tain which bursts out upon a narrow terrace, ... ft. above the sea. The water of the fountain is ... transparent, but its temp. is 81° of Fahr. The ... descent below the fountain was apparently once ter... for gardens, and the ruins of a town are seen ... the right. The whole slope is still covered with ... and shrubs of a more southern clime; among ... we found the Osher, the fruit of which corresponds ... the ancient descriptions of the Apples of Sodom. ... needed but tillage to render this a most proli... the soil is rich, the heat great, and water abun... Of birds we saw many: indeed, at early dawn, ... and rocks and air were full of the carols of the ... the cheerful whistle of the quail, the call of the ... and the warbling of innumerable songsters; ... birds of prey were soaring and screaming in front ... cliffs above." We are informed by an authority ... we ought to credit above all others, that "Salt is ... " and it is only when it becomes like what chemists ... *caput mortuum*, that "It is neither fit for the ... nor for the dunghill, but men cast it out." But ... some of your correspondents could say whether ... "salt of the earth" literally means common salt or ...nate of soda.—*Peter Mackenzie.*

Quality of English-grown Larch and Scotch Pine Timber.—Some time ago I made some observations in the *Gardeners' Chronicle* upon the quality of Larch timber from the red and pale-blossomed varieties. Last spring an intelligent friend of mine, a worker of timber, at my request marked some trees of each variety, had them felled, worked them up, and found that the variety with red blossoms produced the red Larch timber, by far superior in every respect to the timber from the pale-blossomed variety. Now, as this is a fact, and one of very great importance, it would be advisable for all persons entrusted with the thinning of Larch plantations to notice the colour of the blossoms and to mark the trees, so that those producing the pale blossoms may be taken out and the others reserved for timber. June is the best time to fell resinous trees for durability, my friend—an observing experienced man in such matters—says, just when the sap begins to be fluid, before the first buds and leaves are expanded, as there is more of the resinous fluid afloat, or at least it is more regularly dispersed in the wood. Perhaps some of the intelligent readers of the *Gardeners' Chronicle* will say whether this is the fact. As to quality of the decried home-grown Scotch Fir, there is a beam in a house near my residence which is known to have been in it nearly, if not quite, 100 years, quite sound yet; which Fir was not grown on a high situation, where the timber of the Scotch Fir is considered to be the best, but from a rich plain some miles off, where the owner resides. Were the proper training of our home-grown Pine timber properly understood, there can be no doubt but it would be equal to any foreign. This important subject is not attended to at the present day as it ought to be; but when the popular rage for new manures and agricultural improvement has had its day, this neglected subject may, perhaps, be taken up as a novelty and have its day also. In the meantime, neither the great landed proprietors nor the Government seem to be fully aware of the evils of delay.—*W. Billington.*

Italian Rye Grass.—In answer to the inquiry of your Correspondent "A." as to whether I have ever harvested a crop of Wheat, which immediately succeeded Italian Rye grass upon heavy land, I am enabled to state that, on a heavy loam upon clay subsoil, for several years I have grown Italian Rye-grass with Red Clover for mowing, and that the crops of Wheat which immediately succeeded were invariably regular and good; much better, indeed, than the same land produced after summer fallow, before it was underdrained. It has frequently happened that in consequence of the failure of the seeds on small portions of the fields, on account of the heavy crops of the Barley sown with them, Italian Rye-grass was sown on such patches after harvest, and the Wheat was then sown there after Italian Rye-grass alone, and there has not been any perceptible difference in the crop of Wheat in those cases. Upon strong land, well under-drained, and in good condition, it is advisable to sow Beans, Peas, or Tares previous to Wheat upon lea pasture, and if such land be in high condition, clean and suitable for Oats, that crop might be taken after lea, and before Wheat; but in all cases it is advantageous to skim-plough the land on breaking up lea, and with such treatment and close drilling, though the subsequent crop may not require hoeing or much weeding, a full and productive crop of Wheat of good quality may be obtained from strong land after Italian Rye-grass.—*John Parkinson, Ley Fields, Newark, Notts.*

Reviews.

Second Report of the Chepstow Farmers' Club. A. Hall, Honorary Secretary.

We have here a pamphlet containing an expression of the opinions of practical men on farming subjects, which must always give works of this class a high character in the eyes of farmers, and extract records an instance in which the usefulness of science to the Agriculturist is apparent. The superiority of one sort of lime as manure over another, both of them being from quarries in the vicinity, was explained by an analysis of specimens undertaken at the instance of a neighbouring Farmers' Club. We extract the following notice of this matter:—

"On analyzing several specimens of limestone, all made use of in burning lime for manure, one was found to consist of nearly pure carbonate of lime, while the others had a quantity of magnesia in combination, varying from two-fifths to nearly one half the limestone. When it is taken into consideration that magnesian lime is generally acknowledged to be injurious to vegetation, at least in the quantity usually applied to land, the importance of some knowledge of the composition of soils, and the means of ascertaining the difference of substances often used indiscriminately as manure, must be admitted, particularly so when to the casual observer no difference may be apparent.

"Opinions have varied respecting the effects of magnesian lime when applied in moderate quantities, probably from the different kinds of soil on which it has been tried; but all the writers to whom your Committee have had the opportunity of referring, agree in stating that an overdose of this substance will cause a temporary sterility. Dr. Ure says,—'The lime resulting from the calcination of magnesian limestone appears to have an injurious effect on vegetation, unless applied in quantities considerably less than common lime, when it is found to fertilize the soil. After two years its hurtful influence seems to become exhausted, even when used in undue quantity. Great quantities of it are annually brought from Sunderland to Scotland by the Fifeshire farmers, and employed beneficially as a manure in preference to other kinds of lime. It has been unfairly denounced by Mr. Tennent and Sir H. Davy as a sterilizer.'

"Geological writers affirm, that the magnesian limestone is often found beneath a fertile soil, generally of a light description; and this may well be the case, even though a quantity of the finer particles of the stone be blended with the soil; because the magnesia, as a carbonate in the limestone, is in an inactive or harmless state, but when the carbonic acid is expelled by heat the magnesia becomes caustic, and, in quantity, is injurious to vegetation. It is probable that a larger proportion of magnesian lime may be advantageously applied to one soil than another; and the committee are rather of opinion, though without any precise data to come to a positive conclusion, that the greater the quantity of vegetable matter in the soil, the less likely will the application of magnesian lime be to prove injurious. The Committee are rather inclined to go farther, and favour the opinion, that on peaty soils the magnesian lime would be found more fertilizing as a manure than any other kind."

Brief Remarks on some Subjects connected with the Choice of Wheat for Seed; interesting to Farmers, Corn-factors and Bakers. By Sir G. S. Mackenzie, Bart., F.R.SS. L. & E. Maclachlan, Stewart, and Co., Edin., pp. 30.

We have only time at present very shortly to notice this work. It is on a most important subject, and we shall next week direct the particular attention of our readers to it.

The Author shows that most of the external characters, from an examination of which millers are accustomed to estimate the value of samples of Wheat submitted to them, are unworthy of confidence; that they are as likely to mislead, as to guide one to a correct judgment; and that, in fact, the dealings between farmers and Corn-factors have hitherto partaken very much of the character of guess-work. This assertion is founded upon a great many facts and chemical analyses, which are detailed at considerable length, but as we shall refer to these next week, we leave them at present, merely saying that much light is thrown by them upon a subject which has been hitherto neglected, although, as the title of this pamphlet truly tells us, it is one most important and "interesting to farmers, Corn-factors and bakers."

Miscellaneous.

Effects of soaking Seeds in Chemical Solutions.—I steeped the seeds of the various specimens exhibited, in sulphate, nitrate, and muriate of ammonia, in nitrate of soda and potass, and in combinations of these, and in all cases the results were highly favourable. For example, seeds of Wheat steeped in sulphate of ammonia on the 5th of July had by the 10th of August, the last day of the show, tillered into nine, ten, and eleven stems of nearly equal vigour; while seeds of the same sample, unprepared, and sown at the same time, in the same soil, had not tillered into more than two, three, and four stems. I prepared the various mixtures from the above specified salts exactly neutralised, and then added from eight to twelve measures of water. The time of steeping varied from 50 to 94 hours, at a temperature of about 60 deg. Fahrenheit. I found, however, that Barley does not succeed so well if steeped beyond 60 hours. Rye-Grass and other gramineous seeds do with steeping from 16 to 20 hours, and Clovers from 8 to 10, but not more; for, being bi-lobate, they are apt to swell too much and burst. The very superior specimens of tall Oats, averaging 160 grains on each stem, and eight available stems from each seed, were prepared from sulphate of ammonia. The specimens of Barley were prepared from nitrate of ammonia; they had an average of 10 available stems, and each stem an average of 34 grains in the ear. The other specimens of Oats which were next the most prolific, were from muriate of ammonia, and the promiscuous specimens of Oats were from nitrates of soda and potash—strong, numerous in stems, (some having not less than 52), and not so tall as either the preparations from the sulphate or muriate of ammonia. — *Mr. Campbell, Transactions of the Highland Society.*

On Fattening Cattle with Different Kinds of Food.—The cattle were bought at Falkirk, on the 12th of October, and on the 24th were lotted and put into separate yards, each of which had ample space and shelter from the weather, by covered sheds for the several lots which were distributed among them; and conceiving that the object which the Agricultural Society had in view in offering this premium was to find out a substitute for Turnips, each lot of cattle had a mixture of food allowed them, with the exception of lot No. 1, which was altogether fed upon Turnips and Straw, and may on that account be designated the trial lot; No. 2 had half the quantity or weight of Turnips which was allowed to No. 1, with 30 lbs. of linseed oil-cakes, as a substitute for the remainder of the Turnips; No. 3 had the same weight of Turnips which was given to No. 2, and had ground Corn in the place of the oil-cakes; the fourth lot got offal from a grain whisky distillery, and a portion of ground Beans, which was mixed into their draff every morning. By following out this arrangement we have ascertained the quantity of Turnips saved, the value of the Turnips in feeding by themselves, contrasted with the other substances, and their value as an auxiliary feeding when used with those richer substances, which, without some coarser food, will neither be an economical nor a beneficial food for cattle. All the lots had fresh straw given to them daily, which was not weighed, and below is a state of the food consumed and the expense incurred in the fattening of each lot:—

LOT NO. 1—FED ON TURNIPS.

		£	s.	d.
Oct. 12,	To price of five cattle	55	0	0
24,	— 10 days keep of ditto on Turnips and Straw, at 8*d.*	0	6	8
Jan. 1,	To 34 tons white globe Turnips, at 8*s.* 4*d.* per ton, since 24th October till this date, being 10 cwt. per day	14	3	4
April 7,	To 38 tons, 16 cwt. ruta baga, at 12*s.* 6*d.* per ton, since 1st January till this date, being 8 cwt. per day	24	5	0
		£93	15	0

At this date the Judges appointed by the Committee of Management, inspected the cattle, and reported their value to be 82*l.*

June 7,	To 21 tons, 9 cwt. ruta baga since 7th April till this date, at 12*s.* 6*d.*	13	8	2
		£107	3	2

The average expense of the keep of this lot is about 6*s.* 2*d.* per week each beast.

LOT NO. 2—FED ON TURNIPS AND OIL-CAKES.

		£	s.	d.
Oct. 12,	To price of five cattle	55	0	0
24,	— 10 days keep on Turnips and Straw, at 8*d.*	0	6	8
Jan. 1,	To 17 tons white globe Turnips, at 8*s.* 4*d.*	7	1	8
April 7,	To 19 tons 8 cwt. ruta baga, at 12*s.* 6*d.*	12	2	6
	— 1 ton 18 cwt. foreign linseed oil-cakes, at 7*l.* 15*s.* per ton, since 16th Nov. till this date, being 30lbs per day	14	14	6
		£89	5	4
	Estimated value at this date, 83*l.* 10*s.*			
June 7,	To 10 tons 14½ cwt. ruta baga, at 12*s.* 6*d.*	6	14	1
	— 16 cwt. 38 lbs. linseed cakes, at 8*l.*	6	10	8
		£102	10	1

The average expense of the keep of this lot is about 5*s.* 8*d.* per week each beast.

LOT NO. 3—FED ON TURNIPS AND GROUND CORN.

		£	s.	d.
Oct. 12,	To price of five cattle	55	0	0
24,	— 10 days keep on Turnips and Straw, at 8*d.*	0	6	8
	— 17 tons white globe Turnips, at 8*s.* 4*d.*	7	1	8
April 7,	To 19 tons 8 cwt. ruta baga, at 12*s.* 6*d.*	12	2	6
	— 1 ton 14 cwt. 98 lbs. of Bean meal, or 63 bushels ground Beans, weighing 62 lb. per bushel, at 5*s.*	15	15	0
	To 9 bushels bruised Oats, at 3*s.* 6*d.*	1	11	6
	Estimated value at this date, 77*l.*	£91	17	4
June 14,	To 10 tons 14½ cwt. ruta baga, at 12*s.* 6*d.*	6	14	1
	— 1 ton 9 cwt. 100 lbs. Bean meal, or 54 bushels ground Beans, weighing 62 lbs. per bushel at 5*s.*	13	10	0
		£112	1	5

The average expense of the keep of this lot is about 6*s.* 7*d.* per week each beast.

This lot had latterly the rough seed of Oatmeal, at 1½*d.* per bushel, as a mixture to the Bean meal, which are not charged, being worth the price as manure.

LOT NO. 4—FED ON DISTILLERY GRAINS AND GROUND BEANS.

		£	s.	d.
Oct. 12,	To price of five cattle	55	0	0
24,	— 10 days keep on Turnips and Straw, at 8*d.*	0	6	8
Nov. 7,	— 3 tons 5 cwt. white globe Turnips, at 8*s.* 4*d.*	1	7	1
April 7,	— 72 quarters draff, at 4*s.* 6*d.*	16	4	0
	— 60 puncheons dreg, at 2*s.* 6*d.*	7	10	0
	— 1 ton 14 cwt. 62 lb. Bean meal, or 62 bushels ground Beans, weighing 62 lbs. per bushel, at 5*s.*	15	10	0
	Estimated value at this date, 81*l.* 10*s.*	£95	17	9
June 14,	To 37½ quarters draff, at 4*s.* 6*d.*	8	8	9
	— 28 puncheons dreg, at 2*s.* 6*d.*	3	10	0
	— 19 cwt. 104 lbs. Bean meal, or 36 bushels ground Beans, weighing 62 lbs. per bushel, at 5*s.*	9	0	0
		£116	16	6

The average expense of the keep of this lot, is about 7*s.* 2*d.* per week each beast.

At the commencement of these experiments, No. 1, whose feeding was destined to be Turnips alone, that being the kind of food which they were formerly accustomed to, made a more immediate improvement than the cattle of the other lots. Upon the whole, it is evident by these experiments that feeding with Turnips *as an auxiliary*, has been the most advantageous mode of using them, for it is apparent that if the cattle of lot No. 1 had only been allowed half the quantity of Turnips which they consumed, and had got oil-cakes in lieu of the other half, as was given to lot No. 2, the expense of their keeping would have been lessened 4*l.* 13*s.*, and from superior quality their value would have been increased 10*l.*, making together 14*l.* 13*s.*; therefore, by bestowing the remainder of the Turnips, with the addition of oil-cakes, upon other five cattle, the realization upon the Turnips eaten by lot No. 1 would have been 29*l.* 6*s.* additional to what it has been. These experiments were carried on for two months after the valuation was made at the show in April; as from an over supply in the market, caused by a scarcity of Turnips, the cattle would not then have paid for their keep; but by

continuing till June I have been amply remunerated for all my outlay and trouble, without taking into account the great advantage of the additional and enriched manure of twenty cattle fattening upon the farm, where ten only could have been kept had Turnips alone been used for that purpose; and to any person at all acquainted with Agriculture it must be evident that one cart-load of manure made by cattle thus fed will be at least equal to two if the cattle had got only straw and water. The above experiments, which are corroborated by those conducted last season by Messrs. Andrew Howdon and Alexander Brodie, junior, tend to show that the winter feeding of cattle is more capable of successful extension by those who have a sufficiency of straw, but have not such an abundance of Turnips as to be able to make all their straw into manure by cattle upon full feeding, than was formerly imagined.—*Experiments by Mr. Brodie, of Abbey Mains, Haddington*, 1836-7.

Roots of Plants.—In loamy or sandy soils, the roots of trees have been found to penetrate to the depth of 10 or 12 feet; and the roots of the Canada Thistle have been traced 6 or 7 feet below the surface. Wheat, if planted in a mellow rich soil, will strike its roots 3 feet downwards, and elongate much further horizontally. The roots of Oats have been discovered at 18 inches from the stem, and the long thread-like roots of grass extend still further. The roots of an Onion are so white, that in black mould they can be readily traced, and in a trenched or spaded soil they have been followed to the depth of two feet. The Potato throws out roots to the distance of 15 or 20 inches; and the tap-rooted plants, Turnips, Beets, Carrots, &c., independent of perpendicular roots, spread their fibres to a distance which equals if it does not exceed the Potato. It is perfectly absurd to expect to succeed with roots of this class, unless the ground is so mellow as to allow them to penetrate and grow freely. —*Chatham Journal.*

Manuring and Steeping of Seeds.—The quantity of inorganic matter contained in the grain of Wheat, Oats, Barley, &c., is comparatively small. But, though small in quantity, this inorganic matter is absolutely essential to the perfect condition of the seed, and to the healthy growth of the plant that springs from it. When seeds are steeped in water, they swell and increase in bulk. They absorb a portion of the water and of any saline substances it may hold in solution. Now, if the small quantity of saline or inorganic matter which exists in seeds does really promote their growth, may not a larger quantity promote it more? May not the growth be more luxuriant if the seed be steeped in water containing saline substances in solution, and be thus made to absorb an additional proportion? It does not appear unreasonable to suppose that a bushel and a half of seed-Wheat may be made to absorb a pound of saline matter. This appears, indeed, to be only a very small quantity, and yet, if absorbed, it would add one half more to that which the seed naturally contains. We cannot pronounce beforehand, with absolute certainty, that by this absorption the growth of the seed would be greatly promoted, though both theory and practice concur in rendering it probable. Thus the experiments of Bickes—whose mode of preparing seeds appears to be a simple steeping in saline solutions—appear decisive in favour of the opinion, that such artificial additions to the saline matter of these do really, in some cases at least, greatly promote the growth of the seeds, and increase the luxuriance and produce of the after crops. Further, we know that some seeds germinate much more readily and certainly than others. We know, also, that the proportion of inorganic matter, or of ash they leave when burned, varies in different samples of seeds of the same kind. That contained by Wheat, for example, is sometimes 1¼, sometimes 1½, and sometimes nearly 2 per cent. of its weight. Can this difference in the growth of seed and the difference in the proportion of saline matter have any connection with each other? Do some germinate feebly, do others fail entirely, because they contain too small a proportion of the usual saline constituents of the seed? Would they germinate better if more were by some means given to the seed? The same experiments of Bickes, upon the effect of steeping, seem almost to answer these questions in the affirmative. —*Professor Johnston, in the Journal of Agriculture.*

Notices to Correspondents.

OUR CORRESPONDENTS will oblige us by not mixing together Agricultural and Horticultural questions, and by writing them on one side of the paper only. Such precautions can give them no trouble, and will save us a great deal.

COMMUNICATIONS from the following CORRESPONDENTS are in type, and are only waiting till room can be found for them:—*T. E., Martin Doyle, Patrick Clay, M. B. G.*, and *J. Rivers.*

BONES AND MURIATIC ACID.—*A Nottinghamshire Subscriber.*—Digest the bones in one half their weight of muriatic acid diluted with an equal weight of water. The application of heat to facilitate the action will not injure it as a manure.

BONES AND SULPHURIC ACID.—*A Subscriber's* request has been forwarded to Mr. Lawes.

BURTHENS ON ENGLISH FARMERS.—*An Inquirer.*—It is difficult to discuss such a subject as that you refer to in a manner free from such *party spirit* as must not be allowed in our columns. If, however, we can obtain a true and detailed statement in answer to your question, we shall publish it for you.

CUTTING TURNIPS FOR SHEEP.—*E. W.* will find information on this subject in p. 16, of the English Agricultural Society's Journal, vol. i. The extract is too long to insert. We believe that Gardiner's Turnip Cutter is as efficient an implement as any of its class.

DRILLS FOR SEED AND MANURE.—*Agricola.*—Your first letter must have miscarried. We have only received your second; and, in answer to it, we know of no better drill than those made by Mr. Hornsby, of Grantham, Lincolnshire, who manufactures them to sow all kinds of seed with manure. Nettles must be dug out and Thistles drawn. There is no way of destroying weeds but perseverance in destroying their leaves and digging out their roots.

EARLY POTATOES.—*J. M'L., Hillsborough.*—Shaw's Early, and Prince's Early, are two early varieties suitable for field culture. The Gold-finder is also a good sort.

GARDENERS' CHRONICLE AND AGRICULTURAL GAZETTE.—*Upsilon.*—Thanks for your letter. We do not differ much in our opinion on the subject of it.

GOLD OF PLEASURE.—*H. C. P.*—We have never cultivated this plant, but will gather up for you what we can about it from others.

GRASS SEEDS.—*J. R.*—In some seasons the Barley is a protection to the young Clovers and Grasses sown with it, and it is very rarely that the injury which in some cases may be done by it, is greater than the value of the crop fully compensates for. When the winter is not generally severe it is a good plan to feed young Clover off in autumn, but this practice is said to be injurious where it is succeeded by sharp frost.

HOW TO DESTROY MOSS IN GRASS-LAND.—*M.*—Manure the land well in autumn with a good coating of rich, well-made farmyard dung, and feed the Grass off with sheep. This is better than lime. You will see a reason given in "Sprengel on Inorganic Manures, No. III.," *Agricultural Gazette*, why you should mix lime with earth previously to applying it on land which is not very rich in vegetable matter.

JAMAICA AGRICULTURE.—*A Jamaica Planter.*—Will you allow us to look at these papers? We should not like to insert articles having no bearing upon *British* farming.

MANURES.—*J. B. H.*—It is dangerous to apply guano *immediately* to a crop. It is better to mix it with ashes or earth before it is spread over Grass. If, however, the labour of carting comes in your way, try sowing it broadcast, as you propose, during wet weather. We do not understand how, in the case of animals chewing the cud, Beans could pass through them whole, especially when they had been previously soaked.—*Trefoil.*—Nothing beats good farmyard dung. Guano is next best, applied at the rate of 3 cwt. per acre. Mix it well with soil before applying it.

MANURING GRASS LAND.—*Medicus Ashburtoniensis.*—You had better mix the contents of the pits you allude to with fresh mould, in order to give the matter a form in which you can apply it to your land. It may be applied after the rate of 20 or 30 bushels an acre. The Guano must either be mixed in the same way before spreading over your grass land, or it must be applied during wet weather; 2 cwt. an acre is a sufficient quantity.

RINGING PIGS.—*F.*—Your question, and all others having reference to veterinary art, will be answered shortly.

SALT AND LIME.—*A Subscriber.*—Mix 1, or at most 2 cwt., of salt with the quantity of lime you intend to put on an acre, and spread the Lime in the usual way. (See "Johnson on Fertilisers.") We do not know personally of any case in which it has been tried, although there are many published testimonies to its value as manure.

SAWDUST AS MANURE.—*E. B.*—It must either be mixed with farmyard manure, and so used as a compost, or, what would be better where it is produced in such large quantities, it must be burnt, and its ashes used as manure. It would do very well as manure if soaked with urine from the tank.

SEED-FEEDING SHEEP.—*A Subscriber.*—We have at this moment 200 sheep which have been treated, as described in our Leader No. 2, *Agricultural Gazette*, since October last, whose feet have been, and are now perfectly sound. We have others which have become lame since they were brought under shelter, but probably this is owing to a previous tendency to foot-rot. It is a bad plan to tie the sheep up all together, and the manure should be removed from under them periodically—say once a fortnight.

SOILS.—*J. Marshall.*—If you are not desirous of an *immediate* answer, we shall endeavour to give you one, perhaps by next *Gazette*; but if you are, you must put the matter in the hands of a Chemist, who will analyse the specimens for you.

STEPHENS' BOOK OF THE FARM.—*A Subscriber.*—The prolixity of certain periodical works, this among the number, is certainly blameworthy. You will see our opinion of it in No. 3, *Agricultural Gazette.*

SWEDES FOR SEED.—*C. W. W.*—You had better break off the sprouts that are appearing now, for if you do not, even though the frost should spare them, they will come to blossom at an unseasonable time.

***** As usual many communications have been received too late for answering this week.**

Markets.

SMITHFIELD, MONDAY, Jan. 22.—Per stone of 8 lbs.

Best Scots, Herefords, &c.	3s 10	to 4s 2		Best Downs & Half-breds	4s 0	to 4s 4	
Best Short Horns	3 8		3 10	Best Long-wooled	3 8	4 0	
Second quality Beasts	3 2		3 6	Ewes and second quality	3 4	3 8	
Calves	4 4		5 4	Pigs	3 4	4 4	

NUMBERS.—Beasts, 2713; Sheep, 27,120; Calves, 72; Pigs, 290.

Although the numbers are to-day considerably less than last Monday, we cannot observe any improvement in the trade. The demand is very limited—partly accounted for by the large arrivals of packed meat to the dead markets: the weather being, on the whole, pretty favourable for it, and being sold at a cheaper rate, the butchers have bought more largely dead, and, consequently, less alive. There is no quotable difference in Beef. As Half-bred Sheep from Norfolk, and Downs from the Western Counties, are now more plentiful, these descriptions of stock are lower. The Longwools keep about the same as of late, the sale of them being much helped by the advance in skins. Good Calves are again dearer, some few superior have realised 5s. 6d. per 8lbs. Pigs are a heavy trade at the same prices as our last.

FRIDAY, JAN. 26.

The supply to-day is small, but fully adequate to the demand. There have been very large arrivals of dead meat from Scotland since Monday, which at this time of year has great effect on our market. Beef is fully 2d. per 8lbs. lower than on Monday. Mutton keeps about the same price. Good Veal is still dear. There is rather a larger supply of Calves, but many are of inferior quality; the best are still worth full 5s. 4d., and something very choice may be quoted at 5s. 6d. per 8lbs. Pork trade is rather more cheerful, making from 3s. 8d. to 4s. 8d.

NUMBERS.—Beasts, 880; Sheep, 6130; Calves, 148; Pigs, 240.

41, West Smithfield.

POTATOES, Jan. 22.

SOUTHWARK WATERSIDE.—Since our last Report there has been some considerable arrivals, both from Yorkshire and Scotland: and, notwithstanding the former part of the week set in cold and frosty, it was only of short duration, and again became mild and fine. The demand was languid at former quotations, yet, in consequence of the supply from other districts having been very limited, an advance on some of the best samples was asked, but the dealers had no inclination to purchase at the advanced prices. Therefore some of the quotations may be considered nominal, and especially 70s. for Devonshire and Cornwall Reds.

York Reds	60s	to 80s	Kent and Essex Whites	—	55s
Perth	—	65	— — Kidneys	—	65

KINGSFORD AND LAY.

WOOL.—BRITISH, FRIDAY, Jan. 26.

A good many sales have been effected in our English Wool Market during the past week at rather improved rates. Although our reports from the manufacturing districts inform us of a good trade being done, they state that the prices of manufactured articles have not advanced in equal proportion with that of the raw material.

		Pauma Combing.

Southdown	Wrs & Ewes	1 0	1 1				

JAMES PERRIN, Wool Broker.

MARK LANE, FRIDAY, JANUARY 26.—The arrivals of Wheat since Monday have been moderate, but the Trade on Wednesday and this morning has been dull, and part of the Kent stands are not cleared. Foreign meets a very limited inquiry, and holders continue firm in their demands; we have only a few small parcels floating cargoes, and Dantzig free on board, Polish Odessa generally held at 39s. to 40s., and Dantzig Ex ship 44s. to 46s. according to quality.—Fine Malting Barley fully supports the quotations of Monday last, but inferior qualities are rather cheaper.—In Beans and Peas we observe no alteration.—The supply of Oats is considerable, and the sale difficult at late prices.

KINGSFORD AND LAY.

COVENT GARDEN, JAN. 26.—In consequence of the continued fine weather the market has been well supplied during the week, but trade still remains dull. Pine Apples are getting scarcer; they are selling at nearly the same prices as last week. Hothouse Grapes are very scarce, but Portugals are sufficient for the demand. Among Apples we noticed the Golden Pippin and good specimens of Blenheim Orange. Samples of Beurré Rance and Easter Beurré Pears, in addition to those mentioned in a previous report, have been brought to the market during the week. A few Sangarine Oranges have made their appearance in the market. Lemons are plentiful, and Filberts are sufficient for the demand. Vegetables generally are abundant. Cabbages are good and plentiful. Brussels Sprouts and Greens are abundant, but Broccoli is rather scarce. Seakale and Rhubarb, of good quality, are sufficient to meet the demand. Parsley is offered at the same prices as last week. Asparagus continues scarce. Endive is plentiful, and Shallots are equal to the demand. Celery is rather inferior in quality. Cut Flowers chiefly consist of Erica gracilis and hyemalis, Bignonia venusta, Euphorbia jacquiniflora, Azalea indica alba and Smithii, Poinsettia pulcherrima, Pelargoniums, Primulas, Acacias, Camellias, Chrysanthemums, and Roses.

FRUITS.

Pine Apple, per lb., 4s to 7s
Grapes, hothouse, per lb., 8s to 7s
,, Portugal, per lb. 1s to 2s
Apples, dessert, p. bush. 4s to 10s

Endive, per score, 9d to 2s
Green Mint, 4d to 9d per bunch
Marjoram, green, p. doz. bun. 1s to 2s
Chervil, per punnet, 2d to 3d
Salsafy, per bundle, 1s to 1s 6d
Scorzonera, per bundle, 1s 6d

HOPS, FRIDAY, Jan. 26.

THE Hop Market is in a very healthy state, and buyers are offering full 5l per cwt. over last week's prices—but holders are expecting a much greater advance, consequently we have scarcely any in offer, at the following currency:—

Mid & East Kent Pocks.	8l 0s	to 10l 10s	Sussex Pockets	4l 0s	to 6l 6s
Choice ditto	11 0		Choice ditto	6 12	
Weald of Kent Pocks.	6 0	6 12	Farnham	9 0	
Choice ditto	7 0				

PATTENDEN & SMITH, Hop-Factors.

HAY.—CUMBERLAND HAY MARKET, Jan. 26.

Meadow Hay	3l 8s	to 3l 17s	Clover	4l 14s	to 5l
— inferior	2l 18s	to 3l 8s	— inferior	4l	to 4l 6s

Straw 1l 6s to 1l 8s

JOSHUA BAKER, Hay Salesman.

WHITECHAPEL, Jan. 26.

Hay	2l 10s	to 3l	Clover	4l 0s	to 4l 16s
— fine Upland,	3l 5s	to 3l 15s	— fine,	5l	to 5l 5s

Straw, 1l 4s to 1l 6s

Very dull sale of Hay at the above quotations. Supply of Clover short, but trade brisk.

Catalogues on application.

Agent for Whitney's Waterproof Composition and Humphrey's Compound. May's Select Pansy and Hollyhock Seed, in packets at 2s. 6d. and 5s. each.

WANTED, a large Quantity of YEW and PRIVET for Underwood in Plantations. Parties having the above to dispose of, are requested to state the height, age, and price per Thousand, delivered at Derby—Burton-upon-Trent, Bretty Gardens. Address, post-paid, to Mr. PATTERSON, Bretty Gardens, Ashby-de-la-Zouch, Derbyshire.

WARWICKSHIRE ASSOCIATION FOR THE PROTECTION OF AGRICULTURE.

AT a numerous MEETING, convened by Requisition, and held by adjournment (from the WARWICK ARMS HOTEL,) at the COUNTY HALL, WARWICK, on WEDNESDAY, JANUARY the 24th, 1844, the Right Hon. LORD BROOKE in the chair, the following Resolutions were unanimously carried:

1st.—Proposed by E. B. GRANVILLE, Esq., and seconded by C. N. NEWDEGATE, Esq., M.P.—"That it is the firm and decided conviction of this Meeting that a Repeal of the Corn Laws would be highly prejudicial, not only to British Agriculture, but to the nation at large, would impoliticly diminish the income of the Land-owners, unjustifiably annihilate the capital of the Tenant Farmers, cruelly reduce the wages of the labourers below the means of sustenance, and consequently impair, if not destroy, Home Consumption, that great source of demand for the labour and industry of the people in all their branches."

2d.—Proposed by the Rev. J. C. ROBERTS, and seconded by E. B. KING, Esq.—"That all efforts to effect a *violation of the protective principle*, under existing circumstances, not only as regards Agriculture, but our National Industry in general, ought to be vigorously opposed."

3rd.—Proposed by Sir J. MORDAUNT, Bart., M.P., and seconded by Mr. C. LUCY,—"That the doctrines of the Anti-Corn-Law League, tending to produce jealousy and evil feeling amongst the several classes of the community, and having ulterior mischievous objects in view, are dangerous to the prosperity and peace of the country, and ought to be exposed and resisted."

4th.—Proposed by Mr. CHAPMAN, and seconded by Mr. WALLINGTON,—"That the Committee of the Association be requested to correspond with other Societies, formed for a similar purpose, and to adopt such measures as to them shall seem expedient, in effectually exposing and vigorously arresting the progress of the pernicious principles and objects of the Anti-Corn-Law League."

5th.—Proposed by Mr. HOUGHTON, and seconded by Mr. LYTHALL,—"That the Warwickshire Association, having been mainly supported by the Farmers, it is recommended that all classes dependent on the productive industry of the country be invited to co-operate, and that in furtherance of this purpose, donations be received by the Secretaries from all persons disposed to forward the object of this Meeting."

6th.—Proposed by H. C. WISE, Esq., and seconded by Mr. HEMMING,—"That the foregoing Resolutions be printed, circulated, and advertised in such manner as the Committee may approve."

The noble Lord having left the chair, a vote of thanks to him was proposed by Sir JOHN MORDAUNT, Bart., M.P., seconded and carried by acclamation, for his Lordship's able and impartial conduct as President of the Meeting.

RENDLE'S TANK SYSTEM OF HEATING.

STEPHENSON AND CO., 61, Gracechurch-street, London, Inventors of the IMPROVED CONICAL and DOUBLE CYLINDRICAL BOILERS, having been much engaged in heating buildings upon the above system with Tanks of various materials, solicit the attention of scientific Horticulturists to an Iron Tank now fitting up on their premises, which offers most decided advantages over every other article hitherto employed for the same purpose. These tanks which are ornamental in appearance can be made from 10 to 100 feet long and of any width and depth, and can be connected or disconnected by any working Gardener without the slightest difficulty, thus affording the opportunity to persons in remote districts of employing this much approved method of heating without the assistance of Engineers. The Tanks can be applied to Boilers and Pipes already fixed, and from the present low price of Iron will be found cheaper than of any other material. MR. RENDLE, of Plymouth, has kindly undertaken to receive orders and furnish information to any persons in his neighbourhood, and prices for any size will be forwarded upon application to S. and Co.

J. WEEKS & Co., ARCHITECTS, HORTICULTURAL BUILDERS, and HOT-WATER APPARATUS MANUFACTURERS, Gloucester-place, King's-road, Chelsea.

BURBIDGE AND HEALY beg respectfully to inform the Horticultural world that they are quite ready to supply their new BOILER, of every size. They have now fixed a sufficient number to warrant them in stating that what they put forth as the qualities of their Boiler and Furnace arrangement may be perfectly relied upon: they have put up one at the Horticultural Gardens, where B. and H. believe it is considered to answer as represented; they have also fixed it in connection with a new description of Iron Tank, which combines the qualities of the round pipe and the open tank, which may be pronounced the perfection of a Heating Apparatus for Horticultural purposes, particularly for Graperies, Epiphyte-houses, Melon-pits, &c. &c. The arrangement is such that any gentleman or gardener may have the whole constructed so as to be put together with the greatest facility by the gardener, first sending a correct plan to 136, Fleet-street. A Prospectus may be had detailing the prices, &c.

GUANO ON SALE BY THE IMPORTERS,
JOHN BOYD & Co.,
Wellington Chambers, London Bridge, Borough.

CHEAP FUEL FOR HOTHOUSES AND STOVES.—Coke, the same as used by the Horticultural Society, to be had in large quantities, at very reduced prices, at the Phœnix Gas Works, Bankside, or Greenwich.

GENUINE PERUVIAN & BOLIVIAN GUANO
ON SALE, BY THE IMPORTERS,
ANTONY GIBBS AND SONS, LONDON;
GIBBS, BRIGHT, AND CO., LIVERPOOL AND BRISTOL.
47, Lime-st., Jan. 25, 1844.

ON SALE, in any quantity, PERUVIAN and BOLIVIAN GUANO, genuine as imported,—Apply to COTESWORTH, POWELL, and PRYOR, London; EDWARDS, DANSON, and Co., Liverpool; or WILLIAM J. MYERS and Co., Liverpool, the Importers.

POTTER'S GUANO.—Sir Robert Peel, the Earl of Zetland, and others, have used POTTER'S MANURE with the greatest success on almost every kind of crop and soil. Testimonials may be obtained by application, per post, at the Works, 28, Upper Fore-street, Lambeth, or of any of Mr. POTTER'S agents.—See also the Advertisement in this Paper of the 6th Jan., containing some of the Testimonials referred to.

GUANO, PERUVIAN, &c.—The above Manures, also Potter's Guano, Nitrates of Soda and Potash, Gypsum, Bone-dust, and all other Chemical Manures of known value may be had of the undersigned, on the best terms, for cash.

Lists of Prices, with synopsis of mode of use, on applications to MARK FOTHERGILL, 40, Upper Thames-street, London.

GUANO.—The Subscribers will bring in a cargo this MANURE to Berwick-upon-Tweed, in all February and March, direct from Valparaiso.

Haddington, Jan. 22, 1844. BANKS & SON.

Note.—As this will be one of the very few cargoes from the Pacific, whose charterparties will admit of their discharging on this coast, BANKS and SON would recommend intending purchasers to apply for what they may require as early as possible.

THE URATE of the LONDON MANURE COMPANY, 5l. per Ton. It is with the greatest satisfaction, after three years' experience, the Company are enabled to recommend the above as one of the best manures for Barley, Oats, Spring Wheat, and more especially Turnips. By promoting a rapid growth of the latter it secures a full plant, at the same time producing a great weight per acre, and extending its beneficial effects to the succeeding crops. The Urate may be sown broadcast, or which is preferable, by the drill, at the rate of one ton to three acres, and it is desirable it should not be placed more than two inches below the surface. As a top-dressing for Wheat the Urate has been used with great advantage. Gardeners and Florists will find it very useful for Dahlias and other roots. Full particulars and Testimonials will be forwarded on application. Genuine Peruvian Guano; Phosphate and Sulphate of Ammonia; Gypsum and every other artificial Manure.

EDWARD PURSER, Secretary, 40, New Bridge Street.

GLASS SUPERSEDED for HORTICULTURAL PURPOSES by WHITNEY'S CHEMICAL TRANSPARENT WATERPROOF COMPOSITION, rendering Muslin, Calico, or Linen, for the Frames of Greenhouses, Pine, Melon, or Cucumber Stoves, &c., impervious to rain or moisture, admitting light equal to Glass, much warmer, and the plants never burn under it.

Noblemen, Gentlemen, and Gardeners will, by using this composition have the only effectual protection for their Fruit-trees during the blooming season; it is a certain defence from frost, sleet, wind, and blight; its transparency admits the general beams of the sun, with abundance of light, which causes the bloom to expand with increased luxuriance, the fruit to set and swell more freely, much earlier, and a crop of fruit to any extent may be warranted. The covering not to be moved by day (except to thin the Fruit, which will be necessary), till the month of June. It is recommended that the Calico be prepared early, so as to be thoroughly dry before using.

Sold in Bottles, with directions for use, pints, 2s. 6d., quarts, 4s. 6d. each. One pint is sufficient to coat four Frames twice over, each Frame to be 5ft. by 3 ft. 3 in., or thereabouts. Prepared by GEORGE WHITNEY, Chemist, Shrewsbury. Seedsmen, Florists, and Merchants supplied by Mr. W. BAILEY, Chemist, North-street, Wolverhampton. Appointed Agents:—Messrs. BUTLER and MUCKLEY, Covent Garden, where a sample of prepared calico may be seen; Mr. WATKINSON, Market-place, Manchester; PAGE and SON, Southampton; T. and C. WHALLEY, Nurserymen, Liverpool.

Agents wanted for London and the country.

BY HER MAJESTY'S ROYAL LETTERS PATENT.

PATENT ASPHALTE ROOFING.

THE above Material has been used and approved by the Nobility, Gentry, and Agriculturists generally, as a Roofing and Covering to sides of Farm Buildings; its advantages are—Lightness, Durability, and Economy. Being a non-conductor, it has been proved an efficient "Protective Material" to Plants, and is now in use at the "Royal Horticultural Society's Gardens, Chiswick." It can be had of any length, 32 inches wide, at 1d. per foot, super. A discount to the trade.

THOS. J. CROGGON, 8, Ingram-court, Fenchurch-st., London.

DISEASED AND HEALTHY LIVES ASSURED.

MEDICAL, INVALID, and GENERAL LIFE OFFICE, 25, Pall Mall, London. Capital, 500,000l.—This Office is provided with very accurately-constructed Tables, by which it can Assure Diseased Lives on Equitable Terms. Increased Annuities granted on *unsound* Lives, the amount varying with the particular disease. Members of Consumptive Families Assured at Equitable Rates. Loans granted upon personal security.

E. G. P. NELSON, Actuary.

CLOSE OF HOLIDAYS.

NOW THAT THE SEASON of Annual Festivity is about to terminate, and the respective Boarding Schools be reinstated by the busy throng of useful aspirants, the personal comfort and attractions of whom become naturally an object with friends and relatives of great solicitude, ROWLAND'S MACASSAR OIL, for accelerating the growth, and for preserving and beautifying the hair; ROWLAND'S KALYDOR, for preserving the skin and complexion, and removing cutaneous eruptions; and ROWLAND'S ODONTO for beautifying the Teeth and preserving the Gums, are universally considered indispensable in the requisite accompaniments of the decorative Repository.

The August Patronage conceded by our Gracious Queen, and the several Sovereigns of Europe, together with the Beauties which adorn the circles of Princely and Regal Magnificence; and the confirmation by experience of the infallible efficacy *of these creature renovating Specifics*, have characterised them with perfection, and given them a celebrity unparalleled.

NOTICE.—It is necessary on purchasing either article to see that the word "ROWLANDS" is on the Wrapper. For the Protection of the Public from fraud and imposition, the Honourable Commissioners of Her Majesty's Stamps have authorised the Proprietors to have their names engraved on the Government Stamp, thus:—"A. ROWLAND and SON, 20, Hatton-garden," which is affixed to the Kalydor and Odonto. Be sure to ask for "ROWLAND'S" Articles.

Sold by the Proprietors and by all Chemists and Perfumers.

NEW FARMERS' NEWSPAPER.

THE time has come when Landlords and Tenants, large Farmers and small, must devote their anxious attention to improved cultivation—when, in the words of Sir Robert Peel, "All we have to *learn how, in the shortest time, and at the least expense, to produce the greatest quantity of food, vegetable or animal, without permanent injury to the land.*" To accomplish this, no means can be so effectual as that which brings the results of Experience and Science before every man, in a cheap form. For this purpose THE AGRICULTURAL GAZETTE has been established.

The Proprietors are aware of the difficulties of dealing with the many details of cultivation without an acquaintance with circumstances, often as varying as places. They condemn the idea of conducting farming operations upon one invariable plan; and, while they welcome science as the best auxiliary of practice, they regard crude speculations as the most dangerous of delusions. At the same time they also feel that in Agriculture, as in all other arts, there are general principles upon which successful farming must depend; that there are practical errors which no local circumstances can justify; in short, that there is room for improvement even in those branches which are best understood. No one man can be competent to deal with the multifarious questions affecting husbandry, and the duty of the Editor of such a Paper as THE AGRICULTURAL GAZETTE, is to make known the knowledge of all. It is to practical Farmers that the Proprietors trust for the means of carrying out their views, and not to the talents of any individual. While, therefore, they state that the Editor of THE AGRICULTURAL GAZETTE is a gentleman well acquainted with the best modes of Farming, in which he is actively engaged, they feel it to be of far more importance to announce the promise of assistance received from the landed and farming interest generally, especially of those whose names they are permitted to mention:—

The Right. Hon. the Earl Spencer, President of the Royal Agricultural Society of England.

The Right Hon. the Earl of Ducie, Vice-President of the Royal Agricultural Society of England
Sir Charles Lemon, Bart., M.P., F.R.S., one of the Council of the Royal Agricultural Society of England
J. H. Langston, Esq., M.P.

Mr. G. Hope, Fenton Rams, East Lothian
&c. &c. &c.

The Practice of Agriculture—its Science—Animal and Vegetable Physiology—Improvements in Implements—better modes of Husbandry—results of well-conducted experimental Farming—Growth and Rotation of Crops—Stock—Drainage—Irrigation—Foresting—Road-making—Farm-Buildings—Labourers—in short, whatever affects the beneficial employment of capital is in turn form topics of consideration. Reports are also given of the English, Scotch, and Irish Agricultural Societies—London Market Prices of Corn, Hay, and Cattle, and the Weekly Averages.

Replies to questions connected with the objects of the Paper are also furnished weekly.

Considering the union which exists between Horticulture and Agriculture, it has been thought advisable to make THE AGRICULTURAL GAZETTE an addition to the GARDENERS' CHRONICLE, edited by DR. LINDLEY, and so extensively known; but that there may be ample room for discussion, that Paper *has been increased one-half in size without additional charge*—thus Twenty-four Columns are occupied by Horticulture, Twenty-four by the General News of the Week, whilst **Twenty-four Columns are devoted to Agriculture.**

This day, therefore, January 27th, is published, price SIXPENCE, stamped to go free by post, the FOURTH NUMBER *of*

THE GARDENERS' CHRONICLE
AND
AGRICULTURAL GAZETTE:

A Weekly Record of Rural Economy and General News.

THE HORTICULTURAL PART EDITED BY PROFESSOR LINDLEY.

THE principle on which the Gardening part of this Paper is conducted is to make it a weekly record of everything that bears upon Horticulture, Floriculture, Arboriculture, or Botany, and such Natural History as has a relation to Gardening, with Notices and Criticisms of all works on such subjects. Connected with this part are WEEKLY CALENDARS of GARDENING OPERATIONS, given in detail, and adapted to the objects of persons in every station of life; so that the Cottager with a few rods of ground before his door, the Amateur who has a greenhouse, and the Manager of extensive gardens, are alike informed of the routine of operations which the varying seasons render necessary. It moreover contains reports of Horticultural Exhibitions and Proceedings—Notices of Novelties and Improvements—in short, everything that can tend to advance the profession, benefit the condition of the workman, or conduce to the pecuniary profit of his employer; accompanied with Woodcuts, whenever the matter treated of requires that mode of illustration.

To this Farming, as explained above, is now added.

Lastly, that description of domestic and political News is introduced which is usually found in a Weekly Newspaper. It is unnecessary to dwell on this head further than to say, that the Proprietors do not range themselves under the banners of any party; their earnest endeavours are to make THE GARDENERS' CHRONICLE a full and comprehensive *Record of Facts*—a NEWSPAPER in the true sense of the word—leaving the reader to form his own opinions; their object being elucidation of the laws of Nature, not of man. The reader is thus furnished, IN ADDITION TO THE PECULIAR FEATURES OF THE JOURNAL, with such information concerning the events of the day as supersedes the necessity of his providing himself with any other Weekly Paper.

The Proprietors are happy to announce that the following distinguished Botanists, Florists, and Practical Gardeners have already enriched the GARDENERS' CHRONICLE by their communications:

The Hon. and Very Rev. W. Herbert, Dean of Manchester
The Hon. and Rev. Charles Bathurst
Hon. W. Fox Strangways
Sir Oswald Mosley, Bart.
Sir W. J. Hooker, F.R.S., Royal Gardens, Kew
Dr. Harris
Dr. Horner, Hull
Dr. Lankester, F.L.S.
Dr. Neil, Canon Mills
Dr. Winn, Truro
Capt. Widdrington, F.R.S.
Professor Morren, Liege
A. Ainger, Esq.
G. Barker, Esq., Birmingham
E. Barnard, Esq., F.R.S.
C. Darwin, Esq.
John Rogers, Esq., Sevenoaks
Mr. Mc Nab, Caledonian Society's Garden, Edinburgh
Mr. Mearns, Botanic and Zoological Gardens, Leeds
Mr. Ingram, Gardener to Her Majesty
Mr. Paxton, Gardener to the Duke of Devonshire
Mr. Fleming, Gardener to the Duke of Sutherland
Mr. Alexander, Gardener to the Duke of Leinster

Order of any Newsvender or Bookseller.

BETTS'S PATENT BRANDY.—DISTILLERY, No. 7, SMITHFIELD BARS.—Notwithstanding the publicity for many years past given to the superiority of BETTS'S PATENT FRENCH DISTILLED BRANDY over every other Spirit, British or Foreign, it is yet but partially known: J. T. BETTS and Co. therefore feel it a duty they owe to the Public and themselves, to institute a comparison between the Patent and the French Brandy, that every Family in the kingdom, in which Brandy is consumed, may have made trial of their Patent Brandy,—and, consequently, discontinued the use of the Foreign article. Their respective merits are fairly developed in the following Testimonials, to which they again beg to refer:—

EXTRACTS FROM TESTIMONIALS.

"I do not hesitate to express my conviction that your Patent Brandy is fully as free from everything injurious to health, and contains as pure a spirit as the best varieties of Foreign Brandy. EDWARD TURNER, Professor of Chemistry in the University of London.

"I am bound to say, and do assert it with confidence, that, for purity of spirit, this cannot be surpassed; and that your Patent Brandy is also quite free from those acids which, though in small quantity, always contaminate the Foreign Spirit. JOHN HOME, Chemist to His Majesty. "J. T. Betts, Esq."

"Your Brandy is free from uncombined acid and astringent matter, which exists, more or less, in most of the Brandies imported from France. JOHN THOMAS COOPER, Lecturer on Chemistry.

"To Mr. Betts."

"It has perfect freedom from the above objectionable qualities, and its agreeable similarity in flavour to the finest samples of Cognac Brandy, that constitute the peculiar value of the Patent Brandy.

J. T. BETTS and Co. are, at length, enabled to give a distinct assurance that arrangements will be completed in the course of the present month, which will afford an unfailing protection to the public against the continuance of those frauds, from which they have hitherto so extensively suffered; as each bottle will be secured by a PATENT METALLIC CAPSULE, or covering for the cork of solid metal, with their name, address, and the words "Betts's Patent Brandy" embossed upon it; the forgery of which subjects the guilty party to a Penalty of Fifty Pounds for each offence.

This valuable Spirit is manufactured only at the Distillery, No. 7, Smithfield Bars, leading to St. John-street; where it may be obtained, either pale or coloured, in quantities not less than Five Gallons, at 15s. per Gallon, for Cash, on delivery.

SUPERIOR SUBSTITUTE FOR TARPAULIN, &c.

C. MACINTOSH & Co. having made a considerable reduction in the price of the Patent India Rubber Cloths for Carts, Waggons, Ricks, &c., beg to call the attention of Farmers to this article of Tarpaulin and Oiled Sheets, to the superiority of which for manufacture as an effectual protection against wet, not liable to crack on being folded, and more economical than any other Waterproof cover.—22, York-street, Manchester; and 46 Cheapside, London.

CUCUMBER and MELON BOXES and LIGHTS.—For Sale, one, two, and three-light BOXES and LIGHTS, of all sizes, ready for immediate use, warranted of the best materials, packed and sent to all parts of the Kingdom; two-light Boxes and Lights complete from 1*l.* 8*s.* Garden Lights made, painted, and glazed, from 1*s.* per foot. Sashes and Frames made and hung complete, 1*s* 8*d.* per foot.—At JAMES WATTS, Sash Manufactory, 8, Claremont-place, Old Kent-road.

*** Reference given.

NEWSPAPER OFFICE, 15, Coventry-street, Haymarket, London.—Established upwards of 30 years.

T. MUDIE and SONS, Agents for the supply of the GARDENERS' CHRONICLE AND AGRICULTURAL GAZETTE, forward that and all the other London Newspapers (a correct list of which may be had on application), with the strictest regularity to all parts of the Kingdom, and to the Colonies, free of postage; and by the Morning Mails if requisite. T. M. and Sons beg to state that they print the entire address of their Customers on the wrapper, when ordered for six months or longer.

METCALFE'S NEW PATTERN TOOTH-BRUSH and SMYRNA SPONGES.—The Tooth Brush has the important advantage of searching thoroughly into the divisions of the teeth, and cleaning them in the most effectual and extraordinary manner, and is famous for the hairs not coming loose—1*s.* An improved Clothes Brush, that cleans in a third part of the usual time, and incapable of injuring the finest nap. Penetrating Hair-brushes, with the durable unbleached Russian bristles, which do not soften like common hair. Flesh Brushes, of improved graduated and powerful friction. Velvet Brushes, which act in the most surprising and successful manner. The Genuine Smyrna Sponge, with its preserved valuable properties of absorption, vitality, and durability, by means of direct importations, dispensing with all intermediate parties' profits and destructive bleaching, and securing the luxury of a genuine Smyrna Sponge. Only at METCALFE'S Sole Establishment, 130B, Oxford-street, one door from Holles-street.

Caution—Beware of the words "From Metcalfe's," adopted by some houses.

EDWARD BECK invites the attention of Horticulturists to the different articles manufactured by him in SLATE. They may be seen in use at WORTON COTTAGE, ISLEWORTH, upon application to the Gardener—*Sundays excepted.*

BURBIDGE AND HEALY'S COOKING APPARATUS, combining Sylvester's Patents.—This Cooking Apparatus is believed to possess greater general advantages than any yet submitted to the Public, both as regards strength of material and workmanship; in fact, the laws of heat are so applied as to produce the greatest effect with the least consumption of fuel, without destruction to the Apparatus; and B. and H. can safely recommend it from experience, as unquestionably superior to anything of the kind hitherto made. A Prospectus can be forwarded, upon application, detailing particulars and prices, to 130, Fleet-street.

NEW GARDEN NET, 1½*d.* per yard, second-hand do., ¾*d.* per yard, quite perfect; Garden Net ½ inch mesh, warranted to protect the blossom, 2½*d.* per yard; a fibrous Hemp Net, New Hemp Net, 36 meshes to an inch, 7½*d.* per yard; Worsted and Woollen Nets, Net to fence out Hares and Rabbits, 2*d.* per yard, tarred; Tarpauling Frame Pit and Greenhouse Covers, 1*s.* per square yard; long Hare and Rabbit Nets on Cords, 50, 80, and 100 yards long. Upwards of 1000 London Policemen's Capes, 2*s.* and 2*s.* 6*d.* each, for Labourers, Gardeners, and Farm-servants. Flags, Banners, &c.

TO FARMERS.—Sheep Net, nearly 4 feet high, 4½*d.* per yard, of strong cord; Rick Cloths dressed with a pliable composition of Tar and boiled Oil, which never mildew or are touched by vermin, as follows:—for 30 tons of Hay, 30 feet by 30 feet, 5*l.*; 40 tons, 36 feet by 30 feet, 6*l.* 10*s.*; 50 tons, 36 feet by 36 feet, 7*l.* 10*s.*, complete with side lines. Early orders are respectfully solicited for these Rick Cloths to prevent disappointment. Dressed Waggon and Hay Cart Cloths, Expanding Tents (the only maker) for Lawns, &c., 36 feet round, 6 feet high in the lowest part, 5*l.*; 42 feet round, 6*l.* 10*s.*; 24 feet round, 4*l.*, put up or down in a few minutes, and require no side lines. Fishing Nets of all kinds. Nets to cover in Pheasants, Poultry, &c. 2*d.* per yard. Nets made to order. ROBERT RICHARDSON, Net, Tent, and Rick Cloth Maker, 21, Tonbridge-place, New-road, corner of Judd-street, London.

This day is published, price 1*s.* 6*d.*,

THE STATE and PROSPECTS of PENNY POSTAGE, as developed in the Evidence taken before the Posthge Committee of 1843; with Incidental Remarks on the Posthge Committee of 1843; with Incidental Remarks on the Testimony of the Post-office authorities, and an Appendix of Correspodence. By ROWLAND HILL.

London: CHARLES KNIGHT & Co., 22, Ludgate-street.

DEFEAT OF THE ANTI-CORN-LAW LEAGUE IN HUNTINGDONSHIRE.

THE SPEECH OF MR. GEORGE GAME DAY on that occasion, at Huntingdon, June 17, 1843, published by request, with notes and additions, 8vo., price 6*d.*

"One of the most able addresses ever listened to. MR. DAY took every argument of the Leaguers, and by the statistical information he had accumulated, entirely demolished them, tearing them to pieces, and hurling them in their teeth."—*Standard.*

"The Speech is calculated to be of great benefit. Its language is clear and forcible; and its arguments are so put as to be easily comprehended. The Agricultural body will do well to circulate the pamphlet extensively.—*Cambridge Chronicle and Huntingdonshire Gazette.*

*** AN EDITION OF THIS "MASTERLY AND UNANSWERABLE SPEECH" is now published for distribution, price 15*s.* per 100, or 6*l.* 6*s.* per 1,000.

London: JOHN OLLIVIER, 59, Pall Mall.

Just published, 5th Edition, price 6*d.*, or 100 for 2*l.*

THE COUNTER PLEA FOR THE POOR: a Refutation of the Assertions of the Anti-Corn-Law League, by the "Poor Man's Friend."

"He that tilleth his land shall have plenty of bread, but he that followeth after vain persons shall have poverty enough."—*Prov.*

"The author has executed his task in a most vigorous and effective style. Much good may be done by the extensive circulation of such expositions of Leaguite fallacies as are contained in the publication before us."—*Magnet.*

London: JOHN OLLIVIER, 59, Pall Mall.

On the 1st of February will be published,

PARNELL'S APPLIED CHEMISTRY IN MANUFACTURES, ARTS, AND DOMESTIC ECONOMY. 8vo., Vol. I., 12*s.* cloth. Contents:—GAS ILLUMINATION, PRESERVATION OF WOOD, and DYEING and CALICO PRINTING.

HEREFORD BULL AND COWS.

FOR SALE, by the breeder, a very valuable BULL, and two COWS (his half-sisters) fit to breed a herd, of which any Nobleman might justly be proud; they are purely Tomkins' blood, being closely bred to the following Bulls, which belonged to the late JOHN PRICE, of Pool House, Worcestershire, viz., Solon, or Prince Toby, Waterloo, Triumph, Young Lubin, Young Woodman, and their sons, Sovereign and Wormelow. To be seen, with their pedigrees, at Pencoyd, near Ross, Herefordshire.

AUSTRALASIAN COLONIAL and GENERAL LIFE ASSURANCE and ANNUITY COMPANY, 126, Bishopsgate-street, Corner of Cornhill.

Capital £200,000, in 2000 Shares.

DIRECTORS.

E. Barnard, Esq., F.R.S.
Robert Brooks, Esq.
Henry Buckle, Esq.
John Henry Capper, Esq.
Gideon Colquhoun, Esq.
C. E. Mangles, Esq.
Richard Onslow, Esq.
William Walker, Esq.

BANKERS.—Union Bank of London.

COLONIAL BANKERS.—The Bank of Australasia (incorporated by Royal Charter, 1835), No. 2, Moorgate-street.

PHYSICIAN.—Patrick Fraser, Esq., M.D., No. 62, Guildford-st.

SECRETARY.—Edward Ryley, Esq.

ASSURANCES may be effected with this Company at unusually favourable rates, affording every variety of accommodation to the Assured. Participation in Profits, ascending and descending scales of premium, permission to retain one-third of the premium, which is charged as a debt against the policy, tables for the assurance of a sum payable in the event of death to the executors of the Assured, or to himself upon the attainment of the ages of 45, 50, or 60.

To EMIGRANTS to the AUSTRALASIAN COLONIES assured for the whole life, this Company offers the advantages of permission to proceed to, to reside in, and to return from those colonies without extra premium, and to pay their premiums there.

All questions relating to Assurance and Annuities, addressed to the Secretary, will receive immediate attention.

ARGUS LIFE ASSURANCE COMPANY, 39, Throgmorton-street, Bank.

Empowered by special Act of Parliament, 5 & 6 W. IV., c. 76.

Thomas Farncomb, Esq., Alderman, *Chairman.*
William Leaf, Esq., *Deputy-Chairman.*

William Banbury, Esq.
Edward Bates, Esq.
Thomas Camplin, Esq.
James Clift, Esq.
Rt. Hon. J. Humphery, M.P., Lord Mayor of London.
Rupert Ingleby, Esq.
Thomas Kelly, Esq., Alderman.
Jeremiah Pilcher, Esq., Sheriff of London and Middlesex.
Lewis Pocock, Esq.

Physician—Dr. Jeafferson, 2, Finsbury-square.
Surgeon—W. Coulson, Esq., 2, Frederick's-place, Old Jewry.
Consulting Actuary—Professor Hall, of King's College.

Advantages of the Argus Life Assurance Company.

Low Rates of Premiums.

In addition to the subscribed Capital of 300,000*l.*, the Assured have the security of the Company's Income of nearly 60,000*l.* per annum, yearly increasing, and accumulating Assurance Fund invested in Government and other available Securities, of considerably larger amount than the estimated liabilities of the Company. The Rates of Premium are reduced to the lowest scale compatible with the safety of the Assured and the stability of the Company, thereby, in effect, giving to every Policy-holder an immediate and certain bonus without risk, in lieu of the deferred and frequently delusive prospect of a periodical division of profits.

Annual Premium to Assure £100.

Age.	For One Year.	For Seven Years.	Whole Term.
20	£0 17 8	£0 16 1	£1 11 10
30	1 1 8	1 2 7	2 0 7
40	1 5 0	1 6 9	2 14 10

60	3 2 4	3 17 0	6 0 10

One-third of whole-term Premiums may remain unpaid at 5 per cent. comp. int. as a debt upon the Policy for life, or may be paid off at any time without notice.

In Assurances for advances of money as security for debts, or as a provision for a family, when the least present outlay is desirable, the varied and comprehensive Tables of the Argus office will be found to be particularly favourable to the Assured.

A Board of Directors, with the Medical Officers, attend daily, at a quarter before 2 o'clock,

EDWARD BATES, Resident Director.

A Liberal Commission to Solicitors and Agents.

News of the Week.

THE report of the State trials in Ireland in our Paper of this day, brings down the account of the prosecution to the close of the 10th day. The greater part of the week has been occupied with the examination of witnesses on behalf of the Crown, to prove the speeches delivered by the traversers at the different meetings, and the various proclamations and documents published by the Repeal newspapers. The cross-examination of these witnesses appears to have been directed not so much to questions of fact or of credibility, but to prove the peaceable character of the meetings, and the uniform good conduct of the people who attended them. The case for the prosecution is expected to close this week; and the defence, it is said, will be commenced by Mr. Shiel on the part of Mr. John O'Connell. The counsel for the other traversers will follow, and Mr. O'Connell will conclude the defence by addressing the Jury on his own behalf. It is stated, that the traversers have about four hundred witnesses to examine.—Her Majesty's Speech at the opening of Parliament, which will take place on Thursday next, will make, it is said, a strong and marked reference to the state of Ireland, and to the means adopted to maintain the Union inviolate.

From France we have accounts of the adjourned debate on the Address, which has proved thus far favourable to the Cabinet. In this important debate, the questions of the English Alliance, the Commercial Treaty, and the Right of Search, were brought under discussion, and the relations of France and England in all parts of the world were fully canvassed by the contending parties in the Chamber. The result has proved in every respect satisfactory to the friends of peace, and the paragraph of the Address expressing gratification at the cordial understanding with this country has been adopted by a large majority.—The news from Spain is unimportant, relating chiefly to the continued success of the Opposition candidates, and to the domestic policy of the Cabinet. The intended return of Queen Christina appears to be no longer doubtful; and addresses have been forwarded to her from Barcelona, praying her Majesty to pass through that city on her way to Madrid.—From Greece we have accounts of the dismissal of M. Rhigas Palamedes from the Ministry by the advice of his colleagues, on the ground of his being the leader of the exclusive party

which has adopted the French views of government, and carried them to excess. The constitution of an Upper House or Senate is still the subject of discussion, and the question whether the senators shall be appointed by the King or chosen by the people, is the chief topic of the day.

Home News.

COURT.—Her Majesty, Prince Albert, the Prince of Wales, and the Princesses, continue at Windsor, and are in excellent health. The Queen has taken her usual exercise in the grounds of the Castle during the week, and the Prince has shot over the Royal preserves, and hunted with his harriers. According to present arrangements, her Majesty, who will open Parliament in person on Thursday next, will take her departure from Windsor for Buckingham Palace on Wednesday morning. It is expected that the stay of her Majesty in town will not extend beyond a week or ten days, when the Court will return to Windsor, and remain at the Castle till a somewhat advanced period of the spring, most probably until the middle of April. Lady C. S. Cocks and the Hon. Miss F. Devereux have succeeded the Hon. Misses Liddell and Hamilton as Maids of Honour in Waiting on her Majesty. The following have been staying at the Castle this week on a visit to the Queen:—the Duke and Duchess of Cambridge, the Princess Mary, and the Earl of Aberdeen. The Duke of Cambridge left the Castle on Monday morning for Arundel Castle, on a visit to the Duke and Duchess of Norfolk.

Spring Assizes, 1844.—The Judges of the different Courts met on Thursday in the Exchequer Chamber, and chose their respective circuits on the ensuing Spring Assizes. The following is the arrangement:—*Home Circuit*—Chief Justice Denman and Baron Alderson. *Midland*—Chief Justice Tindal and Baron Gurney. *Norfolk*—Chief Baron Abinger and Justice Patteson. *Oxford*—Baron Parke and Justice Coleridge. *Northern*—Justice Coltman and Baron Rolfe. *Western*—Justices Wightman and Cresswell. *South Wales*—Justice Williams. *North Wales*—Justice Maule. Justice Erskine remains in town, and will attend business at chambers.

Death of Sir Francis Burdett.—On Monday last, Sir F. Burdett, M.P. for North Wilts, and formerly so prominently before the public as representative of Westminster, expired at his residence in St. James's-place. The death of Lady Burdett which took place only ten days since had a powerful effect upon the deceased Baronet, whose impaired constitution was not able to bear up against his bereavement. Sir Francis Burdett was for a long course of years one of the most prominent political characters of the age. At an early period of his career he was the most uncompromising advocate of Parliamentary Reform, and under his *sobriquet* of "Old Glory" was perhaps the most popular man of his day. He was born in 1770, and was educated at Westminster School. Whilst in his 23d year he married the youngest daughter of Thomas Coutts, Esq., the celebrated banker, and shortly after entered Parliament as member for Boroughbridge. In 1807 he appeared for the first time on the hustings as a candidate for Westminster, and was returned by a triumphant majority. In 1612 he was committed to the Tower for the intemperate language he had used in a printed letter, addressed by him to his constituents on the commitment of Mr. Gale Jones for a breach of Parliamentary privilege. In 1819 Sir Francis again addressed a printed letter to his constituents, in which he descanted in unmeasured terms upon the proceedings at Peterloo. For this offence he was tried in the Court of King's Bench, and was condemned to three months' imprisonment and a heavy fine. He continued to represent Westminster until 1837, when he was returned for the Northern Division of Wilts on the Conservative interest; a vacancy is therefore occasioned in the representation of this county by his demise.

Foreign.

FRANCE.—The debate on the Address was resumed on Thursday, when a long and desultory discussion ensued on the commercial condition of the country, which ended in the rejection of all the amendments and the adoption of the first paragraph of the Address. On Friday the discussion was continued, and the second and third paragraphs were adopted. The first of these states that the equilibrium between the receipts and the expenditure has been re-established, and the other proclaims sympathy for Polish nationality. The debate then commenced upon the fourth paragraph, or in other words on the affairs of Greece and Spain, and on the amicable relations between France and Great Britain. The general debate upon these subjects was entirely confined to three members of the Opposition, MM. de Lasteyrie, Garnier-Pages, and Ducos, and so little impression did their remarks make, that none of the members on the Ministerial benches thought it worth while to answer them. The object of their speeches was to show that in Spain as well as in Greece the objects of France and England must always be different; that England was not sincere in its apparent friendly relations; and that its object always was by means of commercial treaties or otherwise to gain some advantage over France. In the latter part of the sitting the discussion became more animated, when M. Billault rose to move an amendment of which he had given previous notice, and which it is understood that the different sections of the Opposition have agreed to support. The object of this amendment is, instead of the "cordial understanding," which the Speech says is the state of the relations between the Governments of France and England, to substitute words in the address of a more reserved and less confidential construction. M. Billault entered at great length into the foreign policy of England, and the *Journal des Débats* observes that "he explored the whole world, visiting Greece, Spain, Algeria, Servia, Jerusalem, New Zealand, and Madagascar, in order to prove that France and England are now what they were at Poictiers and Agincourt, and that a traditional and permanent enmity has survived the march of intellect and civilisation." On Saturday the Chamber was crowded with company, in the expectation that the Minister of Foreign Affairs would reply to the attacks made upon the Cabinet the day before. The debate was preceded by a report of a committee upon the election of M. Charles Lafitte, at Louviers. The committee proposed his admission. It was opposed by M. Grandin, who declared that what had passed at Louviers in connexion with the opening of a branch railway between Louviers and the Paris and Rouen railroad, exceeded all that had been heard of in the way of electoral corruption, stating that M. Lafitte had promised to construct a railway for his constituents as a bribe for his election. M. Lafitte repelled the imputation, and M. Dufaure demanded an inquiry into the alleged circumstances. M. Lafitte himself demanded an inquiry amidst much noise, but the election was annulled by a large majority. The sensation caused by this incident was such that the sitting was interrupted for 20 minutes. Silence however was restored on M. Guizot ascending the tribune, and the debate on the address was resumed. After showing that France and England were in accord in respect to Greece, but claiming for France the honour of having taken the initiative in that respect, M. Guizot proceeded to exonerate this country from blame for having omitted to ask of the French Government the *exequatur* for the British Consul in Algeria. The Porte had not yet recognised the sovereignty of France in that colony. Great Britain felt therefore unable, however willing, to ask for an authority for one of her agents which would be a virtual acknowledgment of the title of France to Algeria. He also stated that France and England were agreed respecting the independence of the Sandwich Islands, the independence of which they had both acknowledged. "We wished," said M. Guizot in conclusion, "a real and sincere peace. We conceived, and it was likewise conceived in London, that there was room in the world for our two independent and national policies, provided they should be kept within the bounds of justice and good sense. Both Cabinets, to their honour as well as to the advantage of their respective countries, have commenced and inaugurated that policy of real and sincere peace—a policy both novel and difficult, but nevertheless the only good and honourable policy—which although prudent and moderate, is not divested of grandeur, and which for being honest is not the less useful. This is what we call the 'cordial understanding' between the two Governments. I will not dwell on facts purely personal, which were alluded to yesterday with so much disdain;—I will not speak of that mark of friendship given by a young and charming Queen to our King, our Government, and our revolution;—I will not speak of the fact which followed that visit—the treatment experienced by the Duc de Bordeaux—who was not received in London by the Sovereign who had come to France to meet our King. These are striking facts which have produced in Europe a deep impression on kings and nations—facts which have everywhere been justly appreciated, and which have occupied the imaginations and conversations of all Europe. I leave them aside however serious they are in reality." When M. Guizot had concluded, M. Billault rose and asked him if it was true that a commercial treaty was on the tapis between England and France? M. Guizot replied, that commercial negotiations had been for some time pending between the two countries; but that none of the great manufacturing interests of France—the iron, thread, linen, cotton goods, &c.—would have been importantly affected by those negotiations, which were however now altogether suspended. M. Billault attempted a reply, but only repeated arguments he brought forward on Friday. On Monday the debate was opened by M. Thiers. He said that from 1830 to 1836 the alliance with England had been intimate, that between 1836 and 1839 it was slackened, and that in 1840 it was severed. It was this alliance which it was now sought to revive and to represent as existing in 1844. England had given proof of interest to France in 1830, and when the separation of Belgium and Holland took place, an event which was the origin of the alliance; but in all other circumstances England had proved contrary to the interests of France, and from 1836 that boasted alliance had been but a fiction which yielded but checks to France. That alliance formerly so momentous to the peace of Europe had no longer the same importance and was no longer a guarantee of peace. M. Thiers then reviewed the events which had occurred and the policy pursued in Spain, Greece, and on the part of Russia, &c. He urged that the Cabinet followed in the wake of England and that its anxiety to restore the alliance opposed the object it had in view. He was violently interrupted when he declared that the Cabinet had trodden upon the resentment of the country. He concluded by asserting that the results of its policy justified what he had stated, and that in labouring to bring the two countries together again, and assuming the initiative of that resolution after the resentment excited in 1840, it had completely disregarded the feelings of France. M. Guizot immediately answered this speech and commenced by examining the system pursued by M. Thiers while he held the reins of government, and described him as endeavouring to steer a middle course for fear of impairing his popularity, and seldom taking a decision. In Algeria for instance, M. Thiers had formerly entertained excellent views respecting the mode of consolidating the power of France in that country; in 1837 he complained that the war was not properly carried on; since then he had been in office, and the war was conducted in the same slovenly manner as before, and it was the present Cabinet that had had the merit of remedying the evil, and of sending to Algeria a general who had changed the system of warfare, and reduced the country to submission. M. Guizot then referred to the situation in which he found the foreign relations of France and that in which they were now, and contended that peace would not have been as stable as it is in 1844 if he had not followed a truly national policy. There was no alliance, properly speaking, between England and France; but there was a "cordial understanding" and a perfect accord between them, and neither had alienated any portion of its liberty or independence. Their relations were benevolent and loyal not only in words but also in deeds. France had made no concessions to England. M. Guizot then proceeded to vindicate his policy in Spain, in the East, and in Servia, in nearly the same terms as in the speech which he delivered on Saturday. After a few words from MM. Salvandy, Girardin and Dupin, the latter of whom supported the Ministerial views if confined solely to the accord between France and England in regard to Greece and Spain, the debate was brought to a conclusion, when the Ministry came off victorious, and a majority of about 40 declared in favour of the general foreign policy of M. Guizot and of the cordial relations of England with France. On Tuesday the discussion opened on the fourth paragraph of the address relative to Spain, Greece, and the understanding with England, another amendment more favourable to Greece having been moved by M. David. After some words from M. Guizot it was withdrawn, and the paragraph was then suffered to pass as worded by the committee. The 5th paragraph, relative to the "Right of Visit," was then taken into consideration, and M. Billault proposed an amendment, "that the good understanding with England would no doubt promote the success of negotiations which by guaranteeing the repression of an infamous traffic would again place the commerce of France under the exclusive protection of her flag." The debate was terminated by M. Guizot rising and saying "that he accepted the paragraph of the address not with any reserve but in its full expression, his serious aim being to replace French commerce under the protection of its national flag." M. Billault then withdrew his amendment for the sake, it is said, of unanimity.

SPAIN.—We have advices from Madrid to the 16th instant. The returns of the electoral colleges of the rural districts of the Province of Madrid had not yet been sent in, but the immense majority obtained by the Progresista candidates in the City left no doubt as to their success. M. Olozaga, although the last on the list, would nevertheless be among the chosen to sit in the Chamber, it being agreed that one of the five successful candidates would resign in his favour. It was supposed in some quarters that the Ministry would not submit to that humiliation, but would dissolve the Cortes. Persons acquainted with the designs of the Cabinet were, nevertheless, of opinion that the dissolution would not be immediate. The execution of the new municipality law experienced little or no obstacle throughout the kingdom, and it was expected that when once enforced, and when the Ministry should have been assured of the certainty of carrying the elections through the agency of alcaldes devoted to their interests, they would not hesitate to announce the dissolution. The Queen had refused to accept General Narvaez's resignation of the rank of Captain-General, to which His Majesty had promoted him on the 6th inst. Harmony was restored between the family of the Infante Don Francisco and the Government, who had just conferred the command of the brig Manzanarés on the young Infante Don Enrique. After finally annulling the contract with M. Salamanca, the Minister of Finance had addressed a communication to the superior Council for the selling of national property to the effect that the sales be proceeded with according to the laws and regulations in force before the 31st of August, 1843. By another communication the Director-General of the public Treasury is ordered to recover immediately the sums still due for the national property that has been sold. A decree was expected shortly to be issued for the better maintenance of public worship and the clergy.—The Barcelona journals of the 14th inst. publish addresses of the provincial deputation and Ayuntamiento of that city to Queen Christina, entreating Her Majesty to visit Barcelona on her way back to Madrid.

GERMANY.—We learn from the Berlin journals of the 18th that the Queen of Prussia is suffering from measles. The following bulletin was published on the 17th:—"The Queen has passed an agitated night. Her cough was frequent, but the progress of the malady is regular, and inspires no anxiety."—The *Augsburgh Gazette* of the 19th states, from Goritz, that the physicians of the Duc d'Angoulême have declared their patient to be suffering from a disease of the intestines, with cancer, but that if he should live until the spring he may hope for a permanent recovery from sea bathing.—A letter from Carlsruhe of the 10th inst. states that a wanton attack had been made on the palace of the hereditary Grand Duchess of Baden near that city, which was entered by means of false keys and the furniture destroyed, the paintings cut to pieces, the statues and valuable porcelain broken, but nothing stolen. The police were endeavouring to discover the authors of this outrage.

GREECE.—Accounts from Athens of the 31st ult. announce the dismissal from the Ministry, by the advice of his colleagues, of M. Rhigas Palamedes. Much difference of opinion still continued to exist relative to the con-

...ance of an Upper House of Parliament or Senate, some ...rances desiring that the Senators should be appointed by ...the King, and others insisting that they should be chosen ...by the people, on the plan of the Belgian or Spanish con... ...stitutions.—The following account of parties is from a ...Vienna paper :—"The moderate party are decidedly the ...supremost in the Assembly, of which the parties and ...sections may be classed as follows :—First, the Anarchist ...and Exclusive party, composed of the wildest of the French ...party with Riga Palamedes for its chief. This is the least ...numerous and the boldest party. Secondly, the Ultra-...Nappist as turbulent and anarchic, but more numerous ...and more cunning; it brings fanatical ideas and religious ...zeal to its aid. Thirdly, the English party under Mavro-...cordato, swelled by the most honest and moderate of the ...Napoleons, who have refused to follow the subversive policy ...of their old chiefs. Fourth, the French party and Coletti, ...supported by the warriors of Roumelia. The two last ...have coalesced for the support of the constitution allied ...to royalty."

RUSSIA.—Letters from St. Petersburgh of the 8th inst. ...state that the celebration of the betrothal of the Grand ...Princess Alexandrina Nicolaicona, youngest daughter of ...the Emperor, with Prince Frederick of Hesse, heir pre-...sumptive to the Danish Crown, took place on the previous ...day at the Winter Palace. After the ceremony the be-...trothed presented their thanks to their Majesties, who ...then joined in their congratulations with all the other ...members of the Imperial family. The Patriarch, assisted ...by the other high dignitaries of the church, celebrated a ...*Te Deum*, and when the usual prayer for the prosperity ...of the Imperial family was said, a salute of 104 guns was ...fired from all the fortresses. The religious ceremonies ...having concluded, the members of the Holy Synod offered ...their congratulations to their Majesties and the young ...couple. A banquet was afterwards given in the great ...marble hall to the nobility of the three first classes of ...rank, and in the evening there was a full dress ball in St. ...George's Hall, which was attended by all the foreign am-...bassadors, ministers, and their suites, and all distinguished ...foreigners. The bells of all the churches rung merry ...peals from sunrise to sunset and at night the whole city ...was brilliantly illuminated.—Accounts from Circassia an-...nounce that Schamyl, chief of an eastern tribe of the Cau-...casus burst with 10,000 men in September among the ...tribe of the Ouars, and attacked the Russian fortress of ...Ourous. There were three companies in it. Cutting off ...the water from them the Circassians compelled the three ...companies to surrender. Lieutenant-Colonel Wassilizki ...marched to the relief of the fortress, but was cut off by ...Schamyl. General Plagenau then marched to redeem ...matters, but he was cut off from his supplies and forced ...to take refuge in the fortress of Chousak. Schamyl soon ...besieged it. Prince Argatinsky was obliged to march to ...his succour and it was only by dint of fighting his way ...through the Circassians that Gen. Plagenau succeeded in ...joining him. He lost 1600 soldiers and 45 officers in the ...attempt. Schamyl has sent three emissaries amongst the ...Circassians, the Cabardians and the Abaraks, to announce ...his late victories and to encourage them to harass the ...Russians on the Cuban, and to attack the fortresses on ...the borders of the Black Sea. General Gourka has set out ...from Stauropol to proceed to Dagestan where he will take ...the command-in-chief.

TURKEY.—Advices from Constantinople of the 3d inst. announce the dismissal of Sir Baldwin Walker from the Ottoman navy, owing to the resentment of the Capoudan Pasha, whose conduct while lately cruising in the Archipelago would appear to have roused the indignation of our gallant countryman.

CITY.

Money Market, Friday. — Consols closed at 97 $\frac{3}{8}$; Three per Cents. Red., 98$\frac{1}{8}$; Three-and-Half per Cents., 101$\frac{1}{4}$; Bank Stock, 192; Exchequer Bills, 66*s.* to 68*s.* pr.

Metropolis and its Vicinity.

Anti-Corn Law League.—The League held their first aggregate meeting for the present year on Thursday night, in Covent Garden Theatre. Mr. Wilson, the Chairman presided, and the meeting was addressed by the Hon. E. Bouverie, Mr. Fox, Mr. T. M. Gibson, and Mr. Burnett, of Camberwell; after which the Chairman announced, that the present was the first of a series of meetings which would be held in that theatre for some time to come.

Popular Education.—Another meeting in favour of popular education took place at Craven Chapel on Monday, Mr. Hindley M.P. in the chair, supported by several ministers of different dissenting bodies. Mr. James explained the object of the meeting, and stated that they had determined to raise the sum of 100,000*l.* in five years for the purpose of educating the people. Of that sum 22,771*l.* 10*s.* had already been raised, more than one-half of which had been collected in the metropolis alone. Dr. Liefchild proposed the first resolution, approving of the proceedings lately adopted at the conference at Leeds. He expressed a high respect for existing establishments, and he remarked that if any amongst them became partisans he would not be classed with them, as he was not of their church. Mr. J. Burnett seconded the resolution. Dissent he said was instruction, and instruction was dissent, and the moment instruction went down dissent ceased to exist. The Church of England had had the education of the people in her own hands for nine centuries, and at the close of that time she found them bordering upon infidelity. Education then was required—the state of the world required education; and the state of the press required education, for that alone could save the people from its pernicious influence, teeming as it did with everything that was calculated to vitiate and corrupt the morals of the community. Mr. S. Martin proposed the next resolution, repudiating the spirit which subordinated the public welfare to sectarian objects, which being seconded by Dr. Reed was also agreed to. A resolution expressive of approbation of the principles of the British and Foreign School Society was also carried. —From a return made to the visiting justices of the House of Correction, it appears that out of 1094 prisoners confined in that prison on the 13th inst., viz., 834 males and 260 females, it was ascertained that nine females only could read and write well, with a knowledge of other languages and arithmetic; 92 males and 25 females could read and write well, with arithmetic; 258 males and 60 females could read and write a little; 274 males and 105 females could only read a little; and 209 males and 70 females could neither read nor write at all.

British and Foreign Institute.—His Excellency Sir Charles Metcalfe, Governor-General of Canada, has become a life member of this Institute, and transmitted 100*l.* as a donation towards its library. The institute is to be opened by a *soirée* on Friday the 2d February, when Prince Albert has communicated his intention to honour the opening with his presence. The President, the Earl of Devon, will take the chair.

Metropolitan Drapers' Association.--The second annual meeting of this association, the object of which is to shorten the hours of business in the shops of the metropolis by closing them at 7 o'clock, was held on Tuesday at Exeter-hall, under the presidency of Mr. Emerson Tennent, M.P. The hall was densely crowded in every part. The report of the Central Committee was read at length, and stated that notwithstanding the disappointments and difficulties which at the outset had to be encountered and overcome, an amount of success had been achieved in the past year far beyond what any previous efforts had been able to attain. By the exertions of the committee the "evening trade" in London had materially decreased, and they referred with satisfaction to the example which many leading establishments had set in closing at 7 o'clock—an example which had been followed in Liverpool, Manchester, Edinburgh, Glasgow, Cheltenham, Bristol, Coventry, Bedford, Newcastle, Nottingham, Wolverhampton and other great manufacturing towns. Resolutions in favour of the association and pledging the meeting to exertions in its support were proposed and carried unanimously, and the interests of the society were advocated by the chairman, Mr. Hindley, M.P., Rev. Mr. Cumming, the Rev. Mr. Hughes, Dr. Reid, Mr. Hitchcock of St. Paul's Church-yard, and several other large employers.

State of the Streets.—On Tuesday at the sitting of the Commissioners of Sewers, Alderman Gibbs in the chair, the imperfect manner in which the principal thoroughfares of the City are cleansed under the present contract with Mr. Gore was brought on for discussion. The patentees of the new street-sweeping machine expressed their regret at being unable to take the contract for the whole city, in consequence of not being provided with sufficient places of deposit for the soil collected by the machines. In the south division of the west district the company had obtained a wharf by the river side, and were prepared to take the contract for this division for the amount which, under the existing agreement with the contractor, they were entitled to receive for the hire of the eight machines during the same period. If this opportunity was afforded to the patentees, they would be able to show what the machines would accomplish with proper management in the crowded thoroughfares of Ludgate-hill and Fleet-street, where the difficulty of cleansing was at least as great as in any other portion of the City. Mr. Gore was under contract to pay 1600*l.* for the hire of eight machines which had been supplied to him by the patentees, and worked by him up to a recent period. If however the above arrangement were entered into, the patentees expressed their willingness to release Mr. Gore from his liability under that contract. After the reading of the letter the several parties were called in, and various questions were put to each as to the working of the machines. Mr. Gore and his foreman declared that they were totally useless in "greasy" weather; the latter assuring the Court that on a day like Monday, when the streets were neither very wet nor very dry the machine would travel from St. Paul's to the Mansion-house and the brooms not make more than two revolutions, the wheels of the machinery being as stationary as if a "skid" were applied to them. This it was contended ruined the horses employed to draw them, and left the streets in a worse state than under the old system of manual labour. Mr. Whitworth contended that the alleged failure of the machine arose entirely from mismanagement, and a determination on the part of the contractor not to adopt the new system. He further stated that the whole of Manchester, presenting a surface of greater extent but requiring about an equal amount of labour as that of London owing to the excess of traffic in the latter, was swept by the machines. They had however 18 machines in use there, while Mr. Gore had only eight to cleanse the City of London, although he had been offered the use of as many as he chose to find horses to work. Mr. Gore was informed that as the offer of the patentee was considered extremely liberal, the Court was desirous to know whether he was willing to accede to it. He requested time to consider the matter, and it was at length arranged to allow the matter to stand adjourned until Tuesday next, then to be finally determined on.

Increase of London.—In consequence of some complaints of an increase in the police of about 150 men, the commissioners have caused an inquiry to be made into the number of additional houses erected in the immediate vicinity of the Metropolis since the establishment of the force. From the official return just presented to Government, it appears that since 1829 no less than 45,000 new houses, forming 750 new streets and squares, have been erected, or are in the course of building in London and its suburbs. An extra duty is thereby imposed on the police of having to watch and walk over 110 additional miles daily. This increase will be best comprehended by reflecting that 3214 houses (the annual average of new buildings) would constitute a town of no inconsiderable size; and that since the period in question fourteen such have sprung up around the Metropolis.

Custom-house Frauds.—Another house in the same line of business as Candy and Co. and on a scale nearly as extensive, lately received notice of proceedings instituted against it for Custom-house frauds. The trial was to have taken place in a few days but will now be of no avail, as the firm shut up their premises on Thursday evening, having clandestinely sold off all their goods and collected the debts owing them. The parties it is said were extensive proprietors of land, and of a great many houses in Bow, but contrived to sell the whole a few weeks ago, investing the proceeds in the French funds. The result is, that there will not be a farthing to the Crown. The parties lived in great style, severally keeping their carriage, and each it is said realising 12,000*l.* a year by the business.—Considerable surprise was excited on Friday in the City by the announcement that a Custom-house agent whose legitimate business-profits were not less than 5000*l.* a year, had absconded in consequence of charges connected with the Custom-house frauds. This agent had for years been employed in clearing at the Custom-house silk goods for the principal houses at the west end. It is understood that though he had long been suspected by the authorities it was only very recently that any tangible proof could be obtained against him.

National Gallery.—On Tuesday a lame man called William Adams destroyed a valuable painting of "Jupiter and Leda," by Mola, in the National Gallery, by striking it with his crutch. So violent was the blow, that one of the witnesses likened the act to that of striking down a bullock. The man was at once taken before the police and remanded, to give the magistrate time to examine the Act of Parliament relative to his jurisdiction. On Wednesday Mr. Maltby said he had carefully considered the Act of Parliament. The picture was sworn to have been worth from 150*l.* to 200*l.* It was now comparatively worthless. He regretted that he could not inflict a higher penalty than 5*l.*, or two months' imprisonment with hard labour. The prisoner said that as business had latterly been very bad, and he was afflicted with a diseased leg, he had at times become affected in his head. On the day when he committed the mischief, he had gone out with the intention of asking his surgeon to remove his afflicted limb, and after walking about some hours he had entered the National Gallery to relieve his mind. He could not account for the impulse which had led him to injure the painting, and much regretted what had occurred. He was unable to pay the fine, and was removed in custody.

Bank of England.—The continued rise in the value of Bank Stock is attracting some attention in the monied circles, and the anticipated renewal of the charter is assigned as the cause of the advance. It is even asserted that Ministers have promised to support the case of the Bank in Parliament, and that the terms on which this favour is to be shown are, an advance by the Bank Directors, should occasion require, to meet those parties who may desire to be paid off in full, under a conversion of the 3$\frac{1}{2}$ per Cents. Reduced, should such financial operation take place.

Discovery of Human Skeletons.—On Saturday the 13th the skeleton of a female, about 25 years of age, with the hair beautifully braided, and a large fracture in the back of the skull, was discovered on Blackheath, near the foot of Shooter's Hill; and since that day, the skeleton of a child, about 10 years of age, has been found on the same spot. The skull of the latter was much broken and decayed. A heavy piece of iron, apparently part of a mortar-shell, was also found. It was at first supposed that the bodies had been murdered by highwaymen; but from the depth of earth and regularity of interment it is now supposed that robbers would not have remained long enough to bury them in such a manner.—The skeletons of two men were found near the Potteries at Notting Hill last week, at the root of a tree on the Norland Estate, on which a new town is now erecting.

Monument to Dr. Watts.—A public meeting was held last week in the City, Mr. Hankey in the chair, at which it was resolved to erect a monument to the memory of Dr. Isaac Watts. The meeting was addressed by several gentlemen, and a subscription was opened to defray the cost of the monument.

Oastler Liberation Fund.—A meeting of the London committee formed for the purpose of raising subscriptions to release Mr. Oastler from imprisonment and to provide an annuity for his future support was held on Wednesday at the British Hotel, Cockspur-street. It was announced that owing to the exertions of the provincial committees and of the country nobility and clergy great hopes are entertained of the release of Mr. Oastler in the course of a short period. Meetings of his friends and supporters had been held in various districts of the north, and one had been held at Dublin on Tuesday, at which Mr. Ferrand, M.P., was present. Lord Feversham, Sir G. Sinclair, Mr. Walter, Mr. Fielden, and Mr. Ferrand, have consented to act as trustees of the fund.

East India House.—On Wednesday a ballot was taken at the East India House for the election of a director in the room of W. Stanley Clarke, Esq., deceased. At six o'clock the glasses were closed and delivered to the

scrutineers, who reported the election had fallen on Major James Oliphant.

Camberwell.—On Sunday morning the Rev. Henry Melville preached his farewell sermon at Camden Chapel. The spacious Chapel was densely crowded, and hundreds were compelled to retire, unable to obtain admission.

Mortality of the Metropolis.—The number of Deaths registered in the week ending Saturday, the 13th, was as follows:—West Districts, 138; North Districts, 185; Central Districts, 178; East Districts, 189; South Districts, 239: Total, 929; (Males, 470; Females, 459). Average weekly Deaths for the last five years, 946.

Provincial News.

Incendiary Fires.—On Friday a man named Challis, a groom in the service of Mr. S. P. Mathews, of Campion Farm, near Harlow, Essex, was committed for trial on the charge of having fired the farming premises on the night of the 18th ult.—Two men named Langley and Amsden, the former keeping a petty chandler's shop at Langley Broom, between Slough and Colnbrook, and the other a shoemaker lodging in the same house, were committed by the Eton bench of magistrates on Monday to take their trial for arson. They had set fire to their house, and decamped with a quantity of goods, but were apprehended at Slough where they were awaiting the departure of the railway train for London.—On Thursday a large barn, containing 100 quarters of barley on the farm of Mr. Hall, at Eaton, near St. Neott's, Huntingdonshire, was destroyed.—On Sunday a stack of oats on the farm of Mr. Abbott, of the Manor House, Belchford, Northamptonshire, and nine stacks of corn and two of hay on the joint tenements of Mr. Thompson and Mr. Sanderson, at Crowland, were destroyed.—On Monday a long range of sheds and a cottage on the farm of Mr. Marsh of Deentheroe, near Weldon, the property of the Earl of Cardigan, were destroyed; and a man named Cooper, a Chartist preacher at Weldon, has been apprehended on suspicion.

Birmingham.—On Tuesday night a meeting of the committee formed in favour of the League was held in this town, Mr. H. Smith in the chair, supported by numerous merchants and manufacturers. An address to the manufacturers and other inhabitants of Birmingham and its neighbourhood was adopted, informing them that a great meeting will speedily be held to promote the objects of the League and calling on them to attend.

Brentwood.—On Saturday last David Kimpton, who had been brought from Ilford gaol by a superintendent of the rural police in the neighbourhood, was finally examined before the magistrates on a charge of poaching upon the preserves of Edwin James, Esq., at Herongate, and desperately assaulting two keepers in the service of that gentleman. The particulars of this affray were given in this Paper on the 13th, and it was stated that the ringleader had been captured. This man, called James Boulding, was examined on the next day and committed for trial. His accomplice, the present prisoner, was also committed on Saturday to take his trial at the next assizes.

Buckingham.—The seventh annual dinner of the Buckingham Conservative Association took place on Tuesday, in the Town Hall, the Duke of Buckingham in the chair, supported by Lord Orkney, Hon. Capt. Fitzmaurice, M.P., Sir Thos. Fremantle, M.P., and a large number of landowners and farmers. After the usual loyal and routine toasts, followed by speeches from the Rev. J. Coker, Mr. Grenville Pigot, Mr. E. F. Dayrell, and Lord Orkney, Sir Thos. Fremantle returned thanks on behalf of Ministers. He said it would be improper for him to enter into an elaborate explanation and defence of the Ministerial policy. Time alone could bring perfectly to light the result of that policy. With respect to the past he had reason to believe that the measures already taken had met with success, and let them further hope that they would be attended with the objects for which they had been devised, and conduce to the happiness and contentment of all classes of her Majesty's subjects. Mr. Dayrell commented with severity on the Canada Corn-bill and other recent measures, and expressed his fears of their ultimate working. Lord Orkney also condemned many of the late changes, and deplored the effects arising from the Government policy, though on the whole he was friendly to Ministers. In returning thanks as one of the Borough members, Sir T. Fremantle alluded to the League agitation and expressed his belief that agriculturists had nothing to fear from it. He had no doubt, he said, that the present law would be maintained, and he considered the country not prepared for a total repeal. Sir J. Chetwode then proposed "The health of the chairman." The Duke of Buckingham, in returning thanks, said he perceived that Sir H. Verney had at a meeting at Buckingham the other day charged him with inconsistency in his conduct to the agricultural interest. He did not see how that word could properly be applied to him, who for 25 years had adhered steadily and he hoped honestly to the principles which had first procured him their suffrages as Member for the county, until he had at length given up office because he could no longer support those with whom he was then joined. At the same time he did not believe the Hon. Baronet meant to make a personal attack, but he could not allow the opportunity to pass of defying any man to charge him publicly with inconsistency. It had been painful to him to differ from those with whom he was politically and personally connected, but there was no man with whom he would not differ if he thought his duty required it. He had never factiously supported or opposed any Government, nor would he now do so, but would do that which he believed to be for the good of the country. Whatever influence he might possess in that county should be given to Ministers according to their conduct to the Agricultural interest. If they supported the farmers he would support them—if they did not he would oppose them. His Grace in proposing "The British Farmer, and Success to Agriculture," observed that he did not think Sir R. Peel would sacrifice the interests of Agriculture; but if a Minister could bring himself to sacrifice it, he thought he ought not to remain in office 48 hours.

Canterbury.—On Saturday last a meeting composed chiefly of tenant-farmers was held in this city to adopt a petition for the protection of Agriculture. Sir Brook Bridges presided and was supported by Sir E. Dering, Mr. Plumptre M.P., and from 400 to 500 landowners and farmers. A petition to Parliament was agreed upon and the meeting expressed their determination to resist the progress of the League and to do everything in their power to support the interests of Agricultural protection.

Carlisle.—A numerous preliminary meeting of the Agriculturists of Cumberland was held in this city on Saturday to consider what measures should be adopted in the district for the purpose of counteracting the agitation of the Anti-Corn-law League. T. H. Graham, Esq., of Edmond Castle presided. The propriety of immediately forming a protective association was unanimously recognised, and resolutions were adopted declaring the opinion of the meeting that the agitation of the Anti-Corn-law League is not only dangerous to the welfare of this nation, but if successful must eventually prove destructive to the interests of all those engaged in the cultivation of the soil and in every other branch of industry; that measures should be immediately adopted to organise an efficient association in the county for the protection of British industry; and that a meeting of the friends of protection be held in Carlisle on 3d February for the purpose of forming the association and adopting resolutions calculated to oppose the proceedings of the League.

Horncastle.—On Saturday a numerous meeting of farmers and others in this part of Lincolnshire was held in this town for the purpose of considering the best means of securing protection to the agriculturists. Sir H. Dymoke, Bart., presided. Resolutions were passed expressing the alarm of the meeting at the proceedings of the League, deprecating the further reduction of duties on foreign agricultural produce, and adopting petitions to both Houses of Parliament to be prepared for every parish, praying "that there may not be further reduction in the present inadequate laws affecting agricultural produce."

Isle of Man.—On Sunday morning the 14th a fire broke out in King William's College at Castleton, by which the whole of that extensive building has been totally destroyed with the exception of the Vice-Principal's house. There were about 60 boys sleeping within the college at the time who were obliged to escape in their night-shirts, but not a single accident occurred. The building is insured, as well as the Principal's property, the more valuable part of which is saved; but the library of the college, containing many works of great value and a curious collection of Bibles from the time of Coverdale in upwards of fifty different languages, many unique MSS. relating to Manx ecclesiastical affairs, and the valuable military models and plans, maps, mathematical and other instruments, many of which cannot be replaced without much labour and expense, were destroyed. A meeting of the Lieutenant-Governor, the Bishop and others of the trustees, together with the Rev. R. Dixon, Principal of the College, was held on the 15th to consult on the steps to be taken in consequence of the fire. It was resolved that rooms be procured to carry on the usual studies, that an investigation be entered into to endeavour to discover the cause of the fire, and that instant measures be pursued for the restoration of the college on a more efficient and secure plan.

Kirkdale.—On Saturday John Roberts who was convicted at the late Liverpool special commission of the wilful murder of Richard Kenyon one of the gamekeepers of the Earl of Derby at Knowsley suffered the extreme penalty of the law at the north-east angle of Kirkdale gaol.

Leeds.—A letter addressed by the Rev. Dr. Hook, vicar of this town, to his parishioners has just been published. It contains a scheme relative to the ecclesiastical superintendence of the town which involves the sacrifice on the part of Dr. Hook of half his income and the whole of the patronage which he now enjoys. The whole town of Leeds is at present one parish and one vicarage. There are however 21 district churches or chapels of ease, the ministers to which are appointed by the vicar of the parish. Dr. Hook announces that he has been in communication with Government and the ecclesiastical commissioners on the subject of making all these districts separate parishes, and the clergymen of them independent vicars, responsible only to the same ecclesiastical authorities as the vicar of the Mother Church, and receiving all fees and emoluments within their new parishes. A bill is to be brought into Parliament in the ensuing session to effect this arrangement. The patronage of the new parishes is proposed to be vested in the Bishop of the diocese and the ecclesiastical commissioners. Dr. Hook, in consequence of his relinquishment of income, proposes to give up his present residence and to go with his family to a smaller one near the parish church, which was lately rebuilt with great magnificence by the contributions of the parishioners. It is a main object in this new plan to free the floors of all the Leeds churches and leave them open to the occupation of the poor, while the galleries alone are to contain pews for those who desire to have exclusive seats.

Leicester.—Mr. Messenger, the farmer of Gaddesby, who was some time since charged with the murder of James Garner, his servant, but against whom a true bill was not found, has been re-apprehended; several suspicious circumstances having come to light, which lead to the belief that he is not altogether guiltless. A private examination took place on Friday and Saturday, and was then adjourned to Wednesday. A reward of 300*l.* has been offered for the apprehension and conviction of the criminal; 200*l.* of the reward has been raised by subscription by the magistrates and gentry of the county, and the remaining 100*l.* is offered by Government.

Lichfield.—A report copied from a provincial contemporary is going the round of the papers, stating that Dr. Wynter, the Vice-Chancellor of Oxford, had been fixed upon by Sir R. Peel to fill the vacant see of Lichfield, but that Mr. Gladstone having objected to that selection, Sir R. Peel transferred his patronage to the Archbishop of Canterbury who conferred the honour upon Dr. Lonsdale. The *Standard* states that they "mention the report only to give it a flat contradiction, for there is not a syllable of truth in it from beginning to end."

Liverpool.—In consequence of the preparations now making for converting Wallasey Pool into docks, the Corporation on Thursday week put up for sale fifteen lots of land, comprising 605,467 yards, situated on the banks of the pool. The reserved price, however, was in many instances more than four times the amount of the biddings, and no sale was effected.

Manchester.—The General Meeting of the League took place on Thursday at the Free-Trade Hall and was numerously attended. Mr. G. Gibson, Chairman of the Council, presided, and adverted to the large sums received since they last met in that Hall. Within the last five weeks they had held meetings in 25 places, at which the following sums were collected:—Macclesfield, 1400*l.*; Todmorton, 611*l.*; Warrington, 340*l.*; Wigan, (since increased to 600*l.*, double the amount of last year) 44[illegible]; Accrington, 200*l.*; Bury, (since considerably increased) 1120*l.*; Oldham, (since considerably increased) [illegible]; Bacup, (in addition to 1100*l.* given at Manchester) 24[illegible]; Burnley, 1000*l.*; Bolton, (in addition to 700*l.* at Manchester) 505*l.*; Ashton, (in addition to 3840*l.* previously collected) 540*l.*; Bradford, 2000*l.*; Barnsley, 2[illegible]; Pudsey, 200*l.*; Otley, 100*l.*; Hebden Bridge, (which will reach 500*l.*) 402*l.*; Nottingham, (which will be much increased) 500*l.*; Leicester, 800*l.*; Derby, (since increased to near 1200*l.*) 965*l.*; Glasgow, upwards of 3000*l.*; Edinburgh, 1200*l.* The deputation had also attended meetings at Perth, Dundee (where 450*l.* was collected), Leith, Greenock, Dumfries, Cupar, Ayr, Forfar, Jedburgh, Selkirk, and Kilmarnock. Many of these meetings were presided over by landholders, whose property it was said would be materially injured by the repeal of the Corn-laws, and at some of these meetings the largest subscriptions had been raised. Since they last assembled in that Hall 25 meetings had been held, at which 22,988*l.* had been collected towards the Great League Fund. In addition to that amount the Marquess of Westminster had subscribed 500*l.*, making a total of 22,588*l.*; and his Lordship's name was now on that roll of supporters of the League where they found the names of Lords Fitzwilliam, Ducie, Kinnaird, Radnor, and Spencer. Mr. Brotherton, Mr. Milner Gibson, and Mr. M. Philips afterwards addressed the meeting in favour of free trade.

Maidstone.—A numerous meeting took place in this town on Thursday for the purpose of forming an Association among the Agriculturists of West Kent to oppose the League. On the motion of Lord Strangford, Sir E. C. Dering presided. The meeting was addressed by Mr. Knowles, a tenant-farmer, Col. Austen, Capt. Montgomery, Mr. C. Wood, Mr. Elvey, Mr. Douglas, M.P., Mr. E. Filwer, Mr. Berens, and other landowners, and resolutions were passed forming an Agricultural Protection Society, and appointing Col. Austen treasurer. Upwards of 600*l.* were subscribed in the room.

Newcastle.—A meeting was held in this town on Monday to promote free-trade and hear a deputation from the Anti-Corn-law League. The Music Hall capable containing 1000 individuals was completely filled. The Mayor, Sir John Fife, took the chair; Colonel Thompson, Mr. Cobden and others addressed the meeting, and the sum of 461*l.* 16*s.* was subscribed in favour of the League Fund.—On Tuesday night, Mr. George Lowe, assistant tithe-commissioner, was apprehended by the police of this town on a criminal charge, and was locked up in a cell at the Manors police-office for safe custody until the meeting of the magistrates, but in the morning after five o'clock James Carter, a turnkey, reported to the sub-inspector on duty that his charge was missing. It was subsequently discovered that he had left Newcastle by the five o'clock coach for Darlington, twenty minutes before the turnkey reported his absence. Two inspectors were despatched in pursuit of the fugitive in different directions, but no intelligence has been received of him. Carter the police-constable out of whose custody Lowe escaped was brought up before the magistrates on Tuesday, when the evidence against him was gone into, the charge of having wilfully permitted the prisoner to escape, and he was committed for trial for the offence.

Northampton.—A meeting of the Northamptonshire Farming and Grazing Society was held on Saturday, J. Hillyard, Esq., in the chair, to consider the resignation of the patron, Earl Spencer, whose speech in favour of free trade had given offence to about 30 members, and had led to their withdrawal from the Society. The following resolutions were adopted unanimously:—"That this meeting deeply regrets the withdrawal of its noble and generous patron Earl Spencer. That convinced of the great utility of the Northamptonshire Farming and Grazing Society and of the benefit it has conferred upon the agriculture of the county, this meeting regrets the resignation of any of its members, but pledges itself to support the society by every means in its power. That the only objects of this society shall continue to be as hitherto, those for which it was established, viz., the improvement of agri-

JAN. 27,]

... its branches, and the encouragement of skill, ... and good conduct in servants and labourers in ... That this meeting is more than ever convinced ... the necessity of adhering to both the spirit and ... our second rule, which is: "No question shall be ... at the meetings of this society of a political ... which shall refer to any measure to be ... forward or pending in either house of Parliament." On Monday one of the largest county meetings ... Northamptonshire took place in this town, ... the purpose of opposing the progress of the Anti-Corn-law League. About 1800 tenant-farmers were present, and the meeting was attended by the four members for the county, by Lord Southampton, and by a large number of landowners and magistrates. Mr. Manning of Liverpole, presided. Resolutions were passed denouncing the League as a dangerous and unconstitutional system of agitation, and declaring "that the time has at length arrived when it has become indispensable to the welfare and ... existence of agriculture as well as of the numerous ... artificers, and tradesmen connected with agriculture and the home labour market to form a defensive ... on the plain and intelligible basis of protection to ... and native industry." A subscription was ... and upwards of 1000*l.* was collected. The ... Buccleugh, whom the *Morning Chronicle* announced a few days since as having joined the League, ... the list with a donation of 100*l.*, at the same time ... as steward to give a distinct denial to the statement that he was favourable to free trade in corn.

Oxford.—The Rev. Mr. M'Mullen has announced to the Vice-Chancellor that it is not his intention to proceed with the appeal against the decision of the delegates in favour of Dr. Hampden, Regius Professor. The suit is thus terminated.—Intelligence has been received in Oxford of the conversion of another member of Exeter College, Mr. T. Harper King to the Roman Catholic faith, making the tenth Member of the University who has conformed within the last three years. Mr. King some time since made a donation of an organ to Mr. Newman's chapel at Littlemore.

Prestwood.—On the morning of Saturday week the gamekeepers and watchers of J. H. H. Foley, Esq., while on duty at Lawnswood, near Prestwood, had an affray with poachers in the grounds belonging to that gentlemen, and after a desperate struggle succeeded in capturing two of the poachers. The keeper sustained some serious injuries and the poachers were also much punished.

Plymouth.—On Monday-week a meeting was held in this town, the Bishop of Exeter in the chair, in behalf of the Plymouth District Associations of the National Society, the Society for building Churches, and the Society for the employment of additional Curates in populous places. The bishop made a remarkable speech on the rights of the poor, suggested, he said, by the adoption of pews in the parish churches to the exclusion of the poorer classes who could not pay for seats. "This," said his Lordship, "is a most enormous injustice which attaches to every one of those whom I now address. I observe that you all attend seats, and that you pay for them. Now I do not blame you on this account, but whether you pay money for yourselves, you are careless whether the poor have seats or no. You do not pay for the poor, but you do pay for excluding them. As Bishop I say that this wrong shall be redressed. I will not come to this place year after year and see the house of God shut from the poor. You have no right to pews, your churchwardens have no right to raise funds from those pews. Yesterday I had the pleasure of attending that parish church, the great ornament of Plymouth. That structure was raised in the reign of Edward the Third, when these days there must have been a high sense of Christian demands. How many churches have been built since that time? Only one, and that in the reign of George the First. Now what had since been done in the way of providing churches? Nothing—for he scorned to take into the account the two proprietory chapels which had been built for the accommodation of the rich. There was not a Christian congregation in the town—there was not a congregation where the rich amongst the poor bent the knee to God. You have absolutely robbed the poor. You allow the poor to cram in the aisles as they can—but you rob them of that which is their right. They have as much right as you have to accommodation in your parish church, and no churchwarden has a right to appropriate pews to any classes whatever whilst the poor are unprovided. Even in church it is desirable that we should humble ourselves—at church we might learn a salutary lesson when we were taught that however high we stood in this world we should one day be humbled with the lowest. But you have no right to divert any part of the church to the exclusive occupation of the rich until sufficient space has been provided for all. When that is done then you may assign accommodation for the rich; but when it is done pews must not exist. I am speaking in the presence of some whose profession is the law, and I know that they will bear me out that I am not overstating the rights of the poor. You have escaped the question of church rates, and you have thought fit to rob the poor. A church rate is a common law-charge—I will not call it a tax—on your property. But the people of Plymouth say that the poor shall pay for this." He then spoke of the deficiency of education in the district. In a population of 26,000 there was only one national school—only one school in which the children of the lower orders were brought up in the principles of the Establishment. This was another evil which must be redressed—there must be a fund formed to supply the enormous deficiency of education. There were permanent evils to be redressed, and societies ought to be formed by which permanent funds might be raised for such objects.

Romford.—A meeting of the Essex Agricultural Protection Society was held in this town on Wednesday, Mr. R. Baker in the chair, supported by a large body of Agriculturists. Several gentlemen addressed the meeting at great length, and it was unanimously resolved "That the resolutions agreed to at the General Meeting at Chelmsford on the 22d ult. be adopted by this Meeting; that one or more persons in each parish and place in the hundreds of Waltham, Ongar, Becontree, Chafford, and Barnstaple, and the liberty of Havering, be requested to co-operate with the central committee in obtaining names and subscriptions; and that a speech delivered by Mr. Oswald Copeland, a tenant-farmer, at this Meeting be printed for general distribution by the Society."

Spalding.—A meeting of the agriculturists of this district of Lincolnshire was held in this town on Tuesday, Mr. Everard of Fulney in the chair, supported by about 300 agriculturists. Resolutions were passed pledging the meeting to oppose the League as an unconstitutional conspiracy, to make every effort for the maintenance of sufficient protection to British produce, and "not only not to give their support to any Government or party which shall either directly or indirectly attempt to deprive the agricultural classes of any portion of the protection afforded by the present Corn Laws, but by every constitutional means to oppose any proposed diminution of such protection." A letter to Lord Spencer calling upon his Lordship to resign the Presidency of the Royal Agricultural Society, and a petition to Parliament in favour of the objects of the meeting, were then agreed to.

Stroud.—On Tuesday the Stroud Anti-Corn-law Association held a meeting at which 2,000 persons are said to have been present. Earl Ducie was to have filled the chair, but was prevented by indisposition, and his place was supplied by Mr. G. P. Scrope, one of the members for the borough. Mr. Sherriff, a practical farmer, expressed his disapprobation of the Corn-laws. Mr. Fox made a speech in which he alluded to the Farmers' Counter League as so many admissions and approvals of the principles of the League system. Several other gentlemen addressed the meeting, and resolutions were unanimously adopted expressing confidence in the League and a determination to carry out its objects, and at the conclusion of the meeting subscriptions were handed in as contributions to the "100,000*l.* fund," and were received by the assembly with tumultuous applause; among them were Earl Ducie, 100*l.*; Mr. G. P. Scrope, M.P., 50*l.*; Mr. N. S. Murling, 50*l.*; Mr. S. S. Murling, 50*l.*; Mr. C. Stanton, 40*l.*, and others, amounting altogether to 550*l.* The total subscribed last year was only 274*l.*

Tynemouth.—Serious differences have taken place between the vicar and his parishioners on the subject of tractarian innovations in the performance of divine service. The parishioners allege that they have been irritated by 26 changes which have been made in the church service; that they have frequently expostulated with the incumbent, and have besought him to return to the simple manner of performing the service to which they had so long been accustomed, and to which they had become devotedly attached. But all their efforts had proved unsuccessful. A new church is forthwith to be erected by subscription, a sum of 400*l.* having been already raised for that purpose.

Waltham.—A meeting of Leicestershire farmers was held in the Agricultural Hall in this town on Monday, to devise measures to check the progress of the League. The chair was taken by Mr. Norton, of Elton Manor, who remarking on the absence of the leading gentlemen in the neighbourhood said that it was to be accounted for by the unwillingness they felt to influence their tenants in the matter. Mr. Fletcher, agent to the Duke of Rutland, declared that to be the reason why his Grace was not present at the meeting. Letters of excuse were read from Lord Charles Manners, Mr. Turnor, M.P., the Hon. Stuart Wortley, and the Hon. Mr. Wilson, who expressed their disapprobation of the course pursued by the League, and their best wishes for the success of the plan to be adopted by the meeting. Resolutions were then passed, condemning the League, and pledging the meeting to raise its share of any sum that may be necessary to carry out a general system of opposition to its movements.

Warwick.—On Wednesday, a meeting of the landed proprietors, tenants, farmers, and others interested in Agriculture was held in this city, to consider the propriety of establishing a Protection Society. Lord Brooke having been called to the chair, it was found necessary, in consequence of the crowded state of the room and the number of persons who were unable to obtain admission to adjourn from the hotel to the county hall. The meeting was ultimately held in the Nisi Prius Court, which was very much crowded. Among those present were Mr. Shirley, M.P., Mr. B. Greville, Sir C. Douglas, M.P., Mr. Newdigate, M.P., Sir J. Mordaunt, Bart., M.P., &c. Resolutions were passed opposing a repeal of the Corn-laws and denouncing the proceedings of the League as dangerous to the peace and prosperity of the country, and as having ulterior mischievous objects in view. In the course of the proceedings Sir J. Mordaunt read a letter from Lord Willoughby de Broke contradicting in the most positive terms the statement of a local paper that he had joined the League.

Windsor.—A private rehearsal of sacred music, the composition of Prince Albert, took place in the Queen's private chapel before her Majesty and his Royal Highness on Friday last under the superintendence of Dr. Elvey, who presided at the organ. The whole of the choir of St. George's Chapel were present to take part in the performance. The Prince having given his permission to Dr. Elvey to introduce his Royal Highness's compositions in the service at the chapel of St. George, they formed a portion of the musical service at the chapel on Sunday morning.

York.—On Saturday Joseph Dobson was executed behind the Castle of this city for the wilful murder of his father, by shooting him at Mount Tabor, near Halifax, on the 4th July last. The circumstances of the occurrence were fully reported in this Paper at the time and in the subsequent account of his trial before Mr. Justice Maule.

Railways.—The following are the returns for the past week:—Birmingham and Derby, 1,291*l.*; Birmingham and Gloucester, 1,686*l.*; Eastern Counties, 3,347*l.*; Edinburgh and Glasgow, 1,822*l.*; Great Western, 11,582*l.*; Grand Junction, 6,322*l.*; Glasgow, Paisley, and Ayr, 1,083*l.*; Great North of England, 1,267*l.*; London and Birmingham, 13,740*l.*; South Western, 4,781*l.*; Blackwall, 611*l.*; Greenwich, 667*l.*; Brighton, 2,791*l.*; Croydon, 198*l.*; Liverpool and Manchester, 4,108*l.*; Manchester, Leeds, and Hull, associated, 5,157*l.*; Midland Counties, 2,252*l.*; Manchester and Birmingham, 2,604*l.*; North Midland, 3,723*l.*; Newcastle and Carlisle, 1,097*l.*; South Eastern and Dover, 2,307*l.*; Sheffield and Manchester, 480*l.*; York and North Midland, 1,272.—A deputation from the Chester and Holyhead Railway Company, accompanied by directors of the London and Birmingham, and Grand Junction Companies had an interview recently with Sir R. Peel, the Chancellor of the Exchequer, and Sir J. Graham, on the subject of a proposal made by them to Government to give them some assistance in establishing a Railway from Chester to Holyhead. No arrangement, however, with regard to this important undertaking appears to have been made. It was considered on the part of Government that any such arrangement would at present be premature, as there had been scarcely time for drawing public attention to the reports of the naval officers employed by the Admiralty and that of Mr. Walker, the engineer, and for giving to parties generally who might be induced to undertake the construction of a Railway communication from Chester to Holyhead the opportunity of submitting to Government any proposals they might have to offer. The immediate question for consideration was understood to be, whether Government would for a given term of years engage to pay any, and what, sum, for the conveyance of the mail by this new Railway beyond the ordinary charges of conveyance.

IRELAND.

THE STATE PROSECUTIONS. — *Fifth Day.* — The examination of Mr. Charles Ross, a Government reporter, which had been commenced shortly before the close of the Court on Thursday, was resumed on Friday morning. The witness read from his notes an account of a meeting held at the Corn-Exchange on 28th August, at which Mr. O'Connell brought forward a plan for the restoration of the Irish Parliament, and was proceeding also to read a report of a meeting held at the same place on the following day, when Mr. Henn, Q.C., took the objection on behalf of the traversers, that as the witness admitted he had taken a full and *verbatim* note only of those parts of Mr. O'Connell's speech which he thought material, and merely the substance of the other parts, the notes could not be read in evidence. The Solicitor-General and Mr. Serjeant Warren for the Crown contended for the admissibility of the evidence, and the Court overruled the objection. The witness then deposed to having attended various meetings at the Corn-Exchange in the months of September and October, the monster meeting at Loughrea on the 10th September, and one at Clifden on the 17th of the same month, and read from his notes an account of the proceedings, the substance of which was stated by the Attorney-General in his opening speech. On the 27th September a meeting took place at the Corn-Exchange, when the scheme for the formation of the arbitration courts was finally settled, and several persons were appointed to offices under it. At that meeting witness was present, and took a note of the proceedings, which he now read to the Court. Dr. Gray subsequently gave him a copy of the rules which had been framed for the regulation of the courts. He also attended the meeting at Mullaghmast, and took a note of Mr. O'Connell's speech, the substance of which was stated by the Attorney-General, and also given in evidence by Mr. Hughes. This witness was subjected to a very severe cross-examination by Mr. Henn. He admitted that up to that time he had received from Government 400*l.* for the reports he had furnished. Mr. Henn then asked him by whose direction he came? but Mr. Serjeant Warren objected to the question, and cited the case of "Hardy, Tooke, and others," in which it was ruled that no witness who attended a meeting on the part of the Crown was compelled to state the channel through which he received a direction to attend. The Court considered the objection valid, and the question was therefore withdrawn. The witness, however, stated, that previous to his coming to Ireland he had a communication from a person high in office on the subject. The several meetings that he attended were peaceable and orderly, and at none of them was there any tendency to a breach of the peace. The Court adjourned at the close of his examination.

Sixth Day.—At the sitting of the Court on Saturday morning Mr. John Jackson, another Government reporter, was examined. He stated that he was the Irish correspondent of the *Morning Herald*, and he was produced with a view to the identification of the several traversers, the issue of certain documents from the Corn Exchange, of various reports of speeches at the Repeal Association, and particularly the plans for the restoration of the Irish parliament and the establishment of the arbitration courts.

On his cross-examination he stated that all the reports and documents forwarded by him to the *Morning Herald* had been sent back for the purposes of the prosecution. He also stated that he had received instructions from the late proprietor of that journal to place himself in communication with Mr. Kemmis, the Crown solicitor. He admitted that he had been in the habit of embellishing his reports, that he did not write short-hand, that he generally copied his reports from the notes of other reporters or cut them out from the morning papers published the next day after the meeting. At the close of the cross-examination of this witness, Counsel on the part of the traversers applied to have his evidence altogether expunged, as upon his own showing he was a totally incompetent witness. The Court conceived the matter well deserving of consideration, but the present was not the time to argue it. At the close he distinctly and emphatically repudiated the insinuation that he came forward in this case as a volunteer, or otherwise than upon due compulsion of law. Mr. Moore applied for copies of speeches which had been read by the Crown witnesses, being their own reports of these documents. The Attorney-General refused to accede to this request, and the Court declined to interfere.—Mr. John Brown, the printer of the Repeal Association, was then examined by Mr. Moore for the Crown, and deposed to having printed various documents for the Repeal Association, and for which he had been paid by Mr. Ray. Amongst the papers so printed were "Rules of the Committee for Considering the Constitution of the Irish Parliament," "Instructions for the Appointment of Repeal Wardens," "Address of the Association to the Inhabitants of Countries subject to the British Crown," &c. They were all printed in the course of the present year, but he could not state the particular time. The document headed "Instructions for the Appointment of Repeal Wardens" was produced and about to be read by the Clerk of the Crown, upon which Mr. M'Donough, one of the counsel for the traversers, contended that these documents could not be received because they were not included in the bill of particulars supplied by the Crown to the traversers. The Attorney-General argued that in a case of conspiracy there was no necessity to state in the bill of particulars the evidence on which the prosecution relied. After hearing Mr. Moore, Q C, for the traversers, and the Solicitor-General for the Crown on the same point, the Court gave their decision for the admissibility of the documents. One of the counsel for the traversers then intimated that it was their intention to take a bill of exceptions to the decision of the Court, and that there were authorities to show that this course could be adopted in a case of misdemeanour. Mr. Justice Crampton observed that "it would be difficult to persuade the Court to entertain a bill of exceptions in a case of misdemeanour." Another argument arose respecting the admission of a second document, a letter describing the new cards of members of the Repeal Association, by the author of the "Green Book." The Court holding that a similar principle was involved in this question ruled in favour of the admission of the document.

Seventh Day.—On Monday, at the opening of the Court, the Chief-Justice announced that Mr. Justice Burton was ill and could not attend. The Counsel for the traversers then demanded an adjournment on the ground that the Court was incomplete and that the trials therefore could not proceed. However the three Judges who were present decided that the objection was bad. The first business which occupied the sitting was the reading of a paper by the Clerk of the Crown, which was put in and proved on Saturday. It was entitled "Plan for the renewed action of the Irish Parliament." It related to the number of representatives to be assigned to each town or electoral district. Several other papers which had been previously authenticated were read. One of them was entitled "Rules to be observed by Arbitrators," a paper which contained very minute directions for the construction of arbitration courts—how to regulate their proceedings and carry them on without violating the law. This made part of the report of a committee which was directed to take this subject into its special consideration. There was a recommendation made in the association that any member who refused to submit to the jurisdiction of the arbitrators should be expelled, but Mr. O'Connell observed to the Court that this proposal had never been adopted. Copies of some of the summonses and other forms to be used in the courts of arbitration were produced and read, together with one of the placards issued for calling upon the people to attend the meeting at Mullaghmast. It called upon the "men of Leinster" to remember that rallying place, and pointed out where the "bands" and "cavalry" were to assemble. The examination of the witnesses for the Crown was then resumed. Mr. Thomas Packer, a lithographic artist, proved the printing in the establishment of Mr. Holbrook, a printer in Dublin, of the various cards for the admission to the meetings of the Association of the members, associates, and volunteers, and also that he had made various alterations in the designs of the cards at the suggestion of Mr. Ray. On his cross-examination he stated that Mr. Holbrook was printer to the Government, and that Government business was being executed at his premises at the same time that the Repeal cards were in course of preparation. Several persons proved the delivery of the cards at the Repeal Association Hall.—Mr. J. Click M'Namara was then examined, and stated that he was not a professional reporter, but was employed by Captain Despard, the stipendiary magistrate, to attend the meeting at Tullamore, in July last to report the proceedings. At that meeting Mr. O'Connell, Mr. Steele, and Mr. J. O'Connell were present. The witness was about to read from his notes, when the Attorney-General rose and said he observed that two of the traversers were absent; he understood that they had left to attend a Repeal meeting at the Conciliation Hall, and unless they attended in court he must insist on their recognizances being estreated. The two absentees (Mr. O'Connell and Mr. Steele) were sent for, and within a few minutes appeared in court. The witness then read from his notes an account of the meeting, and stated that he saw banners and placards with the inscriptions, "See the conquering Hero comes;" "Ireland, her Parliament again—or the world in a blaze." The placards were posted on the walls of the town.—John Simpson Stuart a sub-inspector of police, deposed to having been present at the Tullamore meeting. There was an arch over the street on which was written "The slave-master may brandish his whip, but we are determined to be free;" "Beware! Physical force is a dangerous experiment;" "Repeal shall not be put down by bayonets." On another arch was written, "Ireland, her Parliament, or the world in a blaze;" "Ireland shall not be a serf nation;" "God save the Queen," and other inscriptions. A great number of persons went in procession with bands. There was also a large body of horsemen who came in sections of four. The evidence of the last witness as to the meeting having taken place was substantiated by that of Mr. Neil Brown, a stipendiary magistrate residing at Tullamore, who also stated that there was no riot at the meeting, nor any disturbance in the town until late in the evening. He believed that all the bands which attended were temperance bands. A head-constable named Johnson gave evidence as to the meeting at Longford on the 29th May, and the display of various banners with similar inscriptions to those at Tullamore. He also read notes of the speech made by Mr. O'Connell, in which he said he should not be content while a single Riband Society existed in Ireland; that if the people were peaceable Ireland should have a parliament again; and that they were then to go home, and when he wanted them again he would let them know. There were about 40,000 persons present. On his cross-examination he stated that the people came into the town shouting and leaping and brandishing their sticks. They were in a "rage of excitement." He saw several men on horseback who appeared to be priests, but he could not say that they had sticks in their hands. He was ordered on duty in plain clothes, for the police did not dare to show their faces.

Eighth Day.—On Tuesday the first witness was John Maguire, a head constable of police. He was examined by Mr. Bennett, and gave evidence as to the Longford monster gathering. His testimony was much the same as that of Johnson, the other constable, who was examined the evening before. They had been both sent from Sligo by their superior officer to attend the meeting in plain clothes to observe what took place. The witness deposed that he saw the bands and marching of many in rank and file order, and heard Mr. O'Connell's speech on the platform, and the expression of his hope to the people that they would come to him again when he wanted them, with numerous other matters, which however had been all given in evidence on a former day. The witness was cross-examined by Mr. Hatchell amidst a great deal of merriment. The questions put were intended to show that the witness had no very exact knowledge of what he supposed to be "marching in military order." The next witness was Mr. John Jolly, a head constable of police attached to the Cork district. His evidence had reference to the great Mallow demonstration made on the 11th of June last. He saw the procession pass, and never saw so many people together in his life before. They were marshalled by leaders and preceded by bands. He heard Mr. O'Connell's speech, and remembered a few passages of it—the first of which was that he (Mr. O'Connell) had come to tell the people a secret, and that there was enough of them there to be able to keep it; the secret was, that the Union should be repealed by a certain date, which this witness could not recollect. Ireland, he said, must be for the Irish, for they were too numerous, too temperate, and too determined, to have it any longer kept from them. The House of Commons was an assembly of "bribers"—Sugden was the man with an ugly name, and the Lord-Lieutenant was so ignorant that he sent a commission to Kilkenny to ascertain if it was not a sea-port. They had sent the soldiers to shoot them; but if attacked they would defend themselves. The serjeants in the army were the best men in the service or in the world, but they were the worst treated. In the French army it was otherwise; there they were promoted to the rank of commissioned officers in due course. When the Union was repealed all this would be altered; then every labourer would become a farmer, every farmer a gentleman, and every gentleman a lord. The witness further said that Mr. O'Connell asked the people would they come again if he wanted them, and if so, that they should raise up their hands. "A wood of hands," as the witness said, "was then immediately raised up." Mr. Whiteside cross-examined this witness with great humour and at immense length. The Court was for some time convulsed with laughter. Another witness was then called named Henry Godby, a policeman, who gave some additional information touching the Repeal meeting at Baltinglass. When the people were shouting for O'Connell he heard one of them say, "These shouts are frightening the pigeons;" "Ay," said another, "and the Protestants too." Several other police-constables were called to give evidence as to the same meeting, and were cross-examined at great length. Witnesses were now examined touching the meeting at Monaghan and the Rev. Mr. Tierney. The witnesses were all policemen. One swore to a private conversation with the traverser, in which it would seem that the Rev. Gentleman endeavoured to make the constable a convert to Repeal, intimating to him that the army was now possessed with the same enthusiasm as the people, and would join in securing the required separation. Another constable named Thompson gave an account of the Clontibret meeting, of which Capt. Seaver was the Chairman, and of the Chairman's speech, wherein he asked the people if they had all got Repeal cards? "I have a reason for asking you," said he; "other societies have signs and passwords, but I know no better way for you to recognise each other than by producing Repeal cards." Mr. O'Neill Daunt spoke at this meeting and said, You shall have this land my friends if you are worthy of it—and who dare say that you are not? Look for any other object and you have a series of battles to fight, but look for Repeal and you have all summed up in one. We are here to-day to tell John Bull that Ireland shall be free for she deserves her liberty. The witness was cross-examined at some length by Mr. Henn. There was a pause of some minutes after the examination of this witness; and the Chief Justice desired a gentleman named Samuel Maunsell of 42, Leeson-street, to be called by the crier. His Lordship explained to the court that he had been handed a letter written by this gentleman and addressed to the High Sheriff, which called for the immediate interposition of the Court. What was the purport of it was not stated, but it was understood to contain a challenge of a very offensive character. It was ordered that Mr. Maunsell should attend at the sitting of the court next morning. A constable named Walker was next called, who gave evidence respecting the "Tara of the Kings" meeting. He was succeeded by Capt. Despard, resident magistrate of the county of Meath, who gave a detailed account of the same meeting. He said he was an old military man, and that the numbers collected at Tara amounted on the very lowest calculation to 100,000. Witnesses were then examined respecting the meeting at Clifden in Connemara, but the "demonstration" was, with a few slight modifications arising out of local circumstances, nearly the same as in all. The proceedings then terminated for the day and at five o'clock the court adjourned.

Ninth Day.—On Wednesday the Court again sat without Judge Burton who was still suffering from illness. The first witness was James Heley a sub-constable who stated that according to his calculation there were 250,000 persons at the Mullaghmast meeting. He described the proceedings of the assembly, and identified a paper sold amongst the crowd and which was of a most inflammatory character, it was entitled "A History of the great Massacre at Mullaghmast." One of the inscriptions on the flags used on this occasion was "Mullaghmast and its Martyrs, or a voice from the grave." The witness was cross-examined by Mr. M'Donagh and admitted that the assembly met and separated *peaceably* and that there was neither riot, drunkenness, nor disturbance during any part of the meeting. The Clerk of the Crown was next called upon to read the paper entitled "A History of the Massacre of Mullaghmast," proved by the witness; but this was objected to by the traversers' counsel who contended that the publication ought not to be considered as among their "responsibilities." It was not printed by any printer employed by them; it was sold by hawkers among the multitude as a ballad or any other mere speculation of their own, and they maintained that there was no evidence to connect them with it. The Court however overruled this objection after argument and said that it should be treated as any other part of the transactions. The Clerk of the Crown then read this "full and true account of the dreadful slaughter of 400 Catholics who were basely and treacherously slaughtered by Saxon tyrants," &c. The next evidence offered for the Crown was her Majesty's speech at the close of last session, or so much of it as deprecated the Repeal agitation in Ireland. To the reading of this also, Counsel for the defence raised an objection; but it was overruled, and that passage was read wherein her Majesty declared that "she observed with deep concern the efforts that were being made to excite disaffection among her subjects in Ireland, her sincere conviction that the Union was no less necessary for the welfare of the whole kingdom than it was for Ireland, and that she felt assured that her loyal subjects in that country would use their exertions to discourage to the utmost of their power the system of pernicious agitation which existed there." James Irwin a police constable of Liverpool was called to prove that copies of the address from the Repeal Association to the subjects of the British empire in every part of the world, had been posted in various parts of that town. The next witnesses were Messrs. Vernon and Cooper, two gentlemen holding situations in the Stamp Office, who were called to authenticate various copies of the *Nation*, *Freeman's Journal*, and *Pilot* newspapers. Mr. Cooper could not recognise the person of Mr. Duffy and was unacquainted with his handwriting, and hereupon another long law argument ensued. The Court however ruled that the Act of Parliament relating to the subject was sufficiently complied with. The reading of extracts from the papers then commenced. The first article was one from the *Nation*, entitled the "Morality of War;" but which the Attorney-General in his opening statement and again on this occasion, said might be more properly designated the morality of "rebellion." This appeared in the *Nation* of the 10th June. Traversers' counsel required that a speech of Mr. O'Connell's published in the same number of the paper should also be read, and no objection was made on the part of the Crown; but subsequently a very long discussion arose on two points: first, whether the traversers were at liberty to require any part they please of the contents of the paper or any other document produced by the Crown to be given in evidence; and 2dly, if so, whether the evidence so adduced was to be considered

that of the prosecution or of the defence. The Court pronounced a qualified judgment on both points, but one with which the Crown Counsel seemed content. Some further newspaper articles were about to be given in evidence, but it being now five o'clock the Court deferred the reception of them till morning. As the Court was about to rise, Mr. Maunsell, the gentleman who had addressed an offensive letter to the High Sheriff, presented himself, and apologies were mutually exchanged which seemed to give satisfaction to all parties.

Tenth Day.—On Thursday the documentary evidence occupied the Court and Jury, and most lengthened were the extracts from the *Freeman's Journal*, the *Nation* and *Pilot* newspapers. Some contained the speeches of Mr. O'Connell and others of the traversers, and the remaining extracts contained editorial comments. Mr. Vernon produced files of the several papers which were required. The deputy clerk of the Crown read the article headed "The Crisis is upon us," appearing in the *Nation* of the 26th of August. Also "The Irish Congress," an article expressing delight at the assemblage of 300 men to act as a national council like the American Congress, when asserting their independence. The Attorney-General objected to the traversers' counsel reading, in the present stage of the case, portions of the same newspaper having no bearing on the documents given in evidence by the Crown. Mr. Hatchell, Q.C., expressed surprise at the objection, as he had understood the Crown had assented to the arrangement that all the articles in the same paper should be read consecutively: first, for the Crown, secondly, for the traversers. The Chief Justice observed that the Court did conceive there had been an arrangement to dispose of one paper before going to another, although certainly at that time it was not understood that the traversers' extracts would have been of such length and of so unconnected a nature. Judge Crampton hoped that the traversers would not abuse the arrangement by reading matter which was irrelevant. The Solicitor-General observed that the Crown were quite disposed to accede to any suggestion of the Court, and the objection had been made by the Attorney-General in order to enable the case for the prosecution to close sooner. The officer then read for the traversers' counsel the correspondence between Mr. Henry Sugden and Sir Valentine Blake, on the latter being superseded as a magistrate. The Crown then had read an article in the *Pilot* of the 7th of June, headed "Repeal—Ireland—the great Drogheda Demonstration," giving an account of the meeting held there, and of the dinner. The traversers gave in evidence the petition of the Drogheda meeting to Parliament for a repeal of the Legislative Union. For the Crown was read the "Kilkenny Banquet" in the *Pilot* of the 12th June. Mr. M'Donough said that he did not mean to delay the Court by having read the whole of the speech made by Mr. O'Connell, but the whole could be entered as evidence for the traversers. Extracts were stated to the jury on behalf of the traversers, in order to show that the healths of the Queen and Prince Albert were drunk with enthusiasm. The proceedings at the meeting at Mallow were given in evidence, and the remarkable speech of Mr. O'Connell at the banquet, where he hurled his haughty defiance at the Saxon, and lamented the day that the Saxon "polluted the virgin soil of Ireland with his cursed foot." Mr. M'Donough required an extract to be read from the speech of Mr. Roche, M.P., at the meeting where he spoke of the tranquillity of the meeting. Mr. Vernon read an account from the *Freeman's Journal* of the 7th August, of the meeting at Baltinglass, in the county of Wicklow. The numbers present were stated at 150,000, and as having come from six counties. The speech of Mr. O'Connell on that occasion contained his statement respecting Lord Wicklow, that one pig was worth ten Lord Wicklows, because the pig could be eaten, and that so much good could not be got out of his lordship, and that Lord Portarlington's ancestor had come to Wicklow in the capacity of hangman to the Army. The Crown then had read, by the officer, the account of the Tara meeting as contained in the *Pilot* newspaper of the 16th August. The paper stated that upwards of one million persons attended the meeting from various places in Ulster, Munster, and Connaught, as well as from Leinster; and the brave men who came from Wexford stopped to shed a tear over the grave where lay buried the men who had fallen at Tara in 1798. The speeches of Mr. O'Connell at the dinner and at the banquet were read by the Deputy Clerk of the Crown, together with Dr. Gray's address, and the *Pilot* of the 15th May, containing a report of the Mullingar meeting, &c.

Dublin.—The weekly meeting of the Repeal Association was held on Monday; Mr. Smith O'Brien occupied the chair for the first time since his accession to the Repeal movement. He stated that he had come there to offer himself as another victim, if necessary, to the Attorney-General, and said that though the leaders of the people were under prosecution, still the verdict of the jury that had been empannelled to try them would under existing circumstances be destitute of all moral weight by the admission of the entire empire. He concluded by impressing strongly on the association the necessity of conciliating their Protestant fellow-countrymen who had not yet joined them, and promised his hearty co-operation in forwarding the cause in which they were embarked. Mr. O'Connell, who attended the meeting for about twenty minutes, briefly addressed the association, and brought forward two propositions for their consideration. One was the establishment of Catholic societies in every town throughout Ireland, to be continued until the Roman Catholics were put upon a perfect equality with their fellow-subjects of other persuasions in regard to the privilege of trial by jury, and the second was a suggestion to the Liberal constituencies throughout Ireland to call upon their representatives to absent themselves from Parliament during the ensuing session, and to confine their exertions exclusively to the advancement of the Repeal career in Ireland. Mr. Powell, M.P., Mr. J. O'Connell, and other gentlemen also addressed the association. The Repeal rent for the week was announced to be 396*l.* 19*s.* 7*d.*—The corporation have received an answer from the Secretary of State acknowledging the receipt of the address to the Throne, praying that her Majesty will be graciously pleased to grant an act of amnesty to Mr. O'Connell and the other gentlemen now on their trial before the Court of Queen's Bench on charges of sedition and conspiracy, and stating that on the return of her Majesty to London a day will be appointed for the reception of the deputation of which due notice shall be given.

Rathfarnham.—On Sunday week, an elderly woman, who was the housekeeper of the Rev. Mr. Roche at the Chapel House of Rathfarnham was murdered in the kitchen during the absence of her master. It appears that the murderer had robbed the house and cut the throat of the servant with a knife which was found in the coal-cellar. The jury returned a verdict of Wilful Murder against some person or persons unknown.

SCOTLAND.

Glasgow.—A public meeting of the Roman Catholics of Scotland was held on Monday week in this city, and was attended by nearly 5000 persons, Bishop Murdock in the chair. The following resolutions were agreed to:—"That the conduct of the Dublin Crown law-officers in striking off the special jury list the eleven Catholics who were fairly drawn by ballot was an act of injustice to the Catholics on trial, to the whole body of the Irish Catholics and to the traversers, and that it was tantamount to a partial repeal of the Emancipation Act. That the said conduct of the Dublin Crown law-officers is a gross insult offered to the Irish people in particular, six-sevenths of whom are Catholics, and to all Catholics in general, in as far as it insinuated the base calumny that Catholics disregarded the sanctity and obligation of an oath, when they had a purpose to serve. That in order to proclaim to the world our sense of the insult offered to our body, and this our public protest against the injustice perpetrated against religious liberty, the resolutions passed at this meeting be published in one or more of the Irish, English, and Scotch newspapers."

Haddington.—On Friday last a meeting called by Lord Elcho, as Vice-Lieutenant of the county, was held at Haddington for the purpose of considering what course could be adopted for securing due protection to agriculture. The meeting which was numerously attended was composed of the noblemen, gentlemen, commissioners of supply, justices of the peace, and tenant-farmers of the county of Haddington, and amongst those present were Lord Elcho, the Earl of Lauderdale, Sir T. B. Hepburn, Sir D. Kinloch, Major-General Sir R. Houston, Mr. Balfour, M.P., Hon. F. Charteris, M.P., &c. Lord Elcho was called to the chair, when resolutions in opposition to free trade and in favour of an Agricultural Protection Society were unanimously adopted.

Roxburgh.—A meeting in favour of the League Fund took place in a dissenting chapel in Hawick on the 20th inst., where from 1,500 to 2,000 persons were present. The Earl of Buchan occupied the chair; and the first speaker was John Ord, Esq., of Muirhouselaw, who jointly with his brother rents lands in Roxburghshire at several thousands of yearly rent. Mr. Ord stated that last year he was opposed to a repeal of the Corn-laws and now he was in favour of a repeal. The deputation from the League, consisting of Mr. Cobden and Mr. Moore, afterwards addressed the meeting at great length in favour of free trade.

Cupar.—Messrs. Cobden and Moore were presented with the freedom of the burgh of Cupar, Fife, on Thursday last, and afterwards addressed a numerous assembly of the inhabitants at a public meeting on the subject of free trade in corn, at which Provost Nicol presided. A subscription in aid of the League fund of 100,000*l.* was commenced at the meeting.

Law.

VICE-CHANCELLOR'S COURT.—(Before the Vice-Chancellor of England.)—*Lord John Beresford* v. *Archbishop of Armagh.*—There were two points in this case. The late Marchioness of Waterford was tenant for life, to her separate use, of the Four Castle estate, in Northumberland. During the late Marquess's life the rents had been regularly transmitted to his account at Hoare's bank, and at his death there stood a balance of 11,000*l.* to his account. After his death the late Marchioness, who alone proved his will, directed the balance to be transferred to his executors' account, and died shortly after. The first question was whether the estate of the Marchioness, which was represented by Lady Ingestre, was entitled to the 11,000*l.*, or whether it belonged to the estate of the Marquess for the benefit of his younger children. His Honour thought it was as plain as a thing could be that the Marchioness had agreed to give the Marquess complete and absolute dominion over the rents; and that the balance of 11,000*l.* belonged to the Marquess's estate. It was nothing extraordinary that such a large balance should have been left at the bankers, as every man knew in passing through life, that it was of great importance to noblemen and gentlemen of large fortune to have a large balance at their bankers to meet any sudden emergency. The second and more important question was respecting the claim of the personal estate of the late Marquess to be recouped a sum of 63,000*l.* with interest, which the late Marquess had advanced in payment of incumbrances on his real estates in Ireland, of which he was tenant for life. His Honour briefly delivered judgment. The question was whether on the will of Marquess George, and the deed executed by Marquess Henry, in 1822, Marquess Henry was originally bound or had placed himself under an obligation to apply the surplus rents of the estates, after paying the current charges for interest, in liquidation of the capital of the incumbrances which Marquess George had created. His Honour was clearly of opinion that the will amounted to nothing more than a charge of debts and legacies in the simplest form, and although the deed contained some foolish and blundering words, which were utterly inconsistent with the plain intention of the parties, had a bill been filed for executing the trusts of the deed, the Court would not have given it the construction which had been contended for on the part of the counsel of the Marquess; and it would no doubt be a surprise and lamentable calamity on the noble family concerned if any other mode of dealing with the property than that of keeping the charges alive for the benefit of the younger children were allowed. His Honour decreed therefore that the personal estate was entitled to the benefit of the incumbrances which the late Marquess had paid. The result of this decision is to add a sum of above 90,000*l.* to the personal estate of the late Marquess, which is divisible for the benefit of his younger children.

COURT OF EXCHEQUER.—(Sittings in Banco.)—*Hart* v. *Winser.*—This was an action to recover the rent reserved on the lease of a house in the Wandsworth-road, to which the defendant pleaded that the house was so much infested with bugs that it was found uninhabitable by the defendant and his family, and that immediately after ascertaining the fact the defendant had removed. There were also pleas denying the making the lease, and setting up as a defence that the defendant was induced to enter into the covenant upon fraudulent misrepresentations. The case was tried during the last sittings before Baron Rolfe, and the Jury found the first plea in favour of the defendant, the nuisance appearing to be of the most intolerable description. The issues on the other pleas were found for the plaintiff under the learned Baron's direction, and the question of law reserved for the Court. Mr. Addison now moved for a rule to show cause why the verdict should not be entered for the plaintiff instead of the defendant on the first plea, on the ground that it was not sustainable in point of law. It was true that in the case of *Smith* v. *Marrables* this Court had decided that a party was not bound to pay for a ready-furnished house intended for immediate occupation, if upon entering it was found to be so infested with bugs that it was unfit for the habitation of a family. But this was a different case. The house was unfurnished, and it did not appear from anything on the face of the pleadings that it was intended for immediate occupation. The defendant may have taken it with an intention to take means to get rid of the nuisance, and have had the house at a lower rent in consequence. The Court granted a rule to show cause.

COURT OF COMMON PLEAS.—*Woods* v. *The Duke of Argyll and Sir James Cockburn.*—This action was tried before the Lord Chief Justice and a Special Jury at the Middlesex sittings after last term, and was brought to recover 37*l.* 6*s.*, being the amount of the plaintiff's bill for furnishing a copy of Kunard's Map of Prince Edward's Island for the British American Association of which the Duke of Argyll was the president and Sir James Cockburn one of the consulting council. The society was originally called "The British and Scottish Emigration Association," but it subsequently assumed the name under which it has been several times before the public. It was proposed to send out emigrants from Scotland in the first instance to America and afterwards to Prince Edward's Island, and an executive committee was formed to manage the transactions of the society. The Duke of Argyll was appointed the president and Sir James Cockburn one of the consulting council, and they agreed to become shareholders in the undertaking when 50,000 shares were disposed of at 20*l.* per share. The secretary of the association employed the plaintiff to make the map. The association was subsequently broken up before the 50,000 shares were got rid of. The defendants denied their liability, and it was contended on their behalf that as the undertaking was to be one of charity and not of profit that as the undertaking was to be one of charity and not of profit they had merely lent their names in the same way as Royalty or the nobility might become patrons or presidents of any charitable institution. The Jury found a verdict for the defendants.—Mr. Sergeant Byles now applied for a rule to show cause why the verdict should not be set aside, and a new trial had on the ground of misdirection and the misreception of evidence, contending that the defendants were liable inasmuch as they had held themselves out to the world as connected with this association and would have been entitled to share in any profits that had resulted from the early emigration measures of the association. The Lord Chief Justice was of opinion that everything had been brought forward at the trial which could by possibility be made to bear upon the case. Three points had been left to the Jury—first, whether the defendants had themselves entered into a contract with the plaintiff? secondly, whether they were co-contractors? and thirdly, whether they had held themselves out to the world as responsible for the acts of the executive committee or intervening association? The prospectus clearly showed they held out a different paymaster than themselves—namely, the executive committee which was to have the management of the whole concern. He thought therefore that the Jury were justified in arriving at the conclusion that the verdict should not be disturbed.—The other Judges concurred.—Rule refused.

Gregory v. *the Duke of Brunswick and Another.*—This was an action brought to recover damages for the injury which the plaintiff had sustained by an alleged conspiracy on the part of the defendants and others to drive him from the stage, and ruin him in his profession of an actor. The cause was tried before Lord Chief Justice Tindal at the Middlesex sittings after last Trinity Term. The Jury found for the defendants, and in the course of last term a rule *nisi* was obtained for a new trial, upon the ground that the verdict was against evidence. Mr. Serjeant Talfourd now showed cause against this rule, contending that the verdict ought to stand, inasmuch as the conduct deposed to by the witnesses who were called merely showed that the defendants had taken a part in the disturbance which ensued upon Mr. Gregory's appearance, but not that the disturbance was the result of any conspiracy. If there had been a conspiracy a reaction would have followed, and Mr. Gregory would have had justice done to him by the public; but the truth was that the tumult which arose was the spontaneous expression of public feeling, and knowing this Mr. Gregory had not dared to present himself again on the stage as a candidate for popular applause. Mr. Serjeant Shee in support of the rule contended that the evidence disclosed matter sufficient to show that a conspiracy had been formed by the defendants, previously to Mr. Gregory's appearance as *Hamlet*, to hiss him from the stage. The Jury, however, hurried away by the whirlwind of prejudice which had been let loose upon the case, found a verdict for the defendants, and he submitted that there was ample ground for a new trial. The Court took time to consider, and gave judgment on Thursday. The Lord Chief Justice said that the Court had given the case very great attention, and being perfectly satisfied that the main charge, and that which was the main point before the jury, had been properly decided; they felt they ought not to grant a new trial for the purpose of letting in a subordinate charge—namely that of a general conspiracy, not limited to the two defendants, but extending to the whole house, and which had not been kept from the consideration of the jury, unless they were perfectly satisfied that the verdict on that point also was wrong. They were not so satisfied; and they wished to add further, that as the charge of conspiracy against the defendants was a very serious charge, the Court ought not to interfere unless they felt that the course of justice had failed. They thought, therefore, that the rule *nisi* for a new trial ought to be discharged. Rule discharged accordingly.

ARCHES COURT.—*The Office of the Judge promoted by Burder against Langley.*—This case was a proceeding against the Rev. R. H. Langley, perpetual curate of Wheatley, Oxon, for chiding and brawling in his parish church. This Court, on the 27th June, 1842, held the charge to be proved, and sentenced Mr. Langley to suspension for eight months from the day of the publication of the sentence in the church of the perpetual curacy, where it was published on the 3d of July. Mr. Langley gave notice of appeal to the Judicial Committee of the Privy Council, but the inhibition did not issue till the 20th November, 1842, upon which he resumed his clerical functions, which he had not exercised since the publication of the sentence. The Judicial Committee affirmed the sentence, and remitted the cause to this

Court, and the question now was, whether the computation of the eight months was to begin *de novo* from the time when the sentence was affirmed (or from the first day of this term), or whether the period of actual suspension or cessation from duty intervening between the publication of the sentence and the inhibition, should be reckoned as part of the eight months. Dr. Phillimore on behalf of the promoter, contended that the object of the suspension was that it should be continuous, and that, as it had been interrupted by the party's own act, it should begin *de novo*. Sir H. Jenner Fust (without hearing Mr. Langley who appeared in person, was of opinion that he had no authority to alter his sentence, which he had directed should be computed from a certain time; that the present application was premature for the question would properly be raised when Mr. Langley thought fit to resume his clerical duties, when if he attempted to do so before the legal period of suspension had elapsed, he might be proceeded against for contempt.

MIDDLESEX SESSIONS.—*John Bruce, James Gray, John Hancock, Charles Pitcher, John Burt*, and *Francis Chapman*, were indicted for illegally keeping and maintaining a common gaming-house at a tobacconist's shop in King-street, St. James's. Mr. Ryland in opening the case observed that this was a special case and a day had been appointed for taking it. Every endeavour had been made on the part of the defendants to remove the case from the jurisdiction of this Court for the purpose of defeating the ends of justice, but such attempts had been frustrated, and it was necessary for the interests of society that such houses as the defendants were accused of participating in the profits of should be suppressed. Mr. John Kelly of Northampton-place Old Kent-road and a merchant of Leadenhall and Borough markets, was the prosecutor in this case, who was a sporting man and had been made the victim of in the present instance. The learned counsel here detailed the circumstances as they afterwards appeared in evidence and said he should be able to show that the premises No. 11 King-street St. James's were opened as a tobacconist's in order to decoy parties, who were defrauded by the defendants into upper rooms, and that on several occasions the whole gaming apparatus was removed by order of the defendants to Epsom races, Barnet fair, and other places, where they could pursue with success their illegal and ruinous practices. Mr. Kelly was then called and deposed to the main facts of the case. Other witnesses proved that the defendants were in the habit of visiting the house from time to time and that there was a door leading to the upper rooms which were barred and fastened for the purpose of preventing persons gaining entrance thereto unless sanctioned by the defendant Hancock, who carried on the business of a poulterer elsewhere and performed the duties of shopman at the tobacconist's shop. It was also shown that Bruce rented and paid the rates of the house up to the last two months, when the name of the tenant was substituted for that of Horne. A number of policemen proved that the defendants were in the habit of going to the house, and that certain Marquises, Earls, and other noblemen frequented it, whose names did not transpire. The Jury returned a verdict of Guilty against Bruce, Chapman, Pitcher, and Hancock, and of Acquittal for Gray and Burt. The Chairman sentenced Bruce to pay a fine of 100*l*., and to be imprisoned and kept to hard labour in the House of Correction for six months; Hancock to pay a fine of 50*l*. and six months' imprisonment; Chapman to pay a fine of 50*l*. and four months' imprisonment; and Pitcher to pay a fine of 50*l*., and to suffer four months' imprisonment—each, in addition, to be kept to hard labour. The Council for the prisoners then moved an arrest of Judgment on the ground that the indictment did not aver and set forth the parish and place where the house in question was situate. The Chairman, Mr. Serjeant Adams, said he would consult the Judges on the point. On Monday he announced that he had consulted the superior Courts, and the Judges were of opinion that the objection raised to the validity of the indictment was not tenable. If, after this intimation, the parties felt that they could gain any advantage by adopting such a course, they had the power of applying to the Attorney-General for a writ of error. The defendants now, therefore, would at once, with the other persons in the prison, be put to hard labour. The Solicitor for the defendants afterwards applied to the Court to suspend judgment, and to admit his clients to bail, on the ground of their intention to apply for a writ of error. Any amount of bail the Court might think proper to name should be forthcoming. The Chairman said he could not suspend the judgment of the Court, and the sentence should be strictly enforced. The Solicitor said he should immediately wait upon the Secretary of State, and endeavour to obtain redress.

POLICE.—MANSION HOUSE.—*The Wills Forgeries.*—On Monday and yesterday the prisoners in custody, viz., *W. H. Barber* the Attorney, *Joshua Fletcher*, and *Mrs. Dorey*, were brought up for re-examination. Mr Clarkson stated that the inquiries which had been instituted for the purposes of forwarding the ends of justice had enabled the prosecutors to bring forward a fourth charge against Barber and the unfortunate woman at the bar as principals, and against Fletcher as an accessary both before and after the fact, of having procured a person to personate the sister of John Stuart, deceased, for the purpose of feloniously obtaining certain sums standing in his name in the Bank of England. It appeared that in 1826 there was standing in the books of the Bank a sum of 51*l*. Long Annuities, in the name of John Stuart. Nothing was heard of Stuart until 1840, and in 1836 the sum in question had been transferred to the Commissioners for reducing the National Debt. Stuart, it appeared, had died in 1827, at Great Marlow, in Buckinghamshire, where he had lived for some years before in the service of Mr. Strode of that place, as steward and gardener. Mr. Strode had defrayed the funeral expenses of Stuart, and out of respect to him had caused a tablet to be erected to his memory in the parish church of Great Marlow. A grave-stone had likewise been erected over his grave. Nothing had been heard of any representative of Stuart, or of any property of his until May, 1840, when the prisoner Fletcher went down to Great Marlow, to the house of a person named Hyatt, who kept an inn there, and made inquiries of Hyatt as to the relatives of Stuart. Hyatt, who had only recenly come to Marlow, took Fletcher to several old persons who recollected Stuart, and who gave him information. Fletcher before he went away told Hyatt that his name was Jones, and that he had come down by order of Government to make inquiries as to Stuart, and he requested Hyatt, if he procured any additional information, to forward the same to him, addressed to Mr. R. Jones, 24, Little Guilford-street, Russell-square. About a month afterwards Barber went to Marlow to make inquiries about Stuart. He asked if Mr. Jones had been there, and stated that they were partners in the same concern. He stated himself to be Clarence Packham, Esq., 52, Nelson-square; and told Hyatt if he came to town he should be glad to see him to dinner. Hyatt came to town shortly afterwards, and called at Nelson square where he saw Barber, who however instead of asking him to dinner, seemed most anxious to get rid of him. On the 25th June, Hyatt received a letter from Fletcher signed in the name of Jones, and dated 24, Little Guilford-street. It stated that the writer desired Hyatt should make further inquiries on the subject of Stuart, on the understanding that he should be paid for his trouble. The writer stated he wished to ascertain where Stuart had lived before he came to Mr. Strode, and also what place in Scotland he had come from; facts which he stated could be ascertained from an old fellow-servant of Stuart's. The letter then concluded as follows:—"I have been able to ascertain that 12 years' since, Stuart had a sister residing in America, and if you will take an early opportunity of making these inquiries you will greatly oblige your obedient servant, G. Jones. Please to direct to me, Mr. G. Jones, Miss Hawkes, 24, Little Guilford-street, Russell-square." This was the preparation for introducing the supposed sister on the scene. It would appear that Miss Hawkes was a personal friend of the female prisoner, who had applied to her to permit certain letters which she expected on business in the month of June, to be addressed to Little Guilford-street. Mrs. Dorey, who was then Miss Richards, at that time kept a stall in the Pantheon for the sale of china, and resided with her mother in Rathbone-place. In June, 1840, the stall was given up, and they left Rathbone-place, and no account could be obtained as to their place of residence until November following. In July, 1840, Fletcher took lodgings at 1, Southampton-terrace, Camberwell, for an old lady named Elizabeth Stuart, and there was every reason to believe that the supposed Elizabeth Stuart was the mother of the female prisoner. Mrs. Dorey frequently visited the supposed Elizabeth Stuart, as did Fletcher, his wife and daughter. She remained there three months, during the whole of which time she appeared to be labouring under great anxiety and depression of spirits. In June, 1840, a woman between 40 and 50 years of age went to the office of Mr. Pott, a proctor carrying on business in Godliman-street, Doctors'-commons. She was accompanied by some one else, and stated that she wished to procure letters of administration to the personal estate of her brother, John Stuart, deceased. He asked who had recommended her, and she said Mr. Fletcher. Mr. Pott knew a gentleman named Fletcher, but was unacquainted with the prisoner; and believing it to be that Mr. Fletcher, he took the transaction into his office. Finding that on account of the length of time which had elapsed the registrar was likely to oppose the granting of letters of administration, an affidavit was made by Elizabeth Stuart and Thomas Griffin. The affidavit of Elizabeth Stuart, of 4, Duke-street, Grosvenor-square, was read. It set forth that Elizabeth Stuart had in 1836 met her with John at the Bank of England, when he informed her that he had invested certain moneys in the stocks, but he did not state what; that at his decease Stuart had left a chest in the care of the Vicar of Marlow, to whom application had been made, and who stated that he had never heard anything of any will; that at the last interview the deceased had told her that he intended to sell his property and go and join her in America; that she had gone to America expecting him to follow, but that she had never seen or heard anything from him, although she had written frequently to him, and that on her return to England in May, 1840, she had first received information of her brother's decease from a friend of her aunt, a gentleman named Jones, who had come over from New York with her, and had gone down to Great Marlow to make inquiries, when he learned that he had died in 1827, and had left property to the amount of 700*l*. The affidavit of Griffin corroborated the account given by Elizabeth Stuart of the last interview between her brother and herself. On the 28th August, 1840, letters of administration were applied for, and the application was accompanied by affidavits of the marriage of Robert and Janet Stuart, at Callender, in 1756; of the baptism of John the son of Robert and Jane Stuart, born in 1761; and of Elizabeth Stuart, the daughter of Robert and Jane Stuart. There was a discrepancy between Janet and Jane, which as no suspicion was excited at the Prerogative-office, did not attract attention. These documents had been engrossed in Pott's office; and it is presumed that they had been prepared by Barber, who had gone to Marlow in the June preceding. These certificates had been prepared most adroitly. Immediately after this, Barber had gone to the Bank accompanied by a woman apparently about forty years of age, who therefore could not possibly have been the deceased, supposed, as she must have been, upwards of eighty. Mr. Barber was identified by a gentleman named Hill, and the woman received 700*l*. back dividends. The stock was then sold out by Mr. Hill, who gave a cheque on Sir John Lubbock for the amount, which cheque was immediately changed into gold; and so quickly had this been done that when Mr. Hill sent to have a small error corrected almost immediately afterwards, he discovered that the cheque had been changed for gold. Witnesses were called to prove these facts, and the man Griffin who had been apprehended put in a statement that he had been requested by the old woman, the supposed mother of the female prisoner, to sign the affidavit, and had been paid for his trouble. The four prisoners were then again remanded.

LAMBETH-STREET.—Nehemiah Shakspeare, late an engineer in the employment of Mr. Johnston, cigar manufacturer of Gloucester-street, Commercial-road East, who was admitted to bail a fortnight since, on a charge of having wilfully and maliciously caused the explosion of a steam-boiler, by which the lives of upwards of seventy individuals were placed in jeopardy, has been fully acquitted of the criminal charge; and with regard to the alleged negligence in allowing the boiler to explode, numerous witnesses proved that the boiler was defective, and that no attention could have prevented the accident.

SPORTING.

TATTERSALL'S, THURSDAY.—DERBY.—13 to 2 agst Mr. John Day's The Ugly Buck (taken 7 to 1); 18 to 1 agst Mr. Lichtwald's Leander (taken to 200*l*.); 25 to 1 agst Mr. A. Wood's Running Rein (taken to 25*l*. and afterwards offered); 25 to 1 agst Mr. Bowes's T' Auld Squire; 40 to 1 agst Mr. Watt's Voltri (taken to 10*l*.); 45 to 1 agst Sir G. Heathcote's Campanero (taken to 30*l*.); 1000 to 20 agst Mr. Thornhill's Apprentice (taken); 1000 to 15 agst Mr. J. Osborne's Mount Charles (taken); 1000 to 15 agst Lord W. Powlett's Nell Gwynne colt (taken); 2000 to 20 agst Mr. Sadler's Johnny Broome (taken).

BIRTHS.—On the 12th inst., in Chester, the lady of H. RAIKES, Esq., of a daughter.—15th inst., at Stockland, Bristol, Somerset, the lady of C. G. PRIDEAUX, Esq., of Lincoln's Inn, of a daughter.—16th inst., at the Vicarage, Egham, Surrey, the lady of the Rev. W. H. BIRDSAMANN, of a son, still-born.—20th inst., at Newport, Devon, the Hon. Mrs. BUTLER, of a son.—20th inst., at No. 12, Belgrave-st., the lady CAROLINE TURNOR, of a daughter.—20th inst., at Castle Coole, Ireland, the COUNTESS OF BELMORE, of a daughter.—22d inst., at Upper Tulse Hill, Brixton, the lady of C. B. REELE, Esq., of a son.—22d inst., the Hon. Mrs. SHAW, of a son.—22d inst., at Leytonstone, Essex, the lady of E. N. BUXTON, Esq., of a son.—23d inst., the lady of W. ROLLINGS, Esq., of Upper Tooting, of a daughter.—23d inst., in Golden-sq., the wife of J. MAPLESON, Esq., of a son.—A few days ago, at the Rectory, Elton, Hunts, the wife of the Rev. T. M. SYMONDS, Rector of Adwick-le-Street, near Doncaster, of a daughter.—Lately, at Stratford upon-Avon, the lady of T. W. WESTON, of New Hall, of a daughter.

MARRIED.—On the 5th August, 1843, at the Protestant Church, Valparaiso, Her Majesty's Consul, J. C. SEARLE, Esq., to JOSEPHINE ROSARIO BUNSTER, eldest daughter of Grosvenor Bunster, Esq., Lieutenant, Royal Navy.—11th inst., at Dartmouth, E. HENLEY, Esq., to ANN, daughter of the late Rev. T. Mends, vicar of Holbeton, Devon.—13th inst., at Chippenham, W. KEMM, Esq., of Corsham, to SARAH FRANCES, youngest daughter of H. Goldney, Esq., of Chippenham.—16th inst., at Cockermouth, W. M'LEAN, Esq., Greenock, to JANE, daughter of the late J. Henderson, Esq., of Shap, Westmorland.—16th inst., at Lymm, W. A. UNWIN, only son of J. Unwin, Esq., of the island of Madeira, to ELIZABETH, second daughter of the Rev. John Blythe, of Whitehaven.—16th inst., at Ingatestone-hall, Essex, BERNARD JOHN LAST, Esq., of Portland-terrace, St. John's-wood, London, to HARRIET JOHANNA HAVERS, third daughter of the late Thomas Havers, Esq., of Thelton-hall, Norfolk.—17th inst., at St. Luke's, Norwood, the Rev. J. TREVITT, to MARY, daughter of Mr. R. Simpson.—18th inst., at Llanrhos, Carnarvonshire, Mr. J. E. EVANS, of New Bond-street, London, youngest son of the late Mr. R. Evans, to MARGARET ELIZABETH, eldest daughter of the late Mr. Jones, Whitford, Flintshire.

DIED.—6th inst., at Perth, JAS. HOSACK, Esq., M.D., late Surgeon to H.M.'s Forces.—9th inst., at Rome, HARVEY FERGUSON, aged 18, the eldest surviving son of J. Montgomery, Esq., of Benvarden, country of Antrim.—11th inst., at Alphington, near Exeter, the Lady CATHERINE C. PARKER, aged 27.—12th inst., at Aston Hall, Hawarden, Flintshire, aged 3, SOPHIA HARRIET RIGBY, sixth daughter of Capt. T. E. Cole, R.N.—14th inst., at Springvale, near Glasgow, Mr. J. JOHNSTON, Resident Engineer on the Edinburgh and Glasgow Railway.—14th inst., at Haverfordwest, Pembrokeshire, ANNA MARIA, wife of T. B[illegible]ing, Esq., aged 49.—15th inst., at the residence of his uncle, Baron von Seckendorf, Obeonzeun, near Ansbach, CHAS. HENRY VON LANG, M.D., aged 33, eldest son of Dr. Lang, Newman-st.—16th inst., at 22, Warner-st., Dover-road, SEBASTIAN ADOLF, the eldest child of Adolf Heilbronn, Great Tower-st., aged 3 years and 9 months.—16th inst., aged 80, OWEN OWENS, Esq., of Nelson-st., Chorlton-upon-Medlock.—16th inst., at Broughton-hall, Oxon, the Rev. WM. COLSTON, second son of the late E. F. Colston, Esq.—16th inst., MARY, wife of the Rev. J. Tothill, rector of Hi tisleigh, Devon.—16th inst., at his house in Erskine-st., Liverpool, ISAAC HADWEN, Esq., formerly of Gibraltar, aged 66.—17th inst., at Pilgrim's Cottage, Hampstead, Miss ELIZ. FOSTER, aged 61.—17th inst., at Gourock-house, Renfrewshire, MARGARET, relict of the late Charles Stewart Parker, Esq., of Fairlie, aged 70.—17th inst., at Broadway-house, Hammersmith, MARY CLAVEY, second daughter of the late J. Hall, Esq., of the Elms, Derby.—17th inst., at his house, 4, Hyde-park-place west, aged 70, the Rev. HENRY SMITH, second son of the late Dr. Smith, prebendary of Westminster.—17th inst., aged 70, Rev. C. HOBART, M.A., Master of Ledbury Hospital, and Canon Residentiary of Hereford Cathedral.—18th inst., at Vectnor, Isle of Wight, CHARLOTTE ELIZABETH, eldest daughter of Major G. A. Ramsay, of Hill Lodge, Enfield, Middlesex.—19th inst., at Bath, ALICE, wife of J. Whiting, Esq., of 26, Duke-street, Westminster, and Carshalton, Surrey.—19th inst., in Upper Montagu-st., MARY, wife of Sir J. D. King, Bart., of West Wycombe Park, and Halton House, Bucks.—19th inst., at her house, 1, Park-st., Notting-hill, Mrs. HOUSLEY, relict of the late Mr. Housley, of Wakefield, Yorkshire.—19th inst., at Weymouth, aged 84, Mrs. ELIZ. FONBLANQUE.—20th inst., at No. 43, Wood-st., Cheapside; Mr. EDWARD DAVIES, chemist, aged 69.—21st inst., at Muddiford, near Christchurch, Hants, the Hon. CHAS. ROBERT ST. JOHN, youngest son of the late Viscount Bolingbroke.—21st inst., at his house, at Pentonville, FRANCIS HALLER, Esq, late chief clerk to the Lord Mayor for 50 years, aged 80.—23d inst., at his residence in St. James's-place, SIR FRANCIS BURDETT, late M.P. for North Wilts, aged 74.—23d inst., at Llanyblodwel Vicarage, Oswestry, the Rev. J. DONNE, D.D., Vicar of that parish, and late Head Master of Oswestry Grammar School, aged 80.

GAZETTE OF THE WEEK.

BANKRUPTCY ANNULLED.—J. FRANCE, Manchester, cotton-manufacturer.

BANKRUPTS.—F. B. COURTENAY, Great Marlborough-street, bookseller—F. SHAW, London-wall, builder—W. EMMINS, Montpellier-row, Brompton, builder—C. WILLIAMSON, Regent-street, hosier—R. MARYON, Chigwell, Essex, blacksmith—H. CLERVE, Rettendon, Essex, cowkeeper—T. PARR, Liverpool, plumber—J. ROBINSON, Arnold, Nottinghamshire, wharfinger—C. S. JAMES, Leeds, cloth-merchant—R. TEBAY, Cheesehill-st., Winchester, plumber—M. BESWICK, Norwich, wine and porter-merchant—J. ROLFE, Uxbridge, coal-merchant—W. EVANS, Borthwen, Merionethshire, miller—J. RUSHTON, jun., Nottingham, livery-stable keeper—G. MORGAN, Gloucester, currier—J. WILSON, Newcastle-upon-Tyne, draper—J. FOTHERGILL, sen., Selby, Yorkshire, apothecary—H. HITCHIN, Halifax, Yorkshire, ironmonger.

SCOTCH SEQUESTRATIONS.—J. PEARSON, Muirhall by Perth, ex-banker—W. CRAWFORD, Dundee, ironmonger—T. C. SMITH, Edinburgh, insurance broker—J. SMITH, Glasgow, grocer—I. MERCER, Dunse, currier.

WANTED immediately, a steady active Young Man, as a general NURSERY FOREMAN, a good Propagator and Salesman would be indispensable. For particulars apply to Mr. W. WHITE, Nurseryman, Swansea.

WANTED, a young or middle-aged Man, as PROPAGATOR in an Establishment in the neighbourhood of London where nothing but pot plants are grown. He must thoroughly understand his business in all its branches.—Apply, by letter (post paid), to A. B., 19, Milk-street, City, stating where he has lived in that capacity.

WANT PLACES.—All Letters to be post-paid.

TO NOBLEMEN AND GENTLEMEN.

AS GARDENER.—S. SNOW, Gardener to the Earl De Grey, having a single Young Man under him, aged 20, who has served him for three years and upwards, is desirous to obtain for him a Situation as above, having proved him fully competent to undertake a good situation.—Direct to S. SNOW Wrest Park, Silsoe, Beds, where testimonials as to character and abilities will be given.

AS UNDER-GARDENER and FLORIST.—A respectable young Man under an experienced Gardener and Florist, would not object giving a moderate Premium to be instructed in the above line, in all its Branches. For further particulars, direct to W. T. H., Post-office, Sutton, Surrey.

AS FARM BAILIFF, OR BAILIFF & GARDENER.—A middle-aged single Man, who understands his business in all its various improved departments. Can produce an unexceptionable ten years' character.—Address, Secretary, Regent's-park Gardeners' Society for Mutual Instruction, 64, High-street, Marylebone.

AGRICULTURE.

AS ASSISTANT on a Nobleman or Gentleman's Estate.—A Foreigner, aged 30, is desirous of engaging himself as above, or in any other capacity in which he could prove serviceable. He has been engaged for many years in Agriculture in Russia and Prussia, and is possessed of information which would tend to the improvement of British soil. He wishes to gain additional experience in English Agriculture. No salary expected for the first year; speaks four languages; can give references of the highest respectability, and eight years' character from his present employer in the city. Direct to A.B., at Mr. COOPER'S, 22, New Bond-street.

TO LANDED PROPRIETORS.—A young person of the highest respectability is desirous of obtaining a Situation as AGENT to a Nobleman or Landed Proprietor. He has been four years with a gentleman who has extensive estates under his management, and is, therefore well qualified to undertake the duties of such a Situation.—Apply to J. C. M., at the *Gardeners' Chronicle and Agricultural Gazette* Office.

AS STEWARD or STEWARD & GAMEKEEPER.—A married man, about 40 years of age, is desirous of obtaining a Situation as above; has been in the habit of receiving Rents, managing of Farms and Timber, with measurement; is also a good judge of stock, and can be well recommended for honesty and punctuality in accounts.—Direct to A. B., Post-office, Henley, Oxon.

A VACANCY for a MEDICAL APPRENTICE exists at a Public Institution, in one of our largest commercial cities. The advantages afforded are—residence in the family of one of the Medical Officers, with liberty to attend the regular course of study preparatory to examination, and ample opportunities for practice.—Apply at the *Gardeners' Chronicle and Agricultural Gazette* Office.

THE GARDENERS' CHRONICLE AND AGRICULTURAL GAZETTE.

A Stamped Newspaper of Rural Economy and General News.—The Horticultural Part Edited by Professor Lindley.

No. 5.—1844. SATURDAY, FEBRUARY 3. [PRICE 6d.

GEOLOGY.—PROFESSOR WEBSTER, F.G.S., will commence his LECTURES on MONDAY, 5th February. The Course will consist of 30 Lectures, and will be divided into three parts.

1.—The description of such simple minerals as enter essentially into the composition of rocks.

2.—Geology, properly so called, or the characters and superposition of the strata composing the crust of the globe, together with an account of the various phenomena exhibited by them.

3.—The application of the above subjects to the useful arts.

Lectures on Monday, Wednesday, and Friday, at a quarter past 12 o'clock. Fee 3*l*. The course is open to Gentlemen who do not attend any other class in the College.

P. S. CAREY, Dean of the Faculty of Arts and Laws.
CHARLES C. ATKINSON, Secretary to the Council.
University College, London, January 26, 1844.

CAMDEN CLUB, now forming at No. 12, Waterloo-place.—These premises so desirably situate, and expressly fitted up for a Club-house, with all the appointments ready for immediate occupation, have been obtained for the New Club.

TERMS OF ADMISSION.

Town Members' entrance . £10 10 0 Annual . £7 7 0
Country Members' entrance 5 5 0 Annual . 5 5 0

It is proposed to introduce a new principle into the constitution of the Club with regard to Town Members, by which a Member retiring shall have a rateable proportion of his entrance fee returned to him, according to the number of years he may have been a Member.

Prospectus containing full particulars of this new regulation may be had of the Secretary, at No. 12, Waterloo-place, where the Provisional Committee meet daily to receive applications from gentlemen desirous of becoming Members.

London, February 1, 1844.

THE LATE MR. LOUDON.—A Public Meeting of the Friends of the late Mr. LOUDON will be held in the large room of the Horticultural Society's Establishment, Regent-street, London, on Saturday, Feb. 17, at Two o'clock precisely, to consider the best means of extricating his Widow and Daughter from the difficulties into which they are placed by Mr. LOUDON's sudden death.

It is hoped that noblemen and gentlemen who patronise Horticulture, and also all Gardeners and Nurserymen who are within a reasonable distance, will attend.

DEATH OF MR. LOUDON.—The following Subscribers to the Works of the late Mr. LOUDON have been obtained since the publication of the Address in the *Gardeners' Chronicle* of Saturday last.

ORANGE AND LEMON TREES, from 8*s*. to 25*s*. DOUBLE HALIAN TUBEROSE ROOTS, 3*s*. per dozen.—R. HALL begs to advise the arrival of his Annual Importation of the above-named Trees and Bubs, which are this year remarkably fine, at his Foreign Warehouse, 63, South Audley-street, Grosvenor-square—facing the Chapel.

DWARF CHERRIES GRAFTED ON THE PRUNUS MAHALEB, OR PERFUMED CHERRY.

T. RIVERS, JUN., begs to offer the following sorts of CHERRIES, grafted on the above Stock, Root-pruned, and admirably adapted for potting, for forcing, or for forming Dwarf prolific Trees, to be protected by nets, 2*s*. 6*d*. each:—

Arch, or Holman's Duke
May Duke
Royal Duke
Late Duke
Biggareau
Black Eagle
Belle de Choisy
Elton
Early Amber Heart (Rivers's)
Florence
Knight's Early Black
Imperial Morello
Black Tartarian
Tradescant's Black
Waterloo
Werder's Black Heart.

The following Ornamental Standard Trees for Lawns are also offered:—

	each.		each.
	s. *d*.		*s*. *d*.
American Weeping Willow, 8ft.	5 6	Robinia macrophylla, or grandiflora, 6ft.	3 6
*Cytisus elongatus (pendulous), 5ft.	2 6	*Yellow Broom, 5ft.	2 6
*Cytisus purpureus (do.), 5ft	2 6	Double Dwarf Almond, 4ft. to 5ft.	2 6
*Cytisus purpureus, flora alba, 5ft.	3 6	Siberian Almond, 4ft. to 5ft.	2 6
*Cytisus nigricans, 5ft.	3 6	White-flowering Dwarf Almond, 4ft. to 5ft.	2 6
*Cytisus falcatus, 5ft.	2 6	Dble. flowering Peach, 5ft	1 6
*Genista anxantica, 5ft.	3 6	Weeping Laburnum, 6ft	2 6
*White Portugal Broom, 5ft	3 6	Eagle's-claw Maple, 6ft.	1 6
*Double Yellow Broom, 5ft	3 6	Lilac, rubra grandiflora fine plants, 6ft.	2 6
Robinia hi-pida major largest Rose Acacia, 6ft	3 6	Lilac, Charles X., do., 5ft	2 6

Female Plants (the fruit-bearing plants), of the Shepherdia argentea, or Buffalo Berry, recently imported from America, 2*s*. 6*d*. each. "Its fruit, which is much relished in America, is about the size of the Red Currant, much richer to the taste, and forms one continued cluster on every branch and twig."—*London*.

Carriage of all Packages paid to London.

Those marked * are grafted on the Laburnum.

Sawbridgeworth, Jan. 31, 1844.

OLIVER'S "YOUNG HEIR" DAHLIA for 1844, to be sent out the last week in April, at 7*s*. 6*d* each.

E. OLIVER begs respectfully to call the attention of Dahlia-growers to the above Seedling, which gained Prizes at the following places:—Felton open Show, best Seedling, Sept. 27, 1842; also an extra prize, August 31, 1843—nine blooms: Alnwick, August 29, in the first stand of 12; also the premier prize of any colour; also the best Seedling—five blooms. Colour, rosy crimson; the petal, form, and centre first-rate; constant and free bloomer; height, from 3 to 4 feet.

A few ground-roots to dispose of, at 3*l*. each. E. O. has no objection to take one-half of the amount in plants of anything new and good.—Eslington House, Whittingham, Northumberland.

GEO. CROFT, Forbury, Reading, begs to call particular attention to his Seedling Verbena "ADONIS"—a light crimson, with large lemon-coloured eye. This is particularly recommended to Noblemen and Gentlemen's Gardeners for planting out in beds, as nothing can excel in beauty a bed of this splendid Flower. Plants in April. 3*s*. 6*d*.

Likewise to his Seedling Fuchsia "UNIQUE"—tube and sepals smooth; sepals expand well; corolla, rosy purple: the plant is of beautiful habit, and if the Public can judge, then this is one of the loveliest Fuchsias sent out. Plants in April, 7*s*. 6*d*.

DAHLIAS.

J. KEYNES, FLORIST, Salisbury.—"STANDARD OF PERFECTION," (Keynes).—The finest self-coloured Dahlia in the world! gained the 1st class prizes at Stonehenge, Windsor, Kingston, Surrey Zoological Gardens, and Crown and Anchor, Stockwell; also the 1st prize specimens at Stonehenge Floricultural Society, Stockwell. "It is as round as any Dahlia in cultivation; as complete an unbroken circle as could be drawn with the compasses; and as globular in front as possible. It is symmetrical to a hair, and as double as a Ranunculus. It is so remarkable as to be instantly recognised among a thousand. Colour, deep crimson. It is the flower of the season, and must be had."—*Gardeners' Gazette*, Oct. 14. "The best-grown flower we ever saw, without exception, every requisite to meet the taste of a connoisseur being complied with; good colour, a honeycomb, regularity of growth and disposition in the leaves, and above all, as complete a rotundity of shape as if it had been cast in a mould."—*Salisbury Herald*, Sept. 2, 1843. Plants in May, 1844, 10*s*. 6*d*. "Orange Superb," (Dodd's) first-rate show-flower, 10*s*. 6*d*. "The specimen sent would grace any stand."—Glenny. "Emma Noke," (Dowding's) bluish white, extra fine, indispensable to a first rate stand, 10*s*. 6*d*. Catalogues containing all the fine old varieties and new flowers for the season may be had on application.—Salisbury, Jan. 31, 1844.

NEW EARLY POTATO.

HURST AND MCMULLEN beg to inform the Public they have this season purchased of Mr. SODEN, his entire stock of that splendid new Early Potato, *Soden's Early Oxford*. This superior variety has taken the *First* Prize at all the *three Shows at Oxford and other places*, and is allowed to be the earliest and best in cultivation. Sold at 4*s*. per peck, *bag included*. In another column will be found a List of choice Vegetable Seeds.

6, Leadenhall-street, Feb. 1, 1844.

JOHN MILLER, surviving Partner of the late firm of SWEETS and MILLER, Nursery and Seedsmen, Bristol, begs respectfully to inform Nurserymen, the Trade, and his Friends in general, that he has commenced business as Auctioneer and Valuer of Horticultural and Agricultural Stock, &c., and hopes by strict attention to the interest of his employers, to merit their support. Letters addressed to JOHN MILLER, Portland House, Kingsdown, Bristol, will meet with immediate attention.—Bristol, January 31, 1844.

NEW HARDY ANNUAL.

VISCARIA OCULATA—DARK-EYED VISCARIA.

T. AND J. BACKHOUSE, NURSERY AND SEEDSMEN, York, have the pleasure of offering to the Public the above new and beautiful Annual, which is figured at page 53, (No. 10), of the "Botanical Register" for 1843. The blossoms are of a bright rose colour, with a deep crimson eye, and changing to a pale purple. It flowers very abundantly through the greater part of the summer and autumn. It is a native of Algiers and may be sown either in the open ground in spring, or raised in pots and planted out.

Packets, 2*s*. 6*d*. each, will be sent, on the receipt of a Post-office order, postage free, to any part of the Kingdom.

FINE HYBRIDIZED FUCHSIA SEED.

W. MILLER begs to inform his Friends that he has spared no pains in selecting the best kinds of Fuchsia for hybridizing, and now has a few packets of fine seeds to dispose of, in packets containing 100 seeds, 7*s*. 6*d*.; 50 seeds, 4*s*. Fine Verbena seed, in packets at 2*s*. 6*d*. and 5*s*. each, with directions for sowing. W. M.'s extensive list of Fuchsias, Verbenas, Pelargoniums, &c. &c. can be had on application, containing a full description of his new productions, by Dr. LINDLEY, viz.:—Fuchsia "Constellation;" Petunia "Punctata;" Verbenas "Blue Queen" and "Zenxes." W. M. has fine plants of his new "Fire Ball" Geranium, at 5*s*. each. The above will be sent post free to any part of the United Kingdom.—Providence Nursery, Ramsgate, Jan. 31, 1844.

DANE CROFT NURSERY, STOWMARKET, SUFFOLK.

SAMUEL GIRLING, ENGLISH AND FOREIGN DAHLIA AGENT, submits the following choice SEEDLING DAHLIAS to his numerous Friends for 1844, plants of which can be had early in May; they are all faithfully described, and early orders are respectfully solicited, as the stock of some of them is very limited. General Catalogues of DAHLIAS, GERANIUMS, PANSIES, FUCHSIAS, and VERBENAS, can shortly be had, on prepaid application.

BEAUTY OF SUFFOLK (BEAR's).—Bronzy purple, of superior form and excellent habit; a constant and extra second-rate show-flower; seedling prizes at Ipswich and Stowmarket. Height 4 feet.—Price 7*s*. 6*d*.

BERMONDSEY BEE (PROCTOR's).—A crimson purple, of excellent form and fine general habit, well cupped, stiff petals; when well grown one of the best Self Dahlias in cultivation.—4 ft.—10*s*. 6*d*.

MODEL (BOURN's).—Dark purple, of first-rate form; has taken first prizes at the Metropolitan and other shows, and pronounced a first-class flower. 4 ft.—10*s*. 6*d*.

NONPAREIL (PROCTOR's).—Ruby scarlet, of first-rate form, habit excellent, free bloomer, pronounced by the Horticultural Society of London, and at the Slough exhibition, to be a first-class flower. The stock of this beautiful Dahlia is small, and unless it breaks well will be held in another year. No allowance on this variety unless six plants are ordered. Glenny's opinion of this Dahlia is, that well-grown it will be a trimmer. 4 ft.—10*s*. 6*d*.

ORANGE PERFECTION (BOURN's).—Of good form and habit, an extra second-rate show-flower, rather low in the centre, but sometimes well up, when it will beat all the orange class. 4 to 5 ft.—7*s*. 6*d*.

RED ROVER (GIRLING's).—Of good general properties and extra fine habit; colour fine red, and useful for showing. 4 to 5 ft.—7*s*. 6*d*.

TALMA (GIRLING's).—Purplish rose, of superior form and habit, little short of first-rate; rising centre and very constant. 4 ft.—7*s*. 6*d*.

SIR JOHN STEWART RICHARDSON (Union, in which S. G. has a share), which is one of the most popular Dahlias of the season. No allowance on this variety unless 12 plants are ordered. 4 ft.—10*s*. 6*d*.

FANCY DAHLIAS.

CORNELIA (GIRLING's).—Purple, tipped with white; of good habit and very distinct. 4 ft.—5*s*.

GARLAND (GIRLING's).—With three colours—cream, sulphur, and brown tip; of good form and habit. 5 ft.—5*s*.

MADAME MIELLEZ (GIRLING's).—Rose-lilac, tipped or striped with white; a distinct variety, of good habit. 3 to 4 ft.—5*s*.

MADAME DE BERGHE (GIRLING's).—White edged with pink; a distinct and beautiful variety. 3 ft.—5*s*.

MADAME CHAUVIERE (GIRLING's).—Light crimson tipped with pure white; very constant, good shape, and one of the finest border Dahlias in cultivation. 4 ft.—5*s*.

VILLAGE MAID (GIRLING's).—Colours white and purple, distinctly and beautifully tipped; good habit, and superior border variety. 3 to 4 ft.—5*s*.—Stowmarket, Jan. 31, 1844.

BUSHELL'S Light Seedling Dahlia "EMMA."—Plants in May, 10*s*. 6*d*. Colour white, tipped with deep cherry; the petals, form, and centre, good; the largest, most constant, and free in flowering of any Dahlia yet propagated, and has obtained several prizes. "Pet Rival" Plants in May, 5*s*. Colour, purple maroon; fine cupped petal and free bloomer; exhibited in several winning stands last season. Kennington Rose, Plants in May, 5*s*.; most constant Rose grown. To be had of Messrs. ANSELL, Camden Town; S. GIRLING, Stowmarket; F. and A. SMITH, Hackney; and J. BUSHELL, 12, Hall-place, Kennington-lane.

HYACINTHS AND GROWING STOCK.

HUMPHREYS'S COMPOUND, applicable to all Greenhouse Plants, to Hyacinths and other Bulbs, and to promote the germination of Seeds. Sold in bottles 1*s*. 9*d*. each, by FLANAGAN and SON, Mansion-house-street; HURST and MCMULLEN, Leadenhall-street; W. CLARK, Bishopsgate-Without; SMITH, Islington Nursery; GRIMLEY and Co., Covent Garden; BATT and RUTLEY, 412, Strand; WILLIAM and JOHN NOBLE, Fleet-street; SMITH, Covent-garden; CHARLWOOD, Tavistock-row; W. J. NUTTING, 46, Cheapside; G. LAWRENCE, 18, Piccadilly; JOHN KERNAN, Great Russell-street, Covent Garden; LOCKHART, 156, Cheapside; SHUTTLEWORTH, Pantheon; MINIER, ADAMS, and NASH, 63, Strand; THATCHER and SON, Islington; THOMAS ANSELL, Camden Town; THOMAS WATKINSON, Market-place, Manchester; W. E. RENDLE, Plymouth; DICKSON & Co., Edinburgh; PONTEY, Leeds; FISHER, HOLMES, and Co., Sheffield; P. LAWSON and SON, Edinburgh; and other leading SEEDSMEN in town and country. Wholesale Agents, DAVY, MACKMURDO, and Co., 100, Upper-Thames-st., London.

MARNOCK AND MANLEY'S CATALOGUE of NEW AND CHOICE FLOWER-SEEDS, with full and particular Directions for the best Modes of Cultivation, with the Treatise on the Walcheren Cauliflower is now ready, and may be had on application.

Their Stock of trained Fruit-trees are exceedingly fine, consisting of all the leading varieties of Peaches, Nectarines, Apricots, Plums, &c. Also the following Cherries.—Harrison's Heart, Black Heart, Adam's Crown, Waterloo, Knight's Early Black, Florence, Black Eagle, Downton, Late Duke, May Duke, Bigarreau, Elton Napoleon, Early Purple, Circassian, Kentish, Morello of sorts, &c. Prices may be had on application at their Nursery, Hackney, London.—Jan. 31, 1844.

FASTOLFF RASPBERRY.

YOUELL AND Co. have much pleasure in announcing they have now ready for sending to any part of the United Kingdom, fine Canes of the above highly-valuable and much-esteemed RASPBERRY, unequalled for the extraordinary size of its fruit and richness of flavour.

IT IS PATRONISED BY HER MOST GRACIOUS MAJESTY THE QUEEN, THE MOST NOBLE THE MARQUIS OF AILSA, HIS GRACE THE DUKE OF RUTLAND, THE EARL OF HARRINGTON, THE EARL OF LIVERPOOL, THE LORD BISHOP OF LONDON, LORD VISCOUNT LORTON, LORD SONDES, &c. &c.; as well as by the HORTICULTURAL SOCIETY OF LONDON.

For further particulars they beg to refer to their Advertisement of the 27th of January: Prices as follows:—

			£	s.	d.
Packages containing 100 Canes			£2	5s.	0d.
Do.	do.	50 do.	1	5	0
Do.	do.	25 do.	0	14	0

Package included.

The usual discount to the Trade, when not less than 200 are ordered.

*** CAUTION.—Y. and Co. beg to call the attention of their Friends and the Public in general to the fact that they have appointed no Agents in London for the sale of the above, and cannot be held responsible for its being genuine, unless purchased direct from their Nursery.

YOUELL'S TOBOLSK RHUBARB, Patronised by Her Most Gracious MAJESTY the QUEEN, and many of the Nobility, 12s. per dozen.—For particulars of which see their Advertisement of the 18th November.

TWO NEW SEEDLING PICOTEES.—"LADY ALICE PEEL," 10s. 6d., and "MRS. BENYON," 10s. 6d. per pair.—These two splendid Picotees were raised by the Rev. J. Burroughes, of Lingwood Lodge, Norfolk, and kindly presented by that gentleman to Messrs. YOUELL and Co. For particulars of which see their Advertisement in this Paper of the 15th of Sept.

FINEST CARNATIONS AND PICOTEES.

YOUELL AND CO. beg to refer the readers of the *Gardeners' Chronicle* to their Extensive List, with Prices, of the above highly-esteemed Flowers, which appeared on the Advertising pages, 706 and 707, of this Paper, of October the 14th, and will be found to contain every variety worthy of cultivation.

Prices as follows:—

	£	s.	d.
12 pair of good Show Sorts	1	4	0
12 ditto fine ditto	1	10	0
25 ditto ditto	3	0	0
12 ditto extra fine and very superior ditto	2	10	0
25 ditto ditto ditto	5	0	0

The selection being left to YOUELL and Co.

FUCHSIAS.

1 dozen of the newest and very best sorts	21s.
1 dozen fine ditto	12s.
1 dozen good show varieties	8s.

Sent by post, free, to any part of the United Kingdom.

ARAUCARIA IMBRICATA.

YOUELL AND CO., possessing the most extensive stock in the country of the above Splendid Hardy Ornamental Tree, beg to offer them on the following advantageous terms:—Fine robust 4-year-old plants, 8 to 9 inches high, 10*l.* per 100, or 30s. per dozen.—Great Yarmouth Nursery, Feb. 1, 1844.

FUCHSIA SEED.

YOUELL AND CO. beg to inform their Friends and the Public they have succeeded in saving a small quantity of the above from the very newest and best varieties, which they offer upon the following terms:—

A packet containing	100 seeds	10s
Do. do.	50 do.	6s.

Sent post free on the receipt of a Post-office order. Directions for sowing, &c. will accompany each packet.

This will form an admirable opportunity to those who intend competing for Seedling Prizes at the exhibitions of the present year. The quantities being very limited, early application will be necessary.—Great Yarmouth Nursery, Feb. 1, 1844.

GAINES'S NEW AND FIRST-RATE PELARGONIUMS now ready for delivery in strong, healthy Plants. The following are a few selected:—Gaines's Elegans nova, King of Beauties, Ackbar, Lady Prudhoe, Saxon King, Excelsa, Beauty Supreme, Mogul, Edith, Countess of Zetland, Cotherstone, Egbert. A list of Pelargoniums, Pansies, Calceolarias, Fuchsias, Verbenas, Auriculas, Cinerarias, Chrysanthemums, Dahlias, &c., which contains many new Seedlings of first-rate qualities; plants in May, 10s. 6d.; also a few roots of his Seedling Dahlias PRINCESS ALICE and TWICKENHAM RIVAL are still to be disposed of at the Nursery, Surrey-lane, Battersea.

FLORISTS' FLOWERS.—As the season for planting Ranunculuses is now on, J. and W. FINLAYSON, Florists, Paisley, respectfully intimate to the admirers of that beautiful flower and to Florists in general, that they have at present an excellent stock of their Splendid New Varieties, which they now offer for sale at greatly reduced prices, viz.:—

50 superfine sorts, one root of each	£3	0	0
50 ,, ,, one pair of each	5	5	0

Many of these have been sold at 5s. to 10s. 6d. per root, and their superiority over the old sorts is always apparent at competitions, where they invariably carried off the prizes. Also a Splendid Collection of Auriculas, comprising most of the leading sorts in the country, with many new and fine varieties. Also Polyanthuses, Pinks, Pansies, Carnations, Dahlias, Tulips, Phloxes, Antirrhinums, Herbaceous plants, &c. &c. Catalogues may be had on application, post paid. A remittance or reference will be required from unknown correspondents.

TO GENTLEMEN PLANTING.

J. AND J. FAIRBAIRN are induced from the uncertainty upon which they hold the Manor-street Nursery (situated contiguous to the Home Nursery, Clapham Rise, where attention will be given to all applications), to effect a Sale of the Stock at as early a period as possible, consequently beg to solicit the attention of Gentlemen and the trade to the large and remarkably healthy and well-grown stock, consisting of fine large Laurels, twice transplanted, of extra growth, Portugal Laurels, very handsome; Green Hollies, of various sizes, Evergreen Privets, fine Standard and Dwarf Roses in great variety, fine standard flowering Thorns, Almonds, Esculus, Robinias, and other Ornamental Trees, and Evergreen and flowering Shrubs, with a large stock of fine standard and dwarf, trained and untrained Peaches, Nectarines, Apples, Pears, Plums, and Cherries, of the most approved kinds, and of growth rarely equalled; also, a large assortment of Forest Trees, consisting of Limes, Elms, Birch, Beech, Hornbeam, Spanish and Horse Chesnuts, Mountain Ash, Poplars, and Spruce, and Scotch Firs; also a large number of Gooseberries and Currants, of excellent growth, and of the best varieties in cultivation, to all of which J. & J. F. respectfully invite the inspection of Gentlemen and Nurserymen, flattering themselves that the general character of the Stock is such as to ensure unqualified satisfaction, and which they are disposed to offer at very moderate prices for cash.

J. & J. F. respectfully beg to call the attention of Gentlemen to their advertisement of Heaths, &c., which has lately appeared in the *Gardeners' Chronicle*. (Oct. 21 and 28.)

Nurseries, Clapham, near London, Jan. 31, 1844.

SPLENDID NEW SEEDLING CINERARIAS.—Fine early-flowering strong plants of CINERARIAS, saved from the very choicest sorts of blue and crimson colours, selected from between five and six thousand Seedlings of last year. Those purchasing will have an opportunity of flowering some of the choicest sorts in cultivation, remarkably healthy, and having a large stock they can be sold at 9s. and 12s. per dozen, carefully packed for any part of the country. Applications including Post-office orders will be immediately executed. Large bunches of RUSSIAN VIOLETS in full flower, fit for potting, 6s. and 9s. per doz.—Direct to MICHAEL BREWER, Sen., Cambridge Nursery.

TO GENTLEMEN and AMATEUR FLORISTS.—As the return of spring is fast approaching, so is the planting of that beautiful flower the RANUNCULUS. A few hundred roots to be parted with (with names), and a single root of the very high-coloured purple flower "Quixos," will be included in each hundred roots; the time of planting, February and March. Apply, pre-paid, to Mr. EVRE, Farnham, Surrey, where may be seen, in the blooming season, in Mr. EVRE'S Collection of PELARGONIUMS, some Seedlings, and other specimens of this most delightful, still improving flower.—Farnham, Surrey, Jan. 31.

Seed of Dwarf Furze and Broom; Seedling Berberries for Underwood. Spring Tares.

Everything new in Flower-seeds, of which Catalogues will soon be ready.—4, Great Russell-street, Covent Garden.

RANUNCULUSES, ANEMONES, CARNATIONS, AURICULAS and LILIUM LANCIFOLIUM.

H. GROOM, Clapham-rise, near London (removed from Walworth), by appointment FLORIST TO HER MAJESTY, begs to remind the Nobility, Gentry, and Amateurs, that this is the best season for obtaining Collections of the above Flowers, and that in consequence of the success he had in their cultivation last year, he can offer them at the following moderate prices:—

	£	s.	d.
100 Ranunculuses in 100 superb sorts with names	4	4	0
100 do. in 100 very fine sorts, do.	2	10	0
Superfine mixtures, from 7s. to 21s. per 100.			
100 Anemones in 100 superfine sorts, with names	2	10	0
100 Do. in 50 do. do. do.	2	0	0
Superfine mixtures, 10s. per 100.			
25 pair of Carnations, in 25 superfine sorts, with names	3	10	0
25 pair of Picotees, in 25 do. do. do.	2	10	0
25 Auriculas, in 25 superfine sorts, with names	3	13	6
Lilium lancifolium album, good bulbs, each	0	3	6
,, ,, ,, large bulbs, each	0	10	6
,, ,, punctatum, good bulbs, each	0	7	6
,, ,, ,, large bulbs, each	1	1	0

Catalogues may be had on application.—Jan., 1844.

ANEMONES AND RANUNCULUSES.—The entire Stock of an Amateur Florist, who has spared no expense in procuring the finest sorts, but whose garden having been sold for building purposes, is compelled to part with them, and offers them on the following terms:—

RANUNCULUSES.

100 Roots, finest sorts, double, named flowers	21s.
50 extra extra ditto	15s.
100 fine ditto in mixture	8s.
100 ditto, second quality	5s.
50 Tyso's best semi-double ditto for seed	4s.
Packets of 500 seeds saved last year	1s. 6d.

Any of the above will be sent post paid on receiving a remittance by Post-office order, or letter-stamps to the amount wanted.

ANEMONES.

100 Splendid, named, double flowers	21s.
50 extra fine ditto	12s.
100 fine ditto in mixture	7s.
50 fine scarlet ditto in mixtures	8s.
Packets of seeds, each	1s.

Apply to S. G. LEIGH, Wine-merchant, Oundle.

EARLY PEAS, &c.—HENRY D. CORMACK, SEEDSMAN, &c., begs to inform the readers of the *Gardeners' Chronicle* that they can be supplied with the following Early and Prolific Varieties, viz.: Cormack's Prince Albert, British Queen and Early Kent Peas; Taylor's Improved Windsor, and Johnson's Wonderful Bean; Manchester Red and Seymour's White Celery; Walker's Long and Hamilton's Cucumber, &c., with every other variety of Horticultural and Agricultural Seeds, at his Wholesale and Retail Seed Warehouse, 105, Deansgate, Manchester.

SHILLING'S EARLY GROTTO PEA.

J. AND S. SHILLING have succeeded in raising the above PEA, the Early Frame Pea, impregnated with the Grotto or Oyster Marrow, which they, with confidence, recommend to the Public generally, being quite as early, and nearly double the size of any other Pea in cultivation. Quite hardy, will stand the winter well, and a good bearer; the pod large and long. They would particularly recommend it to the attention of Market Gardeners. Price 3s. per quart; 10s. per gallon; 17s. 6d. per peck; 30s. per half-bushel; 2*l.* 10s. per bushel. Agents—Messrs. FIELD and CHILD, 119, Lower Thames-street, London; Messrs. W. and J. NOBLE, 152, Fleet street; Mr. KERNAN, 4, Great Russell-street, Covent Garden; Messrs. HURST and McMULLEN, 61, Leadenhall-street; Messrs. GRAY, ADAMS, and HOGG, Kensington; Mr. T. D. WATKINSON, Market place, Manchester.—Northwarnborough Nursery, near Odiham Hants.

THE BRITISH QUEEN AND PRINCE ALBERT PEAS.

WM. JNO. CORMACK begs to call the attention of Noblemen, Gentlemen, and others, to the above two new Varieties, the merits of which are thus noticed in the *Gardeners' Chronicle*. "THE BRITISH QUEEN on light soils, is the best of all kinds, and will drive Knight's Tall Marrow out of the garden." "THE PRINCE ALBERT, which has been cultivated in the Garden of the Horticultural Society during the season, produced Peas fit for the table *ten days earlier* than any other variety sown at the same time." Both varieties may be had in packages at 3s. 6d. each, at W. J. C.'s wholesale Establishment, Newcross, or the Bedford Conservatory, Covent Garden.

THE undermentioned, with a select Assortment of FLOWER and other GARDEN SEEDS, may be had new, as annually received from the respective growers, at moderate prices, from THOS. D. WATKINSON, ORIGINAL SEED ESTABLISHMENT, 6, Market-place, Manchester:—New Early Dwarf Thompsonian Peas, a prolific bearer; Shilling's New Early Grotto, Prince Albert; Knight's Marrow, &c. True Johnson's Wonderful Beans; Large Improved Windsor, Myatt's Treble-curled Parsley; True Walcheren Cauliflower Broccoli; Cuthill's Long Black Spine and Manchester Improved Long Frame Cucumber; Whyte's extra fine Dwarf Red Beet; True Altringham Carrot; and superior Yellow Garden Turnip; Ashleaved forcing Kidneys and other Early Potatoes; Extra fine Red and Pink, Lancashire Giant, Solid, and Seymour's superior White Celery; Tobacco Paper; Mushroom Spawn, &c. &c. Catalogues on application.

Agent for Whitney's Waterproof Composition and Humphrey's Compound. May's Select Pansy and Hollyhock Seed, in packets at 2s. 6d. and 5s. each.

R. WHITE & Co.'s Collection of Plants, of which a Catalogue is now in the press and will be ready in about a week, comprises every variety of Geranium, Fuchsia, Verbena, Chrysanthemum, Dahlia, &c. which is worthy of cultivation. The following collections are offered, the selection being left to the purchaser:—

			£	s.	d.
40	first-rate varieties of	Geranium	5	0	0
20	,, ,,	do.	3	0	0
12	,, ,,	New do.	3	0	0
20	,, ,,	Fuchsia	1	1	0
40	,, ,,	Chrysanthemum	1	1	0
20	,, ,,	Verbena, including Seedlings which were submitted to Dr. Lindley for his opinion, and reported to be "all very fine," see *Gardeners' Chronicle*	Alfred	1	1	0
12	first-rate Dahlias			1	1	0
100	fine show do.			2	10	0

The above will be ready for delivery in strong plants the first weeks of April and May; and orders containing remittances will be executed in strict priority. Orders amounting to 5*l.* will be delivered free.—WANTED, a RESPECTABLE YOUTH as APPRENTICE.—Poole Nursery.

CAMBERWELL.—CAMDEN NURSERY GROUNDS.

MESSRS. ELLIS AND SON will SELL by AUCTION, on the above Premises, near Camden Chapel, Peckham-road, on Tuesday, the 6th of February, and following day at 11, on account of the number of lots, under distress for rent, the entire STOCK, Buildings, and Tools; consisting of two capital Greenhouses, 26 feet in length, heated by hot-water-pipes, Forcing pits, Cucumber and hand-lights, Shop fixtures, a case of 150 drawers labelled for seeds, and sundry tools. The stock includes an extensive assortment of standard and wall-fruit trees, a great variety of well-selected Roses, Geraniums, and Greenhouse plants, Picotees, Auriculas, Dahlias, Jessamins, Myrtles, Camellias, American plants, Shrubs, and Evergreens, some good specimens of Ornamental trees, and fine Mulberries, a number of Gooseberry and Currant trees, various seeds, &c. To be viewed three days prior to the sale. Catalogues may be had on the premises; at the Horns, Kennington; of Messrs. Fairbairn, nurserymen, Clapham rise; of Messrs. Forrest and Co. nurserymen, Kensington-road; and of Messrs. ELLIS and SON, auctioneers, 36, Fenchurch-street.

VALUABLE NURSERY STOCK, IVER HEATH, BUCKS.

MESSRS. SEDGWICK AND SON have received Instructions to Sell by Auction, on the Premises, near the Crooked Billet, on Iver Heath, on Monday, February 12, at Eleven, in convenient Lots,

About 2000 fine PORTUGAL and other LAURELS from 1 to 8 feet, a very large and choice collection of standard and dwarf Apple, Pear, and Cherry trees; some very handsome Yew plants of good growth, Larch, Spruce, and Scotch Firs; seedling Oak and other Forest trees, plain and variegated Box, Arbutus, Privet, Laburnums, Scarlet Thorn, Lilacs, Roses, &c. &c. &c., in the Nursery adjoining the road leading from Uxbridge to Langley.

May be viewed four days prior to the sale (Sunday excepted), when catalogues may be had at the Crooked Billet, Iver Heath, at the principal Inns in the neighbourhood; at the King's Arms Inn, Oxford Street, London; and of Messrs. SEDGWICK and Son, land and timber surveyors and estate agents, Rickmansworth, Herts.

TO GENTLEMEN AND OTHERS ENGAGED IN PLANTING.

MESSRS. PROTHEROE and MORRIS are instructed by the Proprietors to submit to public competition, in consequence of the expiration of lease, on MONDAY, MARCH 4, 1844, and following days, at 11 o'Clock, THE STOCK OF ONE OF THE KENSINGTON NURSERIES, next the Great West Road, consisting of large, healthy, and well-grown Specimens of Ornamental Trees and Shrubs, of every description, Variegated and Green Hollies, Evergreen Oaks, and Cork-trees, Large Fan and other Yews, twice-transplanted Common and Portugal Laurels, Arbutus, Alaternus, &c., Hemlock Spruce, Pinus Laricio, P. austriaca, and nigricans, &c. &c. These Grounds have long been celebrated for the Health and Beauty of their Trees and Shrubs, and safety of removal, and well worth the attention of those Gentlemen who intend Planting in the spring. American Nursery, Leytonstone.

IN an Advertisement of Messrs. PROTHEROE & MORRIS inserted in this Paper of last week, it is stated that these gentlemen have instructions from the proprietors to offer for sale the stock of "One of the KENSINGTON NURSERIES next the Great West Road." As our Nursery is situated next the Great West Road, and a great part of it is in the parish of Kensington, it is known to many of our customers by the name of "The Kensington Nursery," and the names of the proprietors not being given in the Advertisement, they may naturally suppose that it is our stock which is to be sold. We therefore inform them that such is not the case, but that we are prepared, as usual, to receive their esteemed orders, which shall be attended to with the greatest possible care and promptitude.—GRAY, ADAMS, and HOGG. Brompton Park, Kensington Road, Feb. 1844.

HORTICULTURAL SOCIETY OF LONDON.—Notice is hereby given that the Exhibitions of Flowers and Fruit, in the Society's Garden, in the ensuing season, will take place on the following Saturdays, viz., May 18, June 15, and July 13; in addition to the regulations already announced, it has been resolved that the Judges be instructed, in making their awards, to take into consideration, whether the Plants to be exhibited have been exhibited previously during the season. Full information concerning these Exhibitions can be obtained upon application at 21, Regent-st.

GARDENERS' CHRONICLE.—Wanted a clean and perfect Copy of the 1st and 2d vols. of the *Gardeners' Chronicle*, for which the same to dispose of (or a complete set) will receive immediate attention on stating price, &c. to Mr. W. T. Jackson, Bookseller, Bury St. Edmunds.

WARNER AND WARNER, SEEDSMEN, 28, Cornhill, London, beg respectfully to refer their Friends to "Harrison's Floricultural Cabinet" for February, for their Advertisement of New and Select VEGETABLE and FLOWER SEEDS. Catalogues may be had on application. POTTER'S CELEBRATED [illegible] GUANO, in quart bottles, at 1s. 9d. each.

The Gardeners' Chronicle.

SATURDAY, FEBRUARY 3, 1844.

MEETINGS FOR THE TWO FOLLOWING WEEKS.

MONDAY, Feb. 5	Entomological	8	P.M.
TUESDAY, Feb. 6	Linnean	8	P.M.
WEDNESDAY, Feb. 7	Society of Arts	8	P.M.
THURSDAY, Feb. 15	Microscopical	7	P.M.

THE causes of the DISEASES OF PLANTS, like those of animals, may be divided into the *predisposing* and *exciting*. To the predisposing causes must be referred all those peculiarities in the structure and growth of a plant that would render it more liable to be attacked by disease than other individuals. Thus it is found that many varieties and species of plants, from primitive constitution and other causes, are more liable to certain diseases than others. These causes, then, which are frequently most obscure, are predisposing. They should not, however, be lost sight of, as it is an important fact to know that particular varieties or species are most subject to disease. The exciting causes of disease in plants are the increase, decrease, or alteration of the various external agents by which their life is maintained; these agents are light, heat, electricity, air, water, and the soil. It is through their action that the functions of life are carried on, and the plant grows and continues its species. In a state of nature the constitution of plants is adapted to the distribution of these agents on the globe, so that disease is not often met with in those which are wild; but when plants become cultivated, their natural relation to these agents is disturbed; and, like civilised man and domesticated animals, they become the subjects of disease. This does not, however, arise from any positive necessity, but from our ignorance of the precise circumstances by which health may be secured.

In endeavouring to estimate the influence of these agents on the production of disease, it should not be forgotten that diseases may arise from a complication of causes, and not simply from the too great or too little influence of one of the agents. Thus the deprivation of heat may act on plants growing on a bad soil when it would not on those growing on a good one. This will explain many apparent anomalies in the prevalence of epidemic diseases in plants, and will also point out the importance, in reporting cases of diseases in plants, of recording *all the circumstances in the history and position of the plant that can affect its structure or functions.*

The influence of *light* is very great on the healthy growth of plants; it acts as a stimulant, and by its agency the peculiar secretions of plants are almost entirely developed. When deprived of it, what is called *blanching* takes place. This is a disease of the plant, though purposely had recourse to in many gardening operations. Its effect is constantly produced to a greater or less extent on plants grown in this country which are natives of tropical climates, and it often lays the foundation of other diseases. Disease may also occur from excess of light, where plants growing naturally in dark shady situations are exposed to its influence.

Temperature has a more obvious influence on the health of plants than light. The diseases produced by a low temperature are very numerous, and there is no agent that plants will bear the diminution of so little as heat. Much depends on the circumstances of the plants. After the buds have expanded, the parts of the plant appear to bear cold better, the older they are. Frosts often deprive the stamens and pistils of flowers of their functions, and unfruitfulness is the result; leaves are spotted, and canker of the stem and branches are often produced by it. Plants never get inured to cold, for their structure does not appear to possess the adaptability of animals; and consequently, when brought from climates where the average temperature is higher than our own, they are sure, at one time or another, to suffer. Excess of heat frequently produces disease, although its consequences are very slight compared with those of cold. Sudden changes from hot to cold affect the secretions of plants, and to this cause honey-dew is most frequently to be attributed.

A due supply of *water* in the form of vapour in the atmosphere, and liquid in the soil, is necessary to most plants; but when either in too large or too small quantities, it is the cause of disease. Anasarca, or dropsy, occurs where there is too much moisture in the air; and the excessive development of hairs on particular parts of the plant is a consequence of dry air. When in too large quantities in the soil, canker, a premature falling of the leaves, and other diseases, are the consequence. Withering, and also a falling off of the leaves, is the consequence of too little water.

What influence the composition of the *soil* has on particular diseases of plants we are not in a position to state. Matters which are in excess in the soil are frequently taken up by plants and thrown out again as excretions on the surface. Thus, an excess of salt is often got rid of in the form of an excretion on the leaves by plants growing on the sea-shore. The want of particular ingredients will, it is well known, prevent plants from growing; but what the diseases are they suffer from is at present but little known.

Through the medium of the soil and air, various poisonous agents are introduced to plants. From this cause arise important effects requiring investigation. The precise influence of carburetted hydrogen, chlorine, sulphurous acid, and the gases in the air, is not known; and in the neighbourhood of towns a variety of injurious ingredients get into the soil which are destructive to vegetation.

To the influence of each of the above agents in producing disease we might have devoted a separate article, but our object has been to point out what are the causes of diseases rather than to give any lengthened account of them, in order that our readers may at once begin to co-operate with us in investigating the diseases of plants. When we proceed to describe particularly each disease, we shall have frequent occasion to refer at length to the causes of the departure from health in plants.

With regard to the treatment of diseases of plants, we shall have abundant reason to see that prevention is better than cure. Nevertheless, a knowledge of the causes of disease will frequently enable us, by removing them, to cure them; and this is more particularly the case with shrubs and trees. No treatment, however, can hold out any chance of success that is not founded upon a knowledge of the functions obstructed in diseased parts, and the causes which have contributed to such obstruction. We shall be glad of any communications on the subject of the treatment of diseases of plants, and hope our correspondents will remember that unsuccessful cases are equally valuable with successful ones.—*L. E.*

MOST heavy-land farmers know the value of PARING and BURNING their land. Experience has shown that no operation is to be compared to this for improving the fertility of soil. Gardeners, however, have been but little accustomed to practise it, and usually resort to other means, which, if as effectual, are far more expensive; for burning clay, if properly conducted, has the great merit of costing nothing beyond a little labour.

Why burnt clay should be better than that sort of soil in its ordinary condition, is sufficiently obvious. Its texture is changed. In its natural state it is so adhesive, that air cannot get into it, nor water out of it. It also offers great mechanical opposition to the passage of roots through its viscid mass, and hence it is exclusively inhabited by a coarse and worthless vegetation. Burning changes all this; the particles of clay lose their adhesiveness, and this alone gives a new character to the soil, which offers freedom to the entrance of air and exit of water, and which crumbles readily away beneath the advancing roots of a soft and succulent race of plants.

Such changes are in themselves most important; but this is not all the difference between burnt and unburnt clay. The roots of plants, which were before unable to decay, are reduced by fire to their saline constituents, and so enrich the land. And, moreover, the burnt particles of clay acquire the power of absorbing ammonia from the air, and holding it within their pores till showers fall and wash it into the land, where it immediately acts as a nourishing food to the crops.

The employment of burnt clay in gardens has, perhaps, been neglected in consequence of a supposed difficulty in conducting the operation. In our volume for 1843 we gave an account of a simple method by which large masses of clay may be set on fire for farming purposes; and we now publish the following excellent practical letter from Mr. W. Paul, of Cheshunt, in which his mode of proceeding and the results of it are explained.

It has been the custom here for some years, in spring, when the operations of pruning, &c. are ended, instead of suffering the rough branches to lie about, presenting an untidy appearance, to collect them in a heap, and build a wall of turf round them in a semicircular form about three feet high. They are then set fire to, and when about half burnt down, such weeds and other rubbish as collect in every garden, and will not readily decompose, are thrown on the top, and earth is gradually cast up as the fire breaks through.

During the first two or three days no ordinary care is requisite to keep the pile on fire, but after this, if the fire is not allowed to break through and thus expend itself, it will certainly spread through the whole heap, and almost any amount of soil may be burnt by still adding to the top. The soil we burn is the stiffest loam that can be found within our limits, and is rather of a clayey nature; also turf from the sides of ditches and ponds, in itself naturally sour and full of rank weeds.

The clay thus burnt has been found beneficial in every instance. In black garden-mould, where Peach-trees were disposed to sucker and canker, despite of animal manures and drainage, two or three annual dressings of burnt earth appear so to have altered the soil that they now grow clean, vigorous and healthy, are free from suckers, and produce roots completely matted with fibre. The like success has attended its application to other fruit-trees.

During the summer of 1842, six beds of Tea-scented Roses growing in an alluvial loam (the adjacent fields are of the same soil, and grow large crops of Wheat and Potatoes, but the particles of soil run together after rain, and present a smooth cemented surface) were manured with the following substances, viz., 1, bone-dust; 2, burnt earth; 3, nitrate of soda; 4, guano; 5, pigeon-dung; and 6, decomposed stable-manure. The guano produced the earliest visible effects, causing a vigorous growth, which continued through the season; the flowers, however, were not so abundant, and the shoots did not ripen well, and were consequently much cut with the frost. The bed manured with burnt earth next forced itself into notice; the plants kept up a steadier rate of growth, producing abundance of clean, well-formed blossoms; the wood ripened well, and sustained no injury during winter. The results of the other manures were not remarkable—acting as gentle stimulants, the nitrate of soda and bone-dust least visibly so—although they were applied in the quantities usually recommended by the vendors.

From the fact of the beds of Roses being all planted at the same date, and their progress being carefully watched, I would suggest the application of burnt earth as an excellent manure for Roses in adhesive soils, as well as for fruit-trees where disposed to canker. Whether it acted by furthering drainage, or by opening the soil to the fertilizing influences of the atmosphere, or by fixing the ammonia conveyed to the soil by rain, I do not pretend to say, but its value is sufficiently apparent. I believe it is considered that the vegetable matter contained in soils is destroyed by the act of burning; and I do not think the remains of the materials used in combustion could exercise any extended influence, as the quantity compared with the earth burned is so small, and the earth comes from the heap burnt red and hard, and a great portion quite free from the remains of the substances used in ignition.

Our readers will remember Mr. Rivers's advice about roasting turf, of the use of which this is a confirmation. It is perhaps as well to add, that burning is more injurious than advantageous to light soil.

THE ROSE GARDEN.—No. III.

(*Continued from page* 53.)

The following, which was taken from the side of a road from whence it was observed, may be considered as an extraordinary specimen for height, shape, health, size, and vigour.

The stem perfectly straight, with 36 branches upon it, many of which had side-shoots upon them; but as one-half of these were cut off in removing the head, and the remainder were close below them, the stock itself being very close-jointed, and the lower branches small, they formed little or no objection to the stem when removed.

When replanted, the height of the shoot was five feet one inch from the ground; it then divided itself into four branches, which were left for budding upon. The circumference at the base being four inches and a quarter, the centre three inches and a quarter, and at five feet one inch from the ground, two inches nine-sixteenths, the base being the largest part of the plant, which diminished gradually to the top.

The species was the green and brown, or grey striped, the prickles similar to those of the Eglantine in regularity; the wood so clean, that there was not a speck upon it, and the whole appearance that of an extremely healthy and vigorous plant of three seasons; its strongest shoots the autumnals of the present year, and near the top of the head; evidently showing that the sap was not likely to desert the stock and escape in suckers the next year. The root was, however, large, and furnished with but two or three fibres, which were found quite sufficient to maintain the plant in full vigour when moved. The branches left for working were not, however, fit for the purpose for want of a sufficient flow of sap, and were removed in the winter; but had they been taken off in the first instance, young wood would undoubtedly have been formed fit for use. From two feet six to three feet high to the first branch, and one inch three-quarters in circumference, may be considered a good size (very much above the average) for plants at their best, viz., either as ripened suckers of the current, or seasoned ones of the preceding, year.

The French Stocks are considered far superior to the English, and in consequence, when worked, afford an article of much commerce between the two countries; in France more trouble is bestowed upon worked Roses, as well as a more practical degree of knowledge. A large quantity of Stocks are placed in pots, and plunged for working, by which the roots are probably multiplied, (a circumstance in general the case in confined spaces, by which nature makes up to a certain degree for extent,) and

the branches are seldom mangled after having been worked. The climate alone, however, would be sufficient to account for a material difference between the produce of the two countries.

It is worth the while of an Amateur to observe an importation of unpotted French Rose trees on their arrival. If the lot be a picked one, he would hardly recognise the plants to be of the same species as those upon which he had been accustomed to operate, or believe the head produced upon them to be the growth of a single year. If, however, he is tempted to buy, not only the heads and stems must be taken into consideration, but the roots also—the French are in the habit of budding in hedges, and of removing the plant from thence for sale. If several suckers have arisen from the same root, and all but one be cut away, it is evident that the stem so left will receive the nourishment of the whole root; and if a bud be placed on such stem it will form a complete head in one season; yet when the plant is removed, the root will be found far too large, woody, and unsupplied with fibres for transplantation in its present shape, and when reduced and removed, its vitality may be destroyed, and must be injured, and it is not therefore likely to maintain the head it carries during the present year, in vigorous health through the next.

The largest Stocks are those which have an oval fruit, (they are called indiscriminately, Dog Roses, Buckbriars, Hangbriars, &c. by the countrymen, though the varieties are endless); with these, if the height be proportioned to the size, no support is necessary even when the tree is complete, unless the head be very large; but as different Roses require different Stocks, this advantage with some species of Rose cannot be obtained.

The produce of one hedge will be found to differ from that of another most materially, both as to size, height, woodiness, colour, mode of growth, &c.: some being covered with prickles like the Eglantine, some with prickles more dispersed, some have the bushy growth of the common China, shooting apparently from one joint just below the soil; others with a confused root like the small species of Lilac; some travelling over space after space by means of suckers; some with compact, others with straggling heads; some places appear to produce nothing but inferior stocks; others none but the tallest and stoutest.

The small green round-berried stocks are least able to resist the frost; they are, in consequence, planted double the height required, left to grow as they please, and budded a foot from the ground in the stem instead of the shoot, which the thinness and flexibility of the bark renders extremely easy, being thus suited for pots, &c.

Youth, as above stated, is not a matter to be insisted upon, but as all young plants of the wild Rose will generally be found to possess the most fibrous roots, they are in consequence more likely to maintain their power of free growth when transplanted than old ones.

(To be continued.)

ENTOMOLOGY.

The House Flies.—Amongst domestic plagues flies are generally included. Few persons know from whence they come, or are aware that there are numerous species which inhabit our dwellings; some a good deal resemble each other, it is true, whilst a few are so very dissimilar, that, even to the indifferent observer, there is such a marked disproportion in size, that the smaller ones are at once pronounced to be the young of the larger individuals. In our days, when Natural Science has arrived at such a degree of perfection as it had never previously attained—when every year, indeed, every week, brings forth works of amusement and instruction adapted to every age, as well as for every class of society—when we have such popular volumes as Kirby and Spence's "Introduction to Entomology," "Penny Magazines," and equally cheap Cyclopædias—it seems incredible, to those who have a taste for scientific pursuits, that any one in England should not be better informed concerning the works of the Creation which daily surround us, than to suppose that flies vary in size according to their age, and that consequently the large and small are the old and young of the same species. To assist in dissipating such errors, and to establish truth in their stead, being our great aim, we will introduce the history of the House-fly. There are fifty, perhaps a hundred, different sorts of flies and gnats which annually visit our apartments: I mean regular domestics, for if casual visitors be included the numbers will be quadrupled. Amongst the former are the Green-bottle flies, the Blue-bottle or Flesh-fly, and another very like it called the Larder-fly, bouncing against the windows; then there is the biting House-fly, which interrupts our reveries by stinging the legs and ancles, also the lesser and larger House-flies, alighting on our food and soiling the furniture.

Their economy and transformation being similar, we need only give the history of the last at present. The House-fly, like most other insects, lays eggs, and probably a considerable number; these are deposited in hot and moist dunghills, and probably in putrifying vegetables and refuse in gardens, muck-bins, and similar situations, and hatching into minute maggots of a dirty white and yellow colour, they feed until they arrive at the size of fig. 2, and greatly resemble the gentles which are used for bait in fishing, and which are generally the maggots of the Blue-bottle fly—except that they are totally destitute of the fleshy tubercles which those larvæ have the power of protruding from their bodies to aid their locomotion. When fat and full-fed, they lie dormant a few hours, during which time the skin hardens and becomes an oval cylindrical horny case, of a chesnut or rusty brown colour (fig. 3); and in this the two-winged flies, called Diptera, differ, perhaps, from all the other orders of insects, which cast their skins when they become chrysalides. In this quiescent state they remain from a few days to as many weeks, according to the temperature, many of them, no doubt, sleeping through the winter. Whilst in this state of repose, the recent maggot is undergoing a wonderful transformation within his own skin, which at last opens at one end by a little circular lid, and out creeps the House-fly with its body and six legs, as large as they are at any subsequent period of its life—indeed, the abdomen is often larger, as it is filled with a fluid, which is afterwards discharged; but without this the wings would not expand: for when the fly issues from his tomb, the only part which has to grow is the wings; these are two little crumpled moist objects on each side of its body, like two pockets; its first object, therefore, is, before they dry, to crawl up a wall or straw, when the fluid gravitates or is forced into the nervures or delicate veins of the wings, which expands all the wrinkles, for they are not folds, and at last these organs are stretched out and covered with a delicate transparent but iridescent membrane, and then the little animal is ready for flight.

It is now time to describe the Housefly, which is magnified (fig. 1), the cross lines showing its natural dimensions when the wings are expanded. It is one of the few insects which still bears the name assigned to it by Linnæus, who called it Musca domestica; it is clothed with black hairs and bristles; the antennæ are black, with feathered setæ; the eyes are remote, particularly in the females, and are of a dull or brownish red; the space between them is black, but the face is satiny yellowish white, and a similar line surrounds the eyes; the thorax is bright grey, with four blackish longitudinal lines; the abdomen cinereous or clouded ochreous, with a blackish line down the back, and smaller elongated spots on each side, varying with the light; the belly is ochreous, base of the wings yellowish; the six legs are long, slender, and blackish. The abdomen of the male is of a transparent ochre on the sides, and the apex is rounded; but in the female it is conical, and often of a clouded ash-colour.

A very accurate observer, Mr. R. H. Lewis, says—that this and some other flies "were common in the ship from England to Van Diemen's Land, breeding in the rotten Potatoes, &c. No wonder, therefore, that this fly is so much diffused; and it will probably be difficult to fix its original country. I can state from personal observation that the Musca domestica of Canada, the United States, Cape of Good Hope, and Hobart Town (where they are very numerous), are identically one and the same species with that of England; and from the facility with which it propagates, I think it probable that it is to be found in every part of the world. * To the same genus belongs Musca Cæsar Linn., the Green-bottle fly, † and the Musca vomitoria Linn., the Blue-bottle or Flesh-fly; but another, exceedingly like it, the Larder-fly, is associated with another genus, and is named Anthomyia lardaria; the nervures of the wings are different, as shown in fig. 5, those at fig. 6 being parallel; whereas, in the true Musca, fig. 1, the cells are closed, or nearly so, by oblique nervures. The Lesser house-fly is now a member of the genus Anthomyia also, and is the M. canicularis Linn.; it is very like M. domestica in colour and markings. The biting Housefly, although so like the darker female of M. domestica, is far removed from it, by the structure of its mouth, which is horny and formed for piercing; it is named Stomoxys calcitrans. ‡ —*Ruricola.*

FAMILIAR BOTANY.

Morphology.

> "You see one pervading idea, worked out in every portion; no one thing appearing as an after-thought, though perhaps not introduced till a period long subsequent to the first foundation. The true spirit of Gothic architecture is that of living vegetation: it is the expansion of the vitality of the germ; and, where this vitality exists, each addition harmonises as naturally with the portion upon which it is based, as the leaf does when it springs out of the branch, and as the flower does when it blooms amongst the verdure. However the building may spread and fructify, it is still one organic whole; and this is truly a transcendent excellence, which no other production of human art ever acquired."

Thus speaks a clever modern writer, when describing the Cathedral of Cologne; few consider with what truth and justice, as regards the beautiful simile derived from the vegetable world. Let me endeavour to illustrate the Author's meaning, and work out at length an idea rich in admirable truths, pregnant with the true philosophy of Natural History, and having a direct, though perhaps not apparent, relation to some of the commonest facts of Gardening.

In modern times there has sprung up a branch of science named *Morphology*, so called from two Greek words signifying *a talk about form*, the object of which is to show that in all the works of the creation the plan of structure is extremely simple, although the object constructed may be very complicated; that things, the most unlike, owe their want of likeness to peculiar combinations of things similar, or even identical, and not in their original nature distinct; and, in short, that the multitudinous forms with which all nature teems, are so many evidences of the most amazing skill applied by an allwise Creator to the construction of living matter out of a few general and simple parts.

The Mineralogist shows that chalk, Carrara marble, and Iceland spar—peculiar combinations of a kind of air called carbonic acid, and of lime—are the same thing with their particles in different states of cohesion; and that charcoal and the diamond, flint, rock-crystal, the amethyst, and opal, stand in a similar relation to each other. The Chemist finds gum, starch and sugar to be mere compounds of charcoal and water; four so-called elements to be the basis of all the various forms of vegetation; and possibly two elements, each an impalpable air, to constitute all matter. In like manner, in the vegetable kingdom, experience teaches us that, putting aside the common nature of the ultimate elements of matter, all the various organs which decorate a plant, however dissimilar they may be, and notwithstanding the various uses for which they are destined, are in reality mere variations of one common organ, expanded and united in different ways, and appearing under a multitude of distinct forms. All branches of science which treat of these singular facts may be termed Morphology, but that word is chiefly used in speaking of plants and animals.

Among plants these truths are exemplified in so extraordinary a manner, as to have excited doubts in some persons as to their existence. It has seemed to some minds so inconceivable that the scarlet blossom of the Lily should be composed of the same parts as the green foliage that stands below it, or that the succulent fruit of the Peach should be one of the thin leaves of the Peach-tree folded up and altered, that, without attempting to examine the facts on which the doctrines of Morphology depend, they have rashly accused its advocates of Atheism, and proclaimed one of the most wonderful manifestations of Divine power and contrivance with which man is acquainted, a sign of materialism, and a badge of infidelity. If I did not know how often clamour beats down truth, for a time at least, and what influence is exercised over the thoughtless by strong assertion, when it is not contradicted, I should probably have left a demonstration of the facts of Morphology to some other pen; but it seems due to the readers of this Paper to put them in possession of the evidence, and to dispose of the many foolish notions that are prevalent on the subject. I shall therefore endeavour, during the present season, to bring forward, at short intervals, a complete series of illustrations of the manner in which morphologists support their case. In the meanwhile it may be stated, for the satisfaction of the feeble-minded, that Linnæus was one of the fathers of these opinions, and no one ever accused that great man of Atheism or infidelity.

It is surprising that those who are shocked at the idea of a leaf being converted into a fruit should never have considered some very common facts with which they can hardly be unacquainted. The following passage from the writings of a modern Swedish authoress may be recommended to their attention until we can resume the subject:—

"The flower appears to us at first as a seed, then a sprout; the sprout becomes a bud, and now the flower unfolds itself. Similar changes are shown us by other objects in nature. See, yonder creeps the despised crawling caterpillar. The hour comes, and the feebleness of death falls upon him; he gathers himself up and weaves the cocoon; this web forms his shroud, while the organs of his new being are already inclosed within him; now the rings appear, the inner powers are struggling now the change goes forward and decay appears; his ten feet remain upon the old skin, and the new creature lies with its limbs yet unformed. By degrees these come forth: order, but the creature does not awake till all is perfect now he presses towards the light, and the last change quickly made. A few minutes and the tender wings become ten times larger than when beneath the dead shroud; they are gifted with an elastic strength, and glitter in every ray of the sun. His whole being changed; instead of the Grass and leaves for which he was before created, he now sips nectar-dew from the golden cups. Who would perceive in the form of the caterpillar the future butterfly? Who would recognise in both one and the same creature, if observation did not teach it us? And both existences are only one life, and the two beings are one and the same earth, in which the organic curve constantly repeats itself."

What is there in the transformation of a leaf into a flower or fruit more remarkable than this?—*R. E.*

BEES.—No. V.

(Continued from p. 51.)

The Feeding of Bees.—Some springs are so very rainy that Bees cannot gather enough to keep themselves; sometimes rainy weather immediately ensues after swarming, and sometimes a rainy summer hinders Bees from laying in a sufficient store of provisions to keep them alive in spring: on such occasions feeding becomes necessary. The best thing to feed Bees with is loaf-sugar and water at the rate of a pound of sugar to a pint of water, slightly boiled. Raw sugar and water produces diarrhœa, and is often used in spring; indeed, I have used it in autumn, and saw no bad effects resulting therefrom. Foreign (Russian and Prussian) honey has been used. One gentleman, who had used honey from Dantzic, told me that if it was given to Bees in an unadulterated state (that is, not mixed with sugar), it would poison them; and another told me that his father fed his Bees with Russian honey, and that was good and safe enough for such a purpose; but I myself never saw it used. Bees will even eat treacle and boiled

1844.]

flavour, if soaked in sugar and water; but I recommend nothing but loaf or refined sugar and water. When I say that it is better than anything else, I of course exclude Bees sooner. Some Beekeepers use porter or ale instead of water, which is more expensive and no better. Some may object to loaf-sugar because it is dearer than raw; but let me say that it is nearly as cheap, for less serves Bees. Five pounds of honey collected from the flowers of White or Dutch Clover last nearly, if not quite, as long as 7lbs. collected from the blossoms of Heather or Ling—or, as it is sometimes called, Heath. There are various systems of feeding. I will not offer an objection to any; but I would recommend the following:—Turn up the hive, place it against your thigh or your knee, and pour the liquid first on the one side of the combs, and then on the other. If the combs are held at an angle of 45°, the liquid runs into the cells before it reaches the crown of the hive. The Bees soon lick the liquid off themselves. Both in a profitable and speedy point of view this system, I think, surpasses any other for autumn feeding; for one man, in one day, could give 50 hives 5 lbs. each; that is to say, five or six doses. If Bees are fed every day they do not lay by much; it causes them to fly about a great deal hence it is dangerous to feed in cold weather. Where time is no object, tin troughs and cisterns ought to be used in spring. In feeding swarms that have not waxed their combs down to the boards, soup or broth-plates are used. A few straws are cut and placed on the sugar and water, to facilitate its being taken up, and to prevent the Bees from drowning themselves therein. The Bees form or make ladders of themselves, which reach from the body of the swarms to the centre of the plates. These ladders save many Bees the trouble of going round about by the sides of their hives. It is advisable to feed young swarms in rainy weather, whether they are needful or not, for Bees, at the swarming season, make combs very fast from sugar or treacle, wax being a secretion of Bees and not of plants. If young swarms are not attended to during unfavourable weather, their numbers decrease instead of increase, because they have scarcely any comb to breed in.

Upon the immuring of Bees in winter I did not intend to offer a remark; but I wrote to Carluke in order to learn if any one there had buried his Bees in winter; at the same time I desired the person whom I wrote to, to bury two of his hives or stocks—one without food and another with a sufficient quantity to keep the Bees alive. In answer to my letter, my correspondent informs me that "no one here has tried the burying system, and I dare say never shall; for a man in Cambusnethan (the adjoining parish) buried one with as much honey in it as would have kept the Bees alive above ground till the spring: when he took it out all the honey was eaten and the Bees were dead." This quotation teaches us that Bees live under the ground when they have food, but die when they have none—and that they eat more under than above the ground. The first and second of these are in accordance with common sense, and the last with philosophy. If Bees live under the ground without food during the months of October, November, December, and January, it is but fair to infer that they will live four weeks in summer likewise! We are open to conviction; but it will be a hard matter to make us believe this.—*A. Pettigrew, Wrotham Park, Middlesex.*

(*To be continued.*)

DURABILITY OF OAK TIMBER, FELLED WITH THE BARK ON IN WINTER.

I send you two specimens of Oak bark, with their dates, taken from beams in old buildings, lately taken down in this neighbourhood, which prove beyond doubt that winter is the best time for felling Oak timber, when durability is required.

No. 1 was taken from a beam in an old house in Llanymynech, in the county of Salop; the date cut in a stone on which one end of it rested is 1316, which, subtracted from 1843, makes its age 527 years. The timber under the bark is quite hard and sound, as may be imagined from the state of the bark, which appears as sound, fresh, and heavy, as if it had been there only a short time; the beam had been covered over thickly with lath and plaster. No. 2 was obtained from a beam in an old building in Oswestry that was taken down; the date 1035 was cut in the timber in two or three places; this, subtracted from 1843, makes it's age 808 years. The bark was quite fresh and sound, and the timber under it was the same; the ends of the beams, having been over a doorway, and exposed to the weather, were decaying; but the other parts were sound.

This incontestably proves that Oak timber is most durable when felled with the bark on: whether our forefathers knew this by experience, or merely did so by chance, the bark at those times being possibly of little or no value, is more than I can affirm. The fact of its durability when found in this way has been further confirmed by the evidence of persons who have had much experience in working up timber from old buildings. At another place, near Oswestry, was Oak timber found with bark on, nearly 900 years old. It was reported to be quite sound by the person who worked it up for fresh purposes.

There was lately sold, in a neighbouring Welsh county, to a Dock Company at Liverpool, two Oak trees, to be felled with the bark on, in winter, purposely for gates to docks, for 6*s.* 6*d.* per foot; one tree contained 120 feet, and the other 125 feet of timber.

I am informed that coach-makers, who require hard, durable timber, purchase it while standing, and have it felled in winter, sacrificing the value of the bark. The white or sap-wood of the Oak will begin to decay in a very short time when peeled and felled in spring, whereas it has been proved by experience that it is hard and sound when felled with the bark on, in winter.

From these facts there appears little, if any doubt, that Oak timber felled with the bark on is the most durable. —*W. Billington.*

[The specimens sent by Mr. B. are perfectly sound, and appear to belong to trees that have never been even squared.]

Home Correspondence.

Border Carnations and Picotees.—For Carnations I would recommend Hoyle's Duke of Leeds, and Ely's Dragoon, S. B.; Gregory's Alfred, and Ely's Duke of Bedford, C. B.; Ely's Bright Venus, and Orson's Rob Roy, S. F.; Ely's Lady Ely, Hogg's Lady Stanley, Chadwick's Lucette, R. F.; Elliot's British Queen, P. F. Hoyle's Duke of Leeds, when run, is more admired by ladies here than when clean—the petals are apparently thicker and more velvetty in the run-flowers, and their colour very rich and dark. Is this alteration in substance of petal owing to the effect of light? This flower is increased readily by pipings. I have observed that pipings of it in a glass with others are often the first rooted. Dragoon is easily piped, but layers of it will flag unless immediately placed in the shade. Duke of Bedford and Bright Venus seldom run with me; the other sorts will, but in a border this is no objection. They are all good growers, easily propagated, and their price does not exceed, on the average, one shilling per pair. Maud's Rowton, scarlet flake, when run, is a beautiful object in the border; in the clear flowers the white is not good. Ely's Tree Carnation, scarlet flake, throws up a tall flower-stalk, from the sides of which spring numerous shoots, all which can be piped. The calyx is often "Wheat-ear." I have seen this variety look very interesting and showy when blooming in a greenhouse in winter. The following Picotees are suitable for a border. Red—Ely's Criterion, Hardy's Royal Briton, Woolard's Miss Bacon, Hirst's Admiral Sotheron, Banton's Mazeppa. Purple—Lee's Lady Wildman, Pullen's Incomparable, and Lady Peel, Birtle's Lady Fair, Kirtland's Victoria, Jackson's Delight. Rose—Giddin's Hemingford Beauty, Syke's Eliza, Wilson's Fanny Irby. Yellow—Martin's Victoria, Hamburg Yellow. All these are cheap, showy, and readily increased.—*O.*

Pits.—Our correspondent "Economist," who some time ago requested Mr. Paxton's opinion respecting the most economical mode of constructing a range of pits for general purposes, such as for growing Pines, Cucumbers, Melons, &c., also Pelargoniums, Fuchsias, Calceolarias, Heaths, and other greenhouse-plants, is answered in the following:—

Fig. 1.—Longitudinal Section.

Fig. 2.—Transverse Section.—Scale ⅛ of an inch to a foot.

"The best method of building pits is to construct them of nine-inch brick on bed, and the best mode of heating them is by Rogers' Conical Boiler. In the present case, "Economist" may build a pit 78 feet long inside and 7 feet wide. Cover the pit with a ridge and furrow roof, making the space from the ground in front of the pit to the valley-rafter 3 feet 6 inches, and the back wall below the rafter 5 feet 6 inches—see section across the pit, *fig.* 2. Divide the whole length into four compartments for growing the different sorts of plants, by 4½ inch brick-on-bed walls. Divide the whole length of the ridge and furrow-roof into 12 bays, having a ventilator in the angle of each pediment, as at *d d*, *fig.* 1. Now, to get to the plants, each light is hinged at the valley-rafter, and fastened with a thumb-button at the ridge-rafter. By referring to *fig.* 1, it will be seen that the light or frame leaves the ridge-rafter at *a* in the direction of *b*, and lies flat upon the next light at *c*. Each light may be opened in this way, so that a workman may get to any part of the pit."—*Joseph Paxton.*

Charcoal.—Last year I potted two standard Hydrangeas in 16 sized pots, with two-thirds turfy loam, and one-third sifted charcoal; the drainage, which was three inches deep, I formed of coarse pieces of charcoal: when the plants bloomed, I found the colour of the flowers to be a beautiful bright blue, and so they continued to flower the whole of the season. Every plant seems to delight in charcoal; since I have laid charcoal merely on the surface of the mould, round the stems of many of my large Orange and Lemon trees, the alteration has been very striking; the foliage assuming a dark rich hue, and the plants being altogether most luxuriant. It is my opinion that large beds of blue Hydrangeas might be easily obtained by the above treatment.—*J. L. Snow, Swinton Gardens.*

Charcoal.—In the Forest of Dean I observed that the Charcoal "hearths or floors" soon became spontaneously covered with seedling Willows, of a very vigorous growth. These seedlings made their appearance in about a year after the fires, and I do not recollect any other kind of seed germinating there except the Willows. Some time ago I saw in the *Chronicle* observations on a kind of shale as a manure. Now in this forest is a kind of blue shale over the stratum of coal, this after being exposed to the atmosphere for some time crumbles down like shell marl. Mounds round some old coal-pits composed of this material were planted with Oaks, which became the most vigorous of any in the forest, and were covered with healthy dark-green shining leaves. The coal shale is a valuable manure and would be useful to farmers, particularly upon light sandy heath and bog soils, and in localities where it abounds the proprietors of coal-works might profit by it.—*W. Billington, Oswestry, Salop.*

Curl in Potatoes.—Mr. Barnes, at p. 424 of the "Gardeners' Magazine," mentions that the disease known by the name of "curl" is chiefly occasioned by the use of seed Potatoes not fully ripened. Mr. Dixon has made the same observation in his treatise on that disease. This, however, will not suffice to account for it: for how is it that the "curl" does not affect Potatoes on some particular soils, even when little attention has been paid to the quality of the seed; while on other soils it attacks them, however well ripened the seed-Potatoes might have been? The former happens in moorland districts; the latter on light rich soil near Edinburgh. In order to prevent "curl," I have known gardeners at the latter place procure seed from their friends in the Moorlands. If they did not continue to do this, the "curl" would appear the second or third year. This supports the opinion that the disease is occasioned in some measure by the richness of the soil, or rather by its having been long under cultivation. It has been imagined to be owing to the tubers decaying in the soil; but this does not explain why some soils affect them and not others. Decayed tops make a good and useful manure for a succeeding crop of the same kind; why then should decayed roots be prejudicial? Mr. Barnes speaks of "curl" being caused by the over-ripeness of seed-Potatoes, and yet says that—"all Potatoes that are meant for seed should be ripe and hardened by the sun and air." He further observes that "all kinds of seed may be over-ripe—that is, lose a considerable quantity of its properties." He complains of the plan of planting Potatoes late, without stating what has generally led to it. He must be aware that when the late kinds of Potatoes are planted early, for instance, about the latter part of May, or 1st of June, especially on light land, they are apt to make what is called a second growth. To prevent this, the Norfolk farmers defer planting their Potatoes until the 1st of June, in order that the tubers may not be prematurely ripened by the Midsummer drought; otherwise they would send forth many more little Potatoes, to the serious injury of the main crop. In this case the first-formed Potatoes are hard and fibrous, and the small ones produced from them, and attached to them by shoots, are small, and fit only for pigs.—*J. Wighton, Cossey Gardens.*

Pine Apples.—Although I have not been engaged in Pine growing for nearly five years, I am much interested in the culture of that delicious fruit. Mr. Murray says, that he "adopts the large-shift system to a much greater extent than is recommended by Mr. Glendinning, and proposes to carry it still farther next year." In a leader it is stated "that this is a certain precursor of getting rid of potting altogether." I quite agree with this remark, and have little doubt but that the natural system, (as it may be termed,) in time, will be generally practised. I am the more satisfied of this from having had some experience in the growing of Pines without pots for several years, and shall here give you a short account of my proceedings and success. About ten years ago my employer caused two Pine-houses to be built; the pit for the Pines was about two feet deep, with a hot-air chamber below heated by a flue. Being fully aware that a dry heat would not answer, I had large pans placed along the top of the flue to be kept filled with water, and had also water dashed along the floor of the chamber every morning. There were ventilators from the outside to admit cold air into the lower part of the chamber, and also ventilators in front and back of the pit, connected with the hot-air chamber, so as to admit the hot air into the house when required. In March I prepared my bed for the Pines and turned out one-year-old plants; they had been growing the first 5 months without pots in an old Pine pit; they were afterwards potted into rather a large shift, where they remained until I turned them out into the new pit in March following. They grew very strong, and a few began to show fruit about the middle of May, and continued doing so up to the middle of July, when all had shown fruit; they swelled off very well, and produced fruit from 3lbs. to 5lbs. avoirdupois; they chiefly consisted of the Queen, Globe, Enville, Jamaica, Otaheite, and Montserrat. I continued the same plan the year following and with the same success, with the exception of a few of the Providence that I planted amongst them; these did not fruit until the succeeding year, when they produced fruit double the size of the others. After this I was determined to try the natural system entirely in one of the houses. In March I planted strong suckers of the above-mentioned Pines, alternately with the Providence, the former to be fruited off the second year. I cleared the plants away as they ripened, to make room for the Providence, which require a year longer to produce fine fruit. I succeeded in this equally well; the smaller sorts fruited the second year and were cleared away; the Providence grew very strong and began to show fruit about the beginning of April. The third year, when I left my situation, I was informed that they produced very fine fruit, weighing from 8 lbs. to 11 lbs. From the experience I have had of this system I have not the least doubt of its success; and had I to grow Pines again, I have so high an opinion of it that I should never grow a Pine in a pot. Many Pine-growers imagine that there is a difficulty in getting them to fruit, but I found

none, no more than in the pot-culture. It is attended with little trouble; the saving of labour is very great, and there is also a saving in pots. From the time the suckers were planted to the time the fruit was cut the plants were never lifted, but a few of the lower leaves were removed and a little of the top soil was taken away and filled up again with fresh soil; this was done about March and again in September. Between these times I loosened the surface-soil occasionally.—*R. M., a Landscape Gardener.*

The Love Bird.—A correspondent wishes to be informed if the Love-bird (Agapornis pullaria) has been known to breed in this country; as, he says, a few years since three eggs were laid by a cage bird belonging to a lady at Cambridge who had kept these birds for a considerable period.

Larch Trees.—My attention has been called to a proposition which your correspondent, Mr. W. Billington, states interrogatively as to the propriety of falling Larch and other resinous trees in the early part of summer, on the ground that at that period "there is more of the resinous fluid afloat, or at least it is more regularly dispersed in the wood." I have frequently heard this idea broached, and am glad of an opportunity of contradicting it from experiment, as I have always done from theory, it being at variance with all correct principles. Every physiologist must be aware that the "resinous fluid" is a product of the plant itself, after the elaboration of the sap in the leaf, and, owing its existence to that elaboration, can only be met with in a descending or half-deposited state. We know that the first sap which rises in the returning summer unites with a portion of this deposit, causing the germination of the earliest buds; but in so doing, it only dilutes, not increases, the quantity of the last year's manufacture, so to call it; and by so doing only loads the timber with a quantity of water, the gradual evaporation of which after the timber is felled produces sun-cracks, and an evident predisposition to decay. If your correspondent will try the experiment, he will soon be satisfied of the error of this notion—which has become almost a popular one—that resinous trees should be felled in summer. Let a few Larch be cut down in March, and an equal weight cut in the following June or July (and it is by this that I have proved it), and let them be weighed against each other again, after lying in the timber-yard a twelvemonth; he will find that the summer-felled trees have lost weight against the others to a very considerable degree, besides the cracking and warping exhibited by all summer-felled timber. In fact, the sooner this opinion is exploded the better; for it arises from an entire want of acquaintance with the distinction between the rising sap, which (for our purposes at least) is little else than water; and the elaborated juice, or cambium, of the plant, which is, of course, most plentiful in the stem just at or before the fall of the leaf, and most effectually consolidated and dispersed in the timber in the winter. With regard to the latter part of the proposition, that it is at that period, viz., in June, "more regularly dispersed in the wood," the supposition is purely conjectural and empirical. Nothing can be more perfect or more equable than the disposition of its elaborated juice, which the plant itself has made; and the rising sap rather disturbs and deranges this disposition; of course, for an obvious and active purpose; which, however, being unfulfilled at the time of falling the tree, it lies in a state of arrested vegetable energy, so to speak, extremely favourable to early decay. Whilst I am on this subject, I am anxious to say one word on the pruning of resinous trees, about which such conflicting opinions are observed in the works on Arboriculture; some advising the excision of the bottom tier of lateral branches each year, but the generality forbidding all pruning whatever, and advocating their being allowed to prune each other by proximity. Like the umpire in the Fable of the Cameleon, I am obliged to say, "both are wrong." If one tier be taken off each year, it will be sometimes too much, sometimes too little, according to the growth and peculiarity of each tree; if they be allowed to prune each other, they leave dead snags sticking out in the stem, which the descending sap is obliged to surround, but which if cut off close to the stem it would have overlapped, and preserved from decay; and completing the annularity of that year's layer of new wood, would have made the timber stronger and more regular. Pruning is a matter not of rigid rules, but of principle. Let the pruner look at the internode above and below the branch in question; if the one below is considerably larger in girth than the one above, then the branch may come away with advantage, provided the plant be vigorous; and in the following year he will find the proportion between those two internodes of the stem more equable. If the two, or even three, bottom tiers have a disproportionately thin internode above them, and the stem be large and tolerably even in size between and below them, then those two or three tiers may all come away. But if the stem preserve a very regular proportion all the way up, then the tiers should only be taken off one by one, beginning at the bottom, as they begin to cease growing. If one branch of a tier, whether high or low in the tree, be exuberant, let a part of it be taken off. The best time to prune the resinous trees is either in October—with the view of the wound being covered by the turpentine before the frosts come,—or in March after they are gone, and a month or six weeks before the spring sap begins to rise, that the surface of the wound may have time to harden so as to destroy the elasticity of the mouths of the sap-vessels, and prevent the escape of the rising sap.—*C. Wren Hoskyns, Wroxhall.*

Domestic Yeast.—Persons who are in the habit of making their own bread can easily manufacture their own yeast by attending to the following directions. Boil one pound of good flour, a quarter of a pound of brown sugar, and a little salt, in two gallons of water for an hour when milk-warm bottle it and cork it close, and it will be fit for use in 24 hours. One pound of this yeast will make 18 lbs. of bread.—*J. Mc I., Hillsborough.*

Rats.—The great increase of rats in the present day is partly owing to trapping the domestic cat close to the labourer's cottage. I am, myself, no very great friend to the feline race; indeed, at one time, no animal ever raised the bristles of my temper half so frequently as poor puss; but since I began to place cheap netting over my newly-sown flower-beds, Tom and I have been on pretty good terms. Nevertheless, villages are ransacked, and in whichever direction you ride the sixpenny prize is too frequently exposed upon some wall or paling. Here we see the pied, the sable, the tortoiseshell, and the old maid's tabby, arranged as trophies of victory. What a deprivation must it be to the cottager on his return home from labour to miss the greeting of puss! how annoyed must he feel at no longer hearing his favourite purring round his legs! Many of our peasantry (thanks to an increasing love of gardening, and less frequent calls upon John Barleycorn) are now enabled to keep a pig; such at least was the case in the neighbourhood in which I sojourned during the past summer. The sty soon becomes infested with the above-mentioned vermin, which partake of the food given to the grunters, and if not destroyed they soon betake themselves to the hedges and ditch-banks in large hordes. We now see fields completely overrun by rats, and burrowed more like the works of rabbits than those whiskered gentry. The sportsman will doubtless argue that the cat, if once given to ramble, kills a large quantity of game; but I much doubt if the cat really destroys game equal to the rat, particularly in the breeding season; for the latter not only feeds upon the young birds, but also on the eggs of partridges and pheasants. These observations have been elicited by seeing several accounts in the *Chronicle* of the damage occasioned by rats; such statements at first appear almost incredible, but unfortunately there can be no doubt of their truth. I myself saw, only a few months back, hundreds of rats slaughtered in one field alone.—*A Quiet Observer.*

Polyanthus.—I found seedlings from Alexander very variable and uncertain. Those from Lord Rancliff generally resembled the parent, and there were many pretty varieties, but with small flowers. Those from Tantarara were like the parent. From Collier's Princess Royal I had round flowers with many petals; but by far the best were raised from fine-eyed seedlings, impregnated with Buck's George IV., Rancliff, or other good sorts. Among these I had varieties of all shades; and latterly I have saved seed from the fine-eyed ones only—propagating the best for that purpose, and nipping off the flowers from the named sorts when I have got their pollen. Loudon and others have said that this plant is much hardier than the Auricula: the very contrary is the fact; for in 1838 I saw both in a frame—of which many squares were out: the Auriculas all survived, and seemed little worse; the Polyanthuses were all killed. Over-potting is very bad for them; a little heat in early spring seems to help them to root; they should have timely attention in autumn to get them established early, and a situation kept regularly moist by shade and shelter from all drying winds.—*O.*

Dutch Clover.—The sudden appearance of Clover in pastures after some particular top-dressing, or in certain moors after the ling has been burnt, has often excited the surprise of observers, though perhaps without inducing them to make any accurate investigation of the circumstances under which it is produced; and it is probable that, in some cases, there has not been an acute discrimination of species. Observations by some competent person on this point would certainly not be without interest, and might lead to more important results than might at first be anticipated, both in a scientific and economical point of view. A still more curious and inexplicable instance of the sudden occurrence of a large natural crop of White Clover is that which so commonly takes place when large districts, as on the Lincolnshire coast, are rescued from the sea by embankments, and fertilized by the admission of the tide after the embankment has been completed, until the tract of country is in a proper state for cultivation. Some one conveniently situated for such observations, with a very slender botanical knowledge, but with a turn for patient and accurate investigation, would, by commencing from the moment of the final exclusion of the tide, most probably be able to clear up this very perplexing matter. As regards the appearance of Clover in pasture lands, there is by no means the same difficulty; for, not only will the seeds lie dormant for years where they are out of the influence of air from the presence of a thick vegetation above them, but it is very probable that in certain cases they may be propagated by the little tubers which are so general on the roots of Clovers, Vetches, and many other leguminous plants. These, indeed, in general appear to be mere reservoirs of nutritive matter, for they often run through their phases of developement very rapidly; but in other cases it is far from improbable that, when they are not demanded by the exigencies of the plant, they may be capable of reproducing it, as we know that such bodies may lie dormant for years. Everyone must have observed, after the periodical felling of woods, what a quantity of herbaceous plants appear, of which there has not been a trace for years, merely from the clearing of the surface of the soil from its thick coat of underwood. And this is not only the case with plants which spring from seed, but with others; as Orchidaceæ, which spring more generally from tubers. In certain woods which abound with the Fly Orchis, just after the periodical felling, not a trace is to be found for years after the underwood has once re-established itself. A very curious instance of the appearance of a plant hitherto unknown in the neighbourhood has lately fallen within my observation. An old tree was felled in a wild part of Rockingham Forest, and in the centre of the old stock, a single individual of Cynoglossum sylvaticum appeared, a plant which I have never before observed in this district, though acquainted with it from my infancy. A large crop has sprung up from this individual, and it is probable that it is now completely established. These and many other curious facts of a similar nature may occasionally excite our surprise; but it seems most unnecessary to have recourse to any notions so wild as those of spontaneous generation. The circumstance of the appearance of a species of Acarus during the course of certain chemical experiments instituted by Mr. Crosse, was laid before the French Academy, and they were, I believe, unanimously considered quite unworthy of attention as connected with the question of spontaneous generation. In the instances which have given rise to the present observations, there ought to be some pretence at investigation before explanations of such a nature be adverted to. For my own part, I should not think the appearance of a flock of sheep by spontaneous generation in the Lincolnshire marshes a matter at all more marvellous than that of a crop of Clover springing up without any pre-existent germs, for the adaptation of the several organs to the purposes for which the object was created does not show the wisdom and power of the Creator less in one case than the other.—*M. T. Berkeley.*

Gold of Pleasure.—An oil is expressed from the seeds. In France, brooms somewhat resembling our carpet-brooms, are made of the dry plant after the seeds have been threshed out.—*M. T. B.*

Ash-leaved Kidney Potatoes.—I bastard trench a piece of rich light sandy ground, about 18 ins. deep, and break it well with a spade. At the bottom of each trench is spread some half-decomposed horse-dung, about four inches deep, and on this I plant the sets whole, cutting a small piece of the narrow end off, as I consider it is useless, and placing them upright, the ground is planted as the trenching proceeds; the tubers are laid in lines fully nine inches deep and nine inches apart in the rows, which are 18 inches from each other. I cover the surface of the ground for about three inches deep with dung, similar to that which is put into the trench. They receive one moulding up when the Potatoes are about six inches high; a little damaged salt is mixed with the soil which causes the Potatoes to be well flavoured. By adopting this plan an excellent crop may be produced early in June if the tubers are planted between the 25th and 30th of January. In taking up the crop select the best ripened ones, and let them be thoroughly dried in the sun until they become shrivelled; these will always come earliest.—*Anonymous.*

Reviews.

The Botany of the Voyage of H.M.S. Sulphur. Edited by R. B. Hinds, Esq.; the Botanical descriptions by George Bentham, Esq. 4to. Part I. Smith, Elder, and Co.

The voyage of the Sulphur occupied a period of six years, during which time the south-east of South America, the whole of the west coast of that continent, some of the islands in the Indian Archipelago, and eventually the coast of China were visited. Mr. Hinds, who was the surgeon of the expedition, was a zealous naturalist, and lost no opportunity of forming collections, especially in Conchology and Botany. His Herbarium was placed in the hands of Mr. Bentham, and the new plants which it contained are to be published in the present work, under the authority of the Lords of the Admiralty, the Botanical descriptions being written by Mr. Bentham, and the general observations by Mr. Hinds, whose attention was particularly turned, during the whole voyage, to Botanical geography.

The Number before us contains the commencement of the Californian Flora, and is illustrated by 10 lithographic plates of remarkable plants of merit. Mr. Hinds gives a graphic account of the general nature of the vegetation, and especially of the Russian settlement of Sitka, which we must extract.

"The number of rainy days in the year is very great, and at Sitka only 37 really fine clear days were recorded throughout this period. At this Russian settlement some extended observations gave the mean temperature of the year as 45° 5′, and the range from 2° 3′ to 81° 9′. The whole country is bold and mountainous, intersected by deep and moist valleys, and is everywhere covered by a gloomy forest of Spruce. These vast forests offer a scene which powerfully arrests attention. The trees are often of enormous dimensions; stretching upwards, with scarcely a branch, to where the eye almost fails to follow them, with enormous trunks, very deceptive till brought within the scope of our experience by means of the tape line; beneath, a most luxuriant undergrowth everywhere abounds, and has an exuberance and charm about it which is rarely supposed to be possible beyond the tropics. But over these the influence of the moist climate is unceasing. It most probably hurries through a rapid existence the more lowly shrubs, and its effect on the trees is very marked. None are seen to attain any great age, that is, none have that appearance; but when the vigour of life is past, they rapidly yield to the constant influence of the moist atmosphere, soil, and investment of Mosses and Lichens, and soon fall to the ground, which in some places they occupy in great numbers. But as is everywhere observable where the climate is uniform, the variety in species is not great; and some will occur with multitudes of individuals covering a very large space.

The account of Upper California is not less interesting.

"It was late in the autumn of 1837, when an expedition up the Rio Sacramento penetrated from San Fran-

coast a great distance into the interior. The country consists of a vast plain, rich in a deep soil, and subject to periodical submersion. Occasional clumps of fine Oaks and Pines imparted an appearance of park-land. They were already shedding their leaves; a small Grape was very abundant on the banks, and we sometimes obtained a dessert from the fruit of a Juglans. We had scarcely returned, when a storm covered the mariti me range of hills with snow; and this set the final seal on the year's vegetation. On quitting the coast for the interior, we entered amongst the evergreen Oaks for deciduous species. The latter grow to fine trees, with wood of great specific gravity. But the natives have a very pernicious practice of lighting their fires at the bases; and as they naturally select the largest, it was really a sorrowful sight to behold numbers of the finest trees thus prematurely and wantonly destroyed. And it is not a country where wood is superabundant; for no sooner is the Oregon crossed than the Spruce forests disappear, and the prevailing trees are Oaks, which towards the south become gradually less abundant."

From this account it will be at once perceived that Mr. Hinds' work is worthy the support which it receives from the British Government. We trust that the same liberal assistance will be granted to Dr. Joseph Hooker and his ample materials for an account of the Botany of the late antarctic voyage of the Erebus.

It was very laudable in this officer to take upon himself duties to which he was not liable, and the Botanical world owes him a debt of gratitude for his meritorious exertions. The public, however, has a right to expect that those collections of plants which were formed at the public expense, and which are now supposed to be buried in the British Museum, should be also made use of. We trust that the Lords of the Admiralty will take measures to rescue them from their lurking-place, and cause them to be placed in the hands of Mr. Bentham, than whom it is impossible to find a Botanist better qualified for their examination. The collections to which we allude were formed by Mr. Barclay, and we believe Mr. Sinclair also, the former of whom was sent out at the public expense and the forming such collections was part of his duty.

NOTICES OF NEW PLANTS WHICH ARE EITHER USEFUL OR ORNAMENTAL.

STATICE RYTIDOPHYLLA. Rasp-leaved Shrubby Sea Lavender. *Hardy Greenhouse Plant.* Plumbagineæ. Pentandria Pentagynia.—This is a very beautiful species of Statice, and easily cultivated as a hardy greenhouse plant; but of its history I regret to say I can get no satisfactory information. The Royal Gardens at Kew are indebted for the possession of it to Mr. Low, of Clapton; and it exists in several gardens under the name of S. Dicksonana. Mr. Mackay, of Dublin, informs me that he raised it from South African seeds, given him by Mr. Harvey, and that he understood it to have come from Port Natal. But I find nothing of the kind among my own specimens from that part of the country, and although Mr. Harvey is aware that he brought to Mr. Mackay seed from the Cape of Good Hope, he had no reason to suppose that the collection contained any from so distant a region as Port Natal. Respecting its native country and introduction we must still remain in doubt; but there can be no question about the beauty of the species, or its merits as a standard plant for cultivation.—*Curtis's Botanical Magazine.*

LUPINUS ARBOREUS. Field Peruvian Lupine. (*Half-hardy Biennial.* Leguminosæ. Diadelphia Decandria.—This is a grey little plant, forming one more addition to the large genus Lupinus. The flowers are rich bright lilac, enlivened by a yellow spot. In number the leaflets vary from 5 to 9. The seeds, by which Lupines may be distinguished more accurately than by the ordinary marks employed by Botanists, are oblong, smooth, and mottled with grey of different tints. It is a half-hardy biennial, growing from one to two feet high, and flowering a great part of the summer and autumn. Like other Lupines it requires a strong rich soil, and, though a half-shrubby biennial, is best treated as an annual. The seeds should be sown about the beginning of March, in pans filled with a loamy soil, and when large enough should be potted, placing three plants in a small pot; afterwards, when the danger of the late spring-frosts is over, they may be planted out in the open border. The seeds may also be sown in the open border about the middle of April, but then the plants flower much later, and are never so fine as when treated as above stated. It was found growing in corn fields near Loxa, in Peru, by Mr. Hartweg, and flowered in the garden of the Horticultural Society in the course of last autumn.—*Botanical Register.*

TURNERA LOBATA. Lobed Turnæa. (*Stove Perennial.*) Melioceæ. Monadelphia Decandria.—This very rare Stove-plant flowered at Chiswick House last July. His Grace the Duke of Devonshire received it from Mr. Whitfield, who collected it in Sierra Leone. The flowers have much the appearance of those of the Orange, but have no smell. The nearest affinity of this plant is evidently with the T. heterophylla of Smith, a species from the same country, and apparently very like it. But Mr. Bennett, in his revision of the genus in Horsfield's "Plantæ Javanicæ," p. 84, places T. heterophylla in a section, having from ten to twenty cells to the ovary: this, however, has most certainly only five cells with two ovules in each.—*Botanical Register.*

GARDEN MEMORANDA.

Royal Botanic Garden, Regent's Park. — Several structures for plants have lately been erected here. A span-roofed house about 42 feet long and 16 wide has recently been put up; this is in two divisions, one of which is chiefly devoted to the culture of Orchidaceæ, the other is filled with Palms. Several species of the former were in bloom; among them was a conspicuous and well-grown specimen of Phajus grandiflorus, and a plant of the pretty purple-flowered Bletia verecunda; Sobralia sessilis was just coming into bloom, being the fourth time of flowering this season. In this house was the old Stanhopea grandiflora, producing a fine spike of flowers; this, as well as several other plants, was growing in a basket that tapered to a point at the bottom, something like an inverted cone. These baskets are made of pieces of Hazel fastened round a common centre at the bottom, and radiate outward towards the top. The principal advantages of this shape are, that the flower-stems of Stanhopeas and others that bloom in the same way readily pass through to the outside, and any drip, being always from the point of the basket, can be easily prevented from falling on other plants. A specimen of the larger variety of Maxillaria aromatica was particularly remarkable, on account of its bright orange flowers and agreeable fragrance. Here was also a case filled with plants that had lately been imported from Jamaica. Among them was said to be a species of Ipomœa, resembling in appearance I. Horsfalliæ, which we were informed grows abundantly in the woods in Jamaica. There was also in the same case a Podocarpus, a tree remarkable for the beauty of its wood. This house is heated by hot water in iron pipes. Near it were several ranges of pits; one of them, heated by hot water, was filled with Greenhouse plants, among which were good specimens of Heaths and Epacrises. Passing through a second span-roofed house, 64 feet long and 16 wide, which was filled with half-hardy plants for bedding out in spring, we entered an old stove near it, which contained a few Cacti, and a collection of other plants, along with two bulbs of Ornithogalum revolutum, being part of a large importation of Cape bulbs. In the American garden was a bed of Andromeda floribunda, covered with flower-buds; this about April and May will be a sheet of white bloom. Here were also several plants of Rhododendron Russellianum; this scarlet variety is perfectly hardy; but they had mats thrown round them to preserve their foliage; the Rhododendrons are intermixed with Ledums, Vacciniums, Heaths, Andromedas, &c. Extensive additions, Mr. Marnock informed us, are soon to be made to the general collection, and also to the Medical garden.

The Naturalist's Corner.

Virgil on Grafting, &c.—It seems impossible not to observe the beautiful manner in which Virgil has described the ingrafting and inoculating of trees, in his Second Georgic. The variety of expression which he has used in speaking of the different sorts of ingrafted trees, and the various epithets he bestows on them, render the passage exceedingly delightful. The Arbute is distinguished by its ruggedness; the Plane by its barren shade; and the Pear by its snowy blossoms. It would have become a prose writer simply to have said, that any scion may be ingrafted on any stock; but a poet must add beauty to his instructions, and convey the plainest precepts in the most agreeable manner. Thus, Virgil, after he has said that Walnuts are ingrafted on Arbutes, Apples on Planes, and Beeches on Chesnuts, adorns the wild Ash with the fine blossoms of the Pear; and, instead of barely telling us that Oaks may be ingrafted on Elms, he represents the swine crunching Acorns under Elms, than which nothing can be more poetical. At the close of the passage, he gives life and sense to his ingrafted trees, making them wonder at the unknown leaves and fruits with which they are loaded.—*Professor Martyn.* [All this may be very well for a poet, but it would have been none the worse if there had been a little common sense it it.]

Manchineel.—The fruit and the juice of this tree (*Hippomane mancinella*) are exceedingly acrid, and the latter was at one time made use of by the French colonists in America, for the purpose of inflicting a most barbarous torture upon their slaves. The scourges with which they lashed those unfortunate creatures were prepared by being steeped in the juice of Manchineel, and thus every blow inflicted caused the same agony as if the scourge had been red-hot iron.

Miscellaneous.

Condensation of Carbonic Acid by Charcoal.—The cells of wood-charcoal have a diameter of about $\frac{1}{24\frac{1}{10}}$ of an inch, and if a cubic inch consisted entirely of cells, their united surface would amount to 100 square feet. By experiment it can be shown that the cells constitute $\frac{5}{6}$ths of the whole cubic contents of the charcoal; and allowing for the space occupied by the charcoal, the actual surface of the cells will be about 73 square feet. When charcoal is plunged into carbonic acid gas, it absorbs into its cells no less than 56 times their cubic contents at the ordinary temperature and pressure, and consequently the gas is condensed to 56 atmospheres. But according to the experiments of Addami, carbonic acid liquefies under a pressure of 36.7 atmospheres, and we are hence compelled to conclude that above one-third of the carbonic acid which is condensed on the walls of the cells is in the liquid state.—*Mitscherlich, in Polytechnic Magazine.*

Elm-trees upon the Boulevards of Paris.—For many years these beautiful trees have been suffering, and it was supposed that this was owing to the attacks of the Scolytus destructor. There is, however, now some reason to suppose that it has arisen from the too great proximity of gas-pipes. On opening one of these, it gave out an exceedingly offensive smell; and plants of Wheat, Barley, &c. planted in the soil surrounding the pipe, soon ceased to grow. The roots of the trees in the soil were blackened, and gave out the odour of the gas, which was very offensive.—*Bot. Zeit.*

CALENDAR OF OPERATIONS

For the ensuing Week.

I.—HOTHOUSES, CONSERVATORIES, &c.

Any new plant that flowers in winter is doubly valuable. Clerodendron splendens, Centradenia rosea, and Manettia bicolor are of this class: the Manettia requires less heat than the other two; they will do well in an intermediate stove, and flower freely in a conservatory with 45° of heat. Dendrobiums that have had their shoots well ripened last autumn will soon be beginning to bloom; some of them might now be forced, and others removed to a cool place, and kept dry, in order to prolong their flowering season. Maxillaria aromatica ought to be grown largely for forcing: it is one of the easiest to cultivate. A few Stanhopeas might also now be forced. All of these plants that have been kept over through the winter should be plunged in tepid water, to soak the moss or peat, &c. in which they are grown, preparatory to regular watering. It is yet too soon to encourage plants in general to grow; many would be benefited by a layer of fresh soil or top-dressing; give large portions of air on fine sunny days.

Conservatory.—Established plants here should about this time have the surface soil stirred on the top of the pots. The surface of the borders should now be removed altogether, the soil stirred with a fork a few inches deep, and a layer of fresh earth laid on; more air should be given for the first week after this operation, to sweeten the house. Fast-growing climbers that exhaust the soil in a few years, and become stunted, ought to be transplanted now into fresh soil. Ipomœa Learii always flowers best when young in fresh soils.

Greenhouse.—As large portions of air are admitted, more attention to watering is necessary; many greenhouse plants would be much benefited if they could now be turned out into cold pits where frost could be kept from them; our long nights are not favourable to very early spring growth; indeed, nothing can be more injurious to many woody plants than to allow or encourage them to grow early; soft-wooded plants that are annually cut down or close-pruned do not suffer so much from growing out of season.

Forcing-Pits.—There is a good deal of room for speculating on the causes which render plants liable to the attacks of insects. In the forcing-pits we see hardy plants infested on which an insect is never seen in the open air. Moist heat being essential for these pits, but watering is needed: over-watering is a great cause of failure in forcing plants, and a dry atmosphere and sudden changes are nearly as bad. Primulas, Auriculas, Anemones, Pæonies, and almost all plants that flower in April, May, and June out of doors, will force and flower two months earlier if not put into too much heat at first. The whole race of papilionaceous plants will force with less risk than other tribes. It is a good rule to submit all spare ornamental plants to winter or spring forcing.—*D. P.*

II.—FLOWER GARDEN AND SHRUBBERIES.

Out-door Department.

In gardens where the ground was thrown up rough in the autumn, it will by this time be pretty well mellowed: and therefore, as the weather is dry, it would not be amiss to dig the beds over again, so as to bring some more of the soil under the direct action of the atmosphere. Where the ground is poor, enrich it by adding some rich compost, such as leaf soil, peat, and loam, mixed together, but avoid fresh stimulating manures, or you will have strong rampant plants at the expense of a fine show of flowers.

Shrubberies.—If other work has been got pretty forward for the spring, a few days or weeks might be advantageously spent in regulating the shrubs, such as tyeing mis-shapen plants into good forms, pegging down branches to get the naked ground covered, and planting a few evergreen trailing plants where such are necessary. Examine your landscape scenery, and see whether, by taking down a tree here and there, or lopping a few branches, you cannot let in a distant object or two that may be worth seeing.

Pits and Frames.—Scarlet and other Pelargoniums planted out in pits for the winter may be potted, and placed in a little heat. The first opportunity, make up a gentle dung-bed for a propagating frame, so as to get to work in earnest, and without any further delay.—*W. F. A.*

III.—FLORISTS' FLOWERS.

The weather is extremely trying to Pansies, Auriculas, Polyanthuses, &c. &c., as this season they will not be so well able to withstand severe cold, not having been inured to it by previous frosts. Florists' flowers grown on beds, such as Pinks, Pansies, &c. &c. may be most advantageously sheltered, by the insertion of small branches of Spruce Fir, about nine or ten inches in length, which not only allow a free circulation of air, so essentially necessary to the well-being of these plants, but at the same time protect them from cutting frosty winds, which all florists know (to their cost) are so highly detrimental.

Tulips.—Attend to the directions previously given; whilst this weather continues, they are going on as well as they can do.

Polyanthuses.—Last week we observed that these plants do best on beds. We have also blamed them exceedingly fine, by growing them in garden pots, which were placed within others of double size, the space between the two pots being filled with damp Moss, thus keeping the roots secure from those occasional droughts, so trying to the red spider, which may truly be said to be the greatest pest these plants have to contend with.

Carnations.—As the time is rapidly drawing on for potting out, look well to your compost heaps; turn them often, and particularly in frosts. Examine your turfy loam, break all the lumps with the back of the spade, and though not made in vain, destroy without mercy every wireworm you see. It is bad economy to be unwilling to pay attention to your soil, as a single insect or two of any description will often destroy. Carnations to a serious amount it overlooked. Should a frost ensue, gather cow-manure from the pastures, pile it in heaps, to decompose; and, in fact, all vegetable refuse ought to be collected whenever opportunities offer.

Dahlias are now being forced, to obtain early cuttings where a large stock is wanted.—*J. F. W.*

IV.—PINERIES, VINERIES, &c.

Pinery.—The temperature of the fruiting-pit should from this time be raised one or two degrees a-week till it is 70° by night and 75° by day, thereby raising the humidity of the atmosphere proportionately. Be particular to have the bottom heat between 80° and 85°. Plants that are now showing fruit, and that are to remain in pots, will be benefited by having some pieces of fibry turf placed in contact with their roots on the surface within the pots, and well up round the collar of the plants, first removing any of the soil that may be fading, and a little of the old soil in repotting any of the succession plants that have lost their roots from too much moisture, or other cause, use the soil in a rough fibry state, and as free from sourness as possible. The linings of the pits heated by means of fermenting material will require strict attention now. Keep them dry, and be prepared always with a piece of covering for the roof of your pits, to obviate the injury from sudden decrease of temperature.

Vinery.—During the time the Vines are in bloom, avoid syringing, except on the stem, which should be kept moist. Tye in the shoots as they advance, allowing room for them to swell, and stop the laterals. Endeavour to keep the covering upon the border quite dry, as nothing can be more injurious than to have the roots chilled by drenching cold rains. It is now time to shut up the succession house; see that the lights are in a clean state, and that these should be pruned, if not already done; any fruit that yet remains should be hung up in a dry cool room.

Peach house.—During the mild weather we have hitherto had, the trees in the succession-house will have been advancing without fire-heat; and it is now time to make slight fires; when the temperature falls below 45°, syringe frequently. Continue to thin the shoots on the trees in the first house; and now when the fruit is set, use the syringe freely.

Fig house.—Keep a moist, genial atmosphere, and syringe with soap-suds twice a week, to destroy any insects that may be about the buds.

Melons.—As there are many amateurs and gardeners who have

not the advantage of a pit for growing their Melons, the following way of forming a bed may be new to some, and will be found a much better one than making it wholly of dung, as it will not sink so much, nor take so strong a lining to keep up the heat. Mark off the size of the bed on the ground one foot longer and wider than the frame, then build up to this size, with faggots of stout brushwood, to the height of two feet, first lay a row of faggots, 18 inches in diameter, along the back, front, and ends, for the frame to rest upon, placing them close and firm, leaving the interior space to be filled up with fermented dung and leaves as a foundation for the sod. The latter should be two feet in depth at least.—*G. F.*

V.—HARDY FRUIT AND KITCHEN GARDEN.

Rotation of Cropping.—It is now necessary to determine what the different quarters of the garden shall be filled with during the season. Though one vegetable may be grown on the same ground for years, yet such a method involves a greater expense for manure and labour than when a regular system of rotation is adopted, as the culture of one vegetable often prepares the soil for the growth of another. The chief rule to be observed with all annual vegetables, is never to have two crops of the same class directly following each other. Though excellent plans of rotation may be laid down, yet the period that will elapse before the ground is again occupied by a similar crop will depend upon the wants of the establishment and the quantity of ground at the disposal of the gardener. Those who require to have several crops on the ground at the same time, will find that Celery gives a good preparation for Carrots, Turnips, Parsneps, Onions, and early Cauliflowers, or for Peas, with Potatoes and Winter Greens, or Broccoli between the rows. Autumn-sown Onions may be succeeded by Spinach, Lettuce, &c., and early Cauliflower by autumn Onions. Spring-sown Onions will be advantageously succeeded by Cabbages in beds, with Scarlet Runners between; and if the Cabbages stand all summer and next winter, the ground will come in, in the spring, along with Broccoli-ground, for Celery, Potatoes, and Peas, the early Potatoes being planted in the trenches, and the Peas sown on the ridges.

Peas and Beans.—Sow a quantity in a little heat in pots, or on turf, to turn out in the middle of March.

Radishes, Carrots, &c., may be sown on a warm border, and covered up with litter. The weather is now so very changeable, that instead of planting or sowing much, it will be more advisable to get all the ground at liberty in good order by frequent digging, ridging, &c.—*R. F.*

VI.—ARBORICULTURE.

Old Woods.—Under this head proceed with the works as directed in previous Numbers.

Coppice.—Refer to the directions of last month, and perform all necessary works in due time.

Young Plantations.—Attend to training, relieving, and thinning, as directed last month, from the second or third year after planting till the trees attain the height of 15 or 20 feet. Many people imagine that after the trees are planted they require no more attention for several years, but this is a great error.

Hedge-rows.—As many persons will now be putting their fences in order, and planting trees in hedges, some would, perhaps, like to know what kinds should be preferred; but this depends entirely upon the soil and locality—those kinds that would succeed in one place might not do so in another. In sheltered situations and in dry soils, the Walnut, the Locust tree, the Gean or Wild Cherry, the Hagberry or Bird Cherry, and Mountain Ash will do well; but the Oak and Spanish Chesnut require a good soil. The Scotch Fir and the Larch thrive on high situations; the roots of these run near the surface, and are injurious to arable lands. Compact upright growing Elms answer for hedge-rows, but not the Forked Wych or Scotch Elm, yet even that might answer, if properly trained. Ash should only be planted in pasture or meadow land.

Nursery Work.—Having previously alluded to the injury done to young trees in nurseries and plantations by hares and rabbits, the following is a simple and cheap method I have used for several years to save young Apple and Locust trees from them, but this process will not answer in extensive plantations.—I make a mixture of cloacine (fresh night-soil, rather in a liquid state, but if that cannot conveniently be got, fresh thin cow-dung, soot, sifted coal or wood-ashes, diluted with strong soap-suds to the consistence of yeast, may be smeared over the stems and branches, as high as the hares or rabbits can reach, with a brush made of Ling (Heath) thrums, or Wheat-straw with the ears on. This should be applied early in November, or before severe weather sets in; it should be laid on pretty thick, once or twice, on a dry day. It will secure them for one winter. No danger arises from it, and it will wear off in spring. Many choice shrubs and flowers might be preserved by sprinkling them thickly over with this mixture early in winter.—*W. B.*

VII.—COTTAGERS' GARDENS.

As the weather within the last few days has been very changeable, the cottager should pay particular attention to protecting everything that is likely to be injured by frost. When the nights are sharp and cold, all the plants should be drawn back from the window, or set down on the floor of the room. Pelargoniums, owing to the late mild weather, will now be handsome bushy plants, if they have been well treated, and must be carefully watched; if they incline to grow up weak and slender, the points of the shoots may be nipped off; they should be watered sparingly and allowed to have plenty of air every fine day. Daphne odora rubra makes an excellent window plant, and may be made to bloom freely at this season if it is treated as follows. A plant of it, I am informed, was potted last spring in coarse rich loam and charcoal; about the beginning of June it was turned out, in the pot, into a shady border until it had finished its growth. In the middle of August it was put, still in the pot, into a border due south, where the wood got well ripened; it was taken up in November and placed in a window. It is now looking very healthy and has 11 bunches of flowers on it. This plant is grafted like a standard Rose, about 14 inches high.

Vegetables.—If not done last week, a sowing of Radishes may be made on a warm border if the weather is favourable; but the beds must be carefully covered in severe weather, as directed in last week's Calendar. Vacant grounds, if any, may be dug, and everything that will forward the spring work should now be done before that busy time arrives.

Fruit.—If any fruit-trees still remain not pruned, it is not yet too late to perform that operation, taking care to keep the branches thin and regular.

Flowers.—This changeable weather is very unfavourable to flowers, and they will require much attention. If severe frost sets in, China Roses, &c. trained on the cottage should have some protection, for being in a forward state, they will be injured by it. Spring-flowers, as Anemones, Tulips, &c., if any, must also be looked after, and protected with hern or straw.—*Mell.*

State of the Weather near London for the week ending Feb. 1, 1844, as observed at the Horticultural Garden, Chiswick.

The highest temperature during the above period occurred on the 11th, 1831—thermometer 65°; and the lowest on the 5th, 1838—thermometer 20°.

Notices to Correspondents.

Our Correspondents will oblige us by not mixing together Agricultural and Horticultural questions, and by writing them on one side of the paper only. Such precautions can give them no trouble, and will save us a great deal.

Communications from the following Correspondents are in type, and are only waiting till room can be found for them:—*A Practical Man, P. Mackenzie, J. Wighton, O., M Power, H. Groom, A Friend to Floriculture, Nemo, J M'L., M. T. B., J. W., J. L. Snow, G. Thompson, I. W. K., Vitis, W. Billington,* and *Martin Doyle.*

Amphicome arguta, &c.—*A. Scot.*—This may be potted in loam and peat mixed with a little sand; Astelma Stæhelina will succeed in turfy peat, mixed with sand; both of these are greenhouse plants, and will flourish in a temperature from 40° to 50° in winter; but Cypripedium venustum and Gesnera faucialis require a temperature of about 65° at that season, and therefore cannot be grown among greenhouse plants.‡

Asparagus.—*A Renter.*—You may apply during the ensuing spring to Asparagus beds in a bad condition, both salt and the mud you mention from a pond formed by farm-yard drains and house-sewers.‡

Auricular.—*A Novice.*—Top dress with leaf mould, cow-dung, and sand, equal parts. Try one or two with superphosphate of lime instead.

Azaleas.—*An Amateur.*—The following are 12 distinct handsome hardy hybrid Azaleas, viz.:—eximia, lutea rubicunda, coccinea nobilis, Gloria Mundi, incarnata maxima, regalis, amabilis, Govenia, thyrsiflora, Aurora, dulcedo, blandina.¶

Books.—*An Old Subscriber.*—"Mackintosh's Practical Gardener."—*W. J.*—"Glendenning on the Pine," and the last No. of the "Gardeners' Magazine."—*S. N.*—The "Theory of Horticulture."—*A Novice.*—"Turner's Chemistry." You should read Sprengel's papers, as translated in our columns. Lime drives off ammonia.—*W. E. C.*—You should apply to Mr. Sowerby. We do not know.

Celery.—*Moderator.*—In order to get this early, without much risk of the plants running to seed, it should be sown in shallow pans about the beginning of March, and placed in heat until it forms its first leaves, when it should be pricked out into a cold frame, and remain there until May, when it may be finally transplanted into the open ground.‡

Coppice.—*L. C. P.*—You may plant any time up to the end of February. The best time is in the autumn. The better the soil is prepared, the faster the trees will grow; but single trenching, if the drainage is good, is enough. Without perfect drainage, it is useless to plant anything better than Alders and Willows. No manure is required; but if you could pare and burn the whole field in the course of next summer, you would gain much more than you would lose by waiting one season. Oak, Ash, Hazel, and Bird-cherries, are what you must chiefly rely upon.

Chrysanthemums.—*An Amateur.*—The following are good kinds, viz.:—formosum, Duc de Canegliano, Therese, Eclipse, Beauty, Grand Napoleon, Princess Maria, Minerva, Goliath, Vesta, Queen, lucidum.¶

Fossil Ferns.—*C. R. Bree.*—The belief in the existence of gigantic fossil Ferns in the coal measures is founded upon the existence there of Sigillarias, an extinct form of vegetation of considerable size, which Adolphe Brongniart has referred to Ferns. But this has long ago been shown, in the "Fossil Flora," to be a conclusion entirely unsupported by evidence. It is true that the ingenious French Botanist has attempted to prove his case by a long and elaborate argument; but if such reasoning as he employs in doing so is to be admitted, then anything may be proved. In fact, we believe that Adolphe Brongniart has himself changed his opinion, and admitted his error. It is true that a few fragments of real Tree Ferns are found in the coal measures, and have been distinguished by Lindley under the name of Caulopteris, but there is nothing gigantic about them; they are, in fact, exceedingly like Tree Ferns now inhabiting the tropics.

Fruit-trees.—*A Subscriber.*—The ground which you have allotted for a small orchard, 30 yards square, will contain, at 6 yards apart, 10 Apple trees, 10 Pear, and 5 Plum-trees. They may consist of the following varieties:—*Apples*—Ribstone Pippin, Blenheim Pippin, Claygate Pearmain, Dutch Mignonne, Golden Reinette, Sturmer Pippin, Court-pendu Plat, Alfriston, Wormsley Pippin, and Dumelow's Seedling. *Pears*—Marie Louise, Bacon's Incomparable, Beurré Diel, Knight's Monarch, 2 Glout Morceau, 2 Passe Colmar, 2 Beurre Rance. *Plums*—Royal Hative, Orleans, Green Gage, Purple Gage, and Washington.¶

Greenhouse Climbers.—*S. H.*—The following are suitable for covering the back wall of a greenhouse 30 feet long and 10 feet high, viz., Clematis azurea grandiflora, C. Sieboldii, Cobæa scandens, Maurandya Barclayana and Kennedya Marryattæ.‡

Hardy Plants.—*L. M. C.*—The following plants are suitable for an open border, and may be easily obtained, viz.:—Pæonia Moutan, white, 3 feet high, flowers in March and April; Thermopsis fabacea, yellow, 3 ft., flowers in May and June. The following 12 flower in October and November:—*Red:* Betonica serotina, 1 ft.; Eupatorium trifoliatum, 2 ft.; Aster Novæ Angliæ ruber, 3 ft. *White:* Gnaphalium margaritaceum, 1 ft.; Aster diffusus, 2 ft.; Aster lævis, 3 ft. *Blue:* Statice Gmelini, 1 ft.; Stenactis speciosa, 2 ft.; Aster Novæ Angliæ, 3 ft. *Yellow:* Rudbeckia hirta, 1 ft.; Gaillardia aristata, 2 ft.; Pascalia glauca, 3 ft. August and September—*Yellow:*—Gnaphalium arenarium, 1 ft. The kinds of Perennial Aster that flower up to Christmas are handsome, but they are generally injured by frost, and become unsightly before that time. Iberis semperflorens is quite hardy and handsome; it does not flower all the year round. Saxifraga ligulata flowers in May; its blossoms are nearly white, with a slight shade of pink; it grows about a foot high, but is not a hardy perennial. Helleborus orientalis keeps in bloom from December to February; Anemone hortensis flowers in May; Arabis rosea will bloom early in January; Andromeda floribunda puts forth its pretty white blossoms in March and April; Lathyrus magellanicus has blue flowers; being rather tender it succeeds best when treated as an annual. There are some Narcissi that flower in September. *N. viridiflorus.*¶

Heaths.—*An Amateur.*—The following are 12 distinct hardy Cape Heaths, for flowering during the summer months, and they may be easily procured, viz.:—Bowieana, white; grandiflora, yellow; ventricosa, pink; echiiflora, purple; Beaumontiana, blush; mundula, pink; ceriuthoides, scarlet; ampullacea, aristata, dark, crimson, and pink; aggregata, purple; viridiflora, green; and hyssodes, white.¶

Hibiscus.—*J. W.*—Your seedling plants of Hibiscus, that have lost their leaves from damp and the effects of green-fly combined, may be cut down and placed in heat; they will start away again from the root. They are not difficult to raise from seed; but many of them are stove plants, and require a higher temperature than that of a greenhouse. Your Cactus cuttings may be separated from the parent plants in March.‡

Leycesteria formosa.—*F. E.*—This plant was introduced in 1824. It is a native of the Himalayan Mountains, and is handsome, but its flowers are not very conspicuous. It is perfectly hardy, and forms good cover for game, as pheasants are fond of its berries.‡

Manures.—*A Subscriber* may use guano at the rate of one lb. to 4 gallons of water for watering Pines and other plants. Charcoal mixed with the soil has a beneficial effect on Pines and greenhouse plants.‡

Melons, &c.—*L. B. V.*—You cannot grow Vines and Melons with advantage in the same house, when the Melons are to be trained on a trellis under the lower lights and the Vines over the upper ones; but Musas and other tropical fruits that will bear a uniform temperature, and that you wish to grow, will succeed very well on the back part of the house, where there is a stage 3 feet wide with a tank under it. When the Melons have done bearing, their place may be filled by Cucumbers during winter. In the same house you may also force kidney Beans.‡

Names of Plants.—*Eden.*—Your Syrian plant is some kind of Cyclamen which we do not recognise. Keep it as a greenhouse, while in flower, at this time of the year, and place it out of doors in a warm sunny place during summer. Bring it back into the greenhouse when the rain and cold of autumn commence. Few directions have yet been given for pruning, except incidentally. Some very good ones are to be found in the "Cottage Gardens" of 1841, especially Nos. 41 and following.—*A Botanist.*—Hypnum rutabulum, pray do not ask us to name Cryptogamic plants having no relation to gardening.—*Taggos.*—The yellow variety of Maxillaria variabilis—*E. M.*—Æschynanthus grandiflorus.—*D. W.*—The Cashew Nut.—*Lepus.*—Your seeds certainly belong to Sonchus oleraceus; but whether it is palatable to rabbits we do not know. Most likely. It is an old-fashioned pot-herb.

The Olive.—*J. N. V.*—The seed of this plant will not keep, and therefore cannot be sent to great distances. It varies in quality, but not so much as Apples. The best of the cultivated kinds are those of the north of Italy; the worst the Spanish. The wild Olive is very inferior, and of little value. The only certain way of sending Olive-trees to the most distant colonies is in Ward's cases, in which they will travel for six or seven months without care and without injury. They may be had of Messrs. Loddiges. The finest trees are said to be those which grow in moist rich soils, but the best oil is reputed to come from the warmer chalky districts. In the Olive countries the tree is propagated by truncheons chopped off the stools, with a few roots adhering. It may also be increased readily by layers. Such plants are said to fruit in two or three years. We do not know how long seedlings are before they bear, but probably several years.

Orange-trees.—*A. Z.*—Your Orange-trees may be repotted in March. A rough soil, consisting of two thirds sandy loam and one of fibrous peat, will suit them best. The pots should be well drained, and charcoal, or if that cannot be procured, brick-rubbish may be freely mixed with the soil. Orange-trees should be placed out of doors during summer and autumn, when they require no further care than to attend to them with water. In winter, when in doors, they may be managed like other greenhouse plants. They like the very strongest manure.‡

Orange-tubs.—*A Subscriber.*—To paint the inside of these with pitch, not coal-tar, is not injurious to the plants, and it renders the tubs more durable than they would be without it.‡

Pseud-Acacia.—*D. C. L.*—This will bear cutting down very well, and throws out a quantity of brushwood where it is cut, but it will not form a thick strong underwood capable of keeping trespassers out of plantations.‡

Transparent Calico.—*Subscriber.*—Just tack your calico to your frame before you apply the composition; when it is dry it will become slack. Then unfasten it, strain it tight, and secure it. Most likely it will want a second coat of composition. We have no idea that the substance you mention is so good as Whitney's, which is the most transparent that we have seen.

Vines.—*A. B. C.*—When the fruit is cut, the Vines in your late Vinery should be pruned immediately, and successively as the crop on each Vine is cleared off. Having Pine-apples and Vines in the same house, you cannot do justice to both, and obtain a late crop of Grapes, without the means of turning out the Vines, which you say you have not. If the sashes were made to slide there would be no difficulty; for the lower ones could be drawn up so far as to admit of the Vines being taken outside, and the space at bottom could then be closed by Whitney's prepared calico.‡

Miscellaneous.—*B. F. K.*—Onopordum acanthium is mentioned by Sir W. Hooker as the Scotch Thistle; but we have always supposed it to be Cnicus lanceolatus.—*A. V.*—Twopence each paper.—*Alpha* is answered by Mr. Fleming's paper in last week's *Chronicle.* The Cabul Melons are generally excellent, but no doubt some of the varieties cultivated in Affghanistan are inferior.—*T. W.*—Your questions cannot possibly be answered in a newspaper. We advise you to consult Mr. Glendinning, of Turnham Green, whose opinion you may take with confidence.—*Inquirer.*—There are many substances which cannot be converted into a gaseous form by any known force, such as several of the metals. Nevertheless, it is not improbable that all matter has a gaseous origin, and Professor Lowe, in his late work on the simple bodies of Chemistry, supposes that the only elements of matter may be oxygen and hydrogen.—*A. Y. C.*—Much obliged, but have bought as many Numbers as we want at present.—*J. D.*—Your seedling Azalea has fine flowers, but far too much like other pink ones.—*A Subscriber.*—The kitchen-garden at Kew, or that part containing the Pineries and Forcing-houses, is never open to the public.‡—*H. C.*—Bricks are conductors of heat, but very bad ones, if compared with metals; the difference between them and gold is as about 10 and 1000.—*B. B.*—We do not know how the French stain their boards so as to make them look dark; but a strong infusion of galls washed over wood that had been previously moistened with sulphate of iron would produce a very dark colour.—*Y. E.*—Those who tell you that it is pedantic to call uncommon plants by their botanical names are themselves the pedants. A large part of our wild plants, and most exotics, have no recognised English names, but are sometimes called one way and sometimes another. Their botanical names are the only ones that are stable. It would be pedantic, no doubt, to call the Hawthorn, Cratægus oxyacantha, and to give Latin names to very common plants in common conversation; but with this exception, there is no more pedantry in the matter than in saying Birmingham instead of Brummagem. Those who cry out at Botanical names are they who are ignorant of them, and would have every one else like themselves. You know the fox, when his tail was cut off, tried to persuade his brother foxes that tails were out of fashion, and only stumps the mode.—*M. D.*—An article on the Musicetor will appear in our columns soon.‡—*A Lady.*—The Beechwood is an excellent Melon; seeds of it may be procured from any respectable seedsman.‡—*Micklewell.*—Notice concerning subscriptions for Mrs. Loudon will be given in due time. The Lily with purple backed petals is japonicum.—*A Constant Reader.*—Sorry we cannot answer your question, but you must be so obliging as say to *what* mode of heating you refer? Give us page, &c., and we shall know how to reply. Leaves should be moist, not wet, when they are thrown in a heap to ferment. If mixed with hot dung they moderate its action.—*A Subscriber.*—We cannot tell. You should ask Mr. Groom himself.

*** As usual many communications have been received too late for answering this week.

1844.]

LARCH PLANTS.—One and two years' transplanted, of good size and quality. On Sale by DICKSON & SONS, Nurserymen, Brechin. N. B.—Will be sold cheap, a quantity of plants to London.—Brechin, Feb. 1, 1844.

LARCHES.—The Subscribers have still a Large Quantity of one Transplanted LARCHES of sizes which they offer at very low prices.—WM. URQUHART and SONS, Nurserymen, Elgin.

GRASS SEEDS, FOR PERMANENT PASTURE AND LAWNS.

ROBERT SMITHE, of Eastling, Faversham, Kent, has prepared the above Seed at 8s. per bushel, three bushels per acre, containing all the best sorts, with a good proportion of Clovers and Trefoils properly mixed for the generality of Pastures. Parties are requested to name the soil as the mixture will be adapted to that. Also all other Seeds proportionably cheap. They will be sent to any part of the Kingdom.

The Agricultural Gazette.

SATURDAY, FEBRUARY 3, 1844.

MEETINGS FOR THE TWO FOLLOWING WEEKS.

Tuesday, Feb. 6 . { Agricultural Society of England. / Highland and Agric. Society.
Thursday, Feb 8 . Agric. Imp. Soc. of Ireland.
Tuesday, Feb 13 . Agricultural Society of England.
Thursday, Feb 15 . Agric. Imp. Society of Ireland.

THE PROFITS OF FARMING, whether the land be pasture or arable, and the tenant be a feeder of stock or a tiller of the ground, may be increased in two ways.

The stock-farmer knows very well that the return he obtains from his cattle depends not only on the kind of food given to them and the manner in which it is supplied, but also on the feeding properties of the breed to which they belong; and he increases his chance of profit as much when, on purchasing from the breeder, he selects with judgment, as when he adopts an improved mode of feeding.

The intelligent farmer of arable land, again, expects a greater crop the more he has been able to improve the texture of the soil, and the better the nature and state of the manure which it contains. He expects it, because he knows that it depends on the nature of the food given to the plants, and the manner in which they are provided with a constant supply of it. The crop does not, however, depend wholly on this; for as two beasts fed in exactly the same manner may not be equally profitable, owing to a difference between them regarding the quantity and the quality of the meat they afford, so two different kinds of Wheat, though sown on land precisely similar, may give unequal returns, owing to a difference between them regarding the quantity and quality of the flour they afford. Hence the importance, too often overlooked by farmers, not only of preparing the land for the crop in a good and sufficient manner, but also of selecting that kind of seed which experience has pointed out as being most valuable and productive."

We quote the above from an article by Mr. Morton in the first part of the first volume of the English Agricultural Society's Journal. The parallel between the circumstances affecting the stock farmer and those affecting the corn farmer is true, even when carried into detail. The quality of that which is reared by the one, upon which (if we put out of sight the kind and quantity of food supplied by him) his profits depend, is made up of the same elements as that of the articles reared by the other. An aptitude to fatten—*i. e.*, a capability of producing a large quantity of beef or mutton from the consumption of a given weight and kind of food—and the quality of the beef or mutton so produced, *i. e.*, the price per pound they will command in the market, are the two circumstances which determine, in the eye of the stock farmer, the value, to feed, of any breed of cattle or sheep. And, taking the instance of the Wheat-crop, the corn-farmer, on the other hand, in selecting any variety for cultivation, must not only take into account its productiveness, but also its quality in the eye of the baker.

Little attention has hitherto been applied to that branch of cultivation which refers to the selection of seeds. The branch of farming which constitutes the business of the stock-farmer has received much more attention and more patronage from the noblemen and landowners of the country than the mere art of cultivation; and the consequence is, that the breeding and feeding of stock is generally well understood and skilfully practised, while large districts are still badly farmed. We are therefore glad to see the announcement of a work, by one of the highest we allude to, on this comparatively neglected subject.*

This work is addressed to farmers and bakers. For the benefit of the former, it was necessary to ascertain the extent of the difference existing between various varieties of Wheat, and the degree in which their qualities are affected by the circumstances of cultivation, &c.; for the latter it was important to know how far the criterions by which they at present judge of the value of samples submitted to them, are trustworthy. These two subjects are both considered, and the questions arising out of each are answered in detail, and at the close of "the remarks" the important

* Essays and Remarks on the Subjects connected with the Choice of Wheat for Seed, interesting to Farmers, Corn-factors, and Bakers. By Sir G. S. Mackenzie, Bart., F.R.SS. L. and E., &c. Hogg and Marshall, London.

ance is insisted on of our great Agricultural Societies taking up this and other questions in a manner which alone can ensure their perfect solution, by establishing experimental farms.

The general character of this work is well indicated by the following extracts:—

"The first object I had in view on entering into the present inquiry, was to ascertain whether, under the same circumstances, in reference to soil and climate, different varieties of Wheat were, chemically, differently constituted. This I have ascertained to be the fact, by having had nine varieties which grew together on the same spot chemically examined, viz., the first five in the tables, and the four mentioned in page 9. With respect to Nos. 7 and 8, they are the same variety, the one sown after Potatoes being the richest in gluten and sugar, that sown after pasture-grass the poorest. This result proves what might have been expected from the statement of Liebig, respecting the advantage of stirring and exposing the soil. Long before Liebig had published his works, I had observed the advantages of the stirring which the land receives for the Potato and Turnip crops; and such of my tenants as have followed my advice to make either of these the first crop taken from new land, have found it better than taking Oats, according to the old custom. Liebig has informed us how stirring the earth renders it more productive.

"The next object I had in view was to ascertain whether external appearance and the weight of a given bulk were sufficient to indicate the actual value of Wheat to the baker and starchmaker."

These objects were attained, the first, as stated in the extract, by a chemical examination of certain varieties which had been grown under similar circumstances, and the second by submitting these very samples to the inspection of Corn-factors and obtaining from them opinions of their value. The results of this inquiry are given in the following Table:—

CHEMICAL ANALYSIS OF EIGHT VARIETIES OF WHEAT.

Wheats.	Gluten.*	Starch and Gum.	Sugar.	Bran.	Water.	
1.	17·70	66·50	3·50	2·3	10·00	Pale Red Cape Wheat, 63 lbs.
2.	10·19	69·94	2·77	2·57	14·6	Duck's Bill Wheat, 63 lbs.
3.	20·8	56·8	5·0	2·8	14·6	Black-jointed Tremaine Wheat, 62 lbs.
4.	16·90	66.20	4·50	1·9	10·50	Grano Duro, of which Macaroni is made, 63½ lbs.
5.	20·60	53·04	3·70	2·0	10·60	Grano Tenero St. Brigida, 63 lbs.
6.	15·60	70·25	3·25	1·6	10·30	From Port Adelaide, South Australia, 65 lbs.
7.	17·8	60·0	4·6	3·9	13·6	Red Wheat, sown after Potatoes, 65 lbs.
8.	16·2	60·9	4·2	4·0	14.7	The same after Lea, 65 lbs.

* This Gluten includes all the nitrogenous products of the Wheat.

"The first five were grown on the same spot, all circumstances of soil and climate being the same. Also other four sorts which were examined solely with the view to compare the weight per bushel with the quantity of gluten. The first weighed 64 lbs., and contained, 15·86; the second 61 lbs., and contained 14·64, showing a difference in 3 lbs. per bushel of 1·22 per cent. The third weighed 61 lbs., and contained 9·8; and the fourth, 65 lbs., and contained 10·3; showing a difference in 4 lbs. per bushel of 0·5. It is seen by the tables, that, in equal weight, there is difference of proportion among all the ingredients, so that weight indicates nothing in reference to proportions."
